[On the subject of this article, see Bastiat's *Harmonies of Political Economy*, translated by P. J. Stirling, 1860.] J. N. K.

GRAUMANN, Johann Philip (1690-1762), who in the year 1750 became master of the mint of Frederick the Great of Prussia, had formerly been a merchant in Holland, and carried into his official capacity a shrewd, business-like turn of mind. He established the Prussian monetary system, *preussisch Courant*, of coining fourteen instead of twelve thalers out of one mark of pure silver, in order to prevent the outflow of Prussian currency. In his *Versammelte Briefe von dem Gelde, Wechsel und dessen Curs, von der Proportion zwischen Gold und Silber, von dem Pari des Geldes und den Münzwesen verschiedener Voelker*,

besonders von dem Englischen (Collected Letters on Money, Bills, and the rate of Exchange, the proportion between Gold and Silver, and the monetary systems of various Nations, chiefly of England), which were published in the year of his death, Graumann displays an unmitigated contempt both for "mere savants" and for "mere masters of the mint," although he uses the learned terminology of the former, even in the simplest questions, and generally has in view the aims of the latter. Graumann points out that it is not by any means a matter of indifference whether the rate of exchange is against or in favour of a nation. He finds only three faults in the English monetary system: the abolition of seigniorage, the prohibition to export English coins, and the over valuation of gold.

[See Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 420, also Dana Horton, *Sir Isaac Newton and England's Restrictive Policy towards Silver.*]

E. Ca.

GRAUNT, JOHN (1620-1674), statistician, was one of the earliest English writers to perceive the importance of vital statistics, and to deduce therefrom by scientific methods propositions with regard to the social and economic condition of the country. In 1662 he published a pamphlet in 4to (pp. 16 and 85) which immediately attracted much notice and commendation. It was entitled *Natural and Political Observations, mentioned in a Following Index, and made upon the Bills of Mortality*, by John Graunt, citizen of London. *With Reference to the Government, Religion, Trade, Growth, Ayre, Diseases, and the several Changes of the said City.* He tells us (see *First Ep. Ded.*) that he had "reduced several great confused volumes [of the *Bills of Mortality*] into a few perspicuous tables and abridged such observations as naturally flowed from them into a few succinct paragraphs, without any long series of multiloquious deductions." On the publication of his work, which bore on its title-page the modest epigraph: Non me ut miretur turba, laboro, Contentus paucis lectoribus, it was at once recognised that Graunt had opened up a new and fruitful field of investigation, and, at the king's suggestion, he was elected F.R.S. On 30th June 1665 the council of the Royal Society ordered that the book should be printed for the use of its members. Accordingly a third edition (London, 1665, 8vo) and a "fourth impression" (Oxford, 1665, 8vo) were published. Two years after Graunt's death in 1674, Sir William PETTY brought out a new and enlarged edition (London, 1676, 8vo), a fact which may perhaps in some measure account for the mistake of Evelyn, Burnet, and Stoughton, that Petty was the real author of the work. It was reprinted by Birch in 1759. Graunt especially deserves notice as one of the "beginners of an art not yet polish'd, and which time" would "bring to more perfection" (Davenant). He also published *Observations on the advance of Excise.*

[Graunt's Life, *Dictionary of National Biography.*—The *Assurance Mag.* and *Journal of Inst. of Actuaries* contains a discussion as to the attribution of Graunt's researches to Sir W. Petty. *Vide* articles by Professor de Morgan, and Mr. W. B. Hodge; and by Mr. F. Hendriks *s.v.* Tontines; W. A. Bevan's "Sir W. Petty," *Am. Econ. Assoc.* 1894, review in *Econ. Journal*, March 1895.—Lord Ed. Fitzmaurice, *Life of Sir Wm. Petty*, 1895.]

W. A. S. H.

GRAY, JOHN, LL.D. (18th cent.), assistant private secretary to the Duke of Northumberland in Ireland in 1763-64, wrote *The Essential Principles of the Wealth of Nations*, etc., 1797, noticed in the *Monthly Review; Practical Observations on the Union*, London, 1800, 8vo; and *The Income Tax scrutinised*, London, 1802, 8vo. In the latter, called forth by Pitt's income tax, land is maintained to be the proper object of taxation, and land banks are advocated, with state development of agriculture and the fishing industry. H. E. E.

GRAY, JOHN (19th cent.) of Galashiels and Edinburgh, author of the *Social System, a Treatise on the Principle of Exchange*, 1831 and 1842; *Remedy for the Distress of Nations*, 1842, and *Money*, 1848. His remedy for distress is a change in the monetary system, founded on the principles that production is the cause of demand and labour is the only measure of value. There is a good deal of useful suggestion with criticisms of contemporary economists and statesmen.

GRAY, SIMON (18th and 19th cents. wrote also under pseudonym of George Purves), of the war office, a writer on economics of great pretensions but of less success. He wrote in 1804 his *Happiness of States*, published 1815, including some letters of J. B. SAY (an ed. with additions, 4to, 1819), an attack on the French PHYSIOCRATS and Adam SMITH, whom he misunderstands. It clearly fell flat, for in 1817 he published, under the assumed name of George Purves, *All Classes Productive of National Wealth*, and in 1818, under same name, *The Principles of Population and Production investigated*, the object of both being to advertise the original work, which is constantly quoted and approved. His radical fallacies are the confusion of income with wealth, of the element of price, "chargeability," with productiveness, of expenditure with employment of labour. A few of his statements may serve as examples: "Paper money is the source of new capital, equal to the whole amount in circulation"; "the working classes consume more bread when it is dear than when it is cheap"; a national debt and high taxes enrich a nation; a rapidly increasing population makes future famine unlikely. On the other hand he saw that Adam Smith did not realise the importance of consumption in his scheme of economics, and inveighed against his distinction between productive and unproductive labour.[1]

[1] Later economists have endorsed Gray's opinion on this point (see Marshall, *Principles of Economics*, 2nd ed. bk. ii. ch. iii.). Had Gray been less critical and negative, his remarks might have found fuller acceptance in his own time (refer to Cunningham, *Growth of English Industry and Commerce*, ed. 1892, vol. ii. p. 439).

He also wrote *Remarks on the Production of Wealth*, in a letter to the Rev. T. R. Malthus, 1820—and, under his assumed name, *The Grazier's Ready Reckoner*.—See also Anton Menger, *Das Recht auf den vollen Arbeitsertrag* (2nd ed., 1891). —Roscher, *Pol. Econ.*, trans. Lalor, vol. ii. § 243.

GREAT TITHES. See TITHES.

GREELEY, HORACE (1811-1872), was born in Amherst, New Hampshire. He was the son of a farmer of limited means; self-educated, and at an early age apprenticed as a printer, he finally settled in New York, where in 1841 he established the *Tribune*, of which he was the editor until his death. He was an important counsellor in the whig and republican parties, until dissatisfaction with the administration of President Grant led him to join a revolt and to organise the liberal republican party. By this he was nominated for president in 1871. Greeley was an ardent and consistent protectionist; and no journal did more than the *Tribune* in familiarising the north, and especially the farmer class, with this doctrine. In addition to his editorial work and frequent speeches upon the tariff, mention may be made of an *Introduction*, treating of the present state of the science of political economy and the adaptation of its principles to the condition of our own country, of *Principles of Political Economy*, by William Atkinson, New York, 1843 (Introduction, pp. i.-xv.); and of *Essays designed to elucidate the Science of Political Economy, while serving to explain and defend the Policy of Protection to Home Industry, as a System of National Co-operation for the Elevation of Labour*, Boston, 1870, pp. 384. In the latter, political economy is regarded as an art, "the chief end of a true political economy is the conversion of idlers and useless exchangers or traffickers into habitual effective producers of wealth"; "protection is another name for labour-saving through co-operation." The work is valuable as representing the views of a large part of the more intelligent agricultural population of the northern part of the United States, 1840-1870. See also in *Recollections of a Busy Life*, pp. 528-553, *The Grounds of Protection*. About 1840, Greeley came under the influence of Fourierism; and the doctrine of "association" was often referred to with favour in the *Tribune*. In 1846 occurred a discussion between Greeley and Henry J. Raymond of the *Courier and Enquirer*, running through twenty-four articles. For an abstract, see *Life of Horace Greeley*, by James Parton, New York, 1855, ch. xvi., *The Tribune and Fourierism*. In 1848-1850 Greeley wrote several articles to show how working men may become their own employers and share in profits; in 1850 he published *Hints toward Reforms*, New York, composed of eleven lectures and twenty essays, largely devoted to the emancipation of labour. This phase of his life is referred to in *Recollections of a Busy Life*, by Horace Greeley, New York, 1868, pp. 144-158.

D. R. D.

GREENBACK. This term refers to the legal-tender notes issued by the government of the United States, and so called because the backs of the bills are printed in green ink. They are equivalent to the "legal-tenders" or the treasury notes of the civil war period, as distinguished from the new treasury notes issued under the law of 1890, based upon purchases of silver. There were three issues of greenbacks: Feb. 25, 1862, $150,000,000; July 11, 1862, $150,000,000; and March 3, 1863, $150,000,000 (£30,000,000 each; £90,000,000 in all, converting the $ at 5 = £1). They were at first issued as a war measure, the government at that time being engaged in suppressing the rebellion in the southern states. Many at the time thought that the issue was unconstitutional, and none of the notes issued previous to the civil war had ever been made legal tender. The supreme court, however, has held that congress has power to impress upon the treasury notes the quality of legal tender not only in times of war but also in times of peace. At the close of the war a portion of the issue was withdrawn, but there was a strong popular opposition to the contraction of the currency, and consequently by the act of March 31, 1878, the treasury department was forbidden to reduce the amount then current in circulation, $346,681,016.

The term "greenback" was also given to a political party which appeared in 1874, and was hostile to the national banks. It opposed the withdrawal of the greenbacks, and in part advocated the payment of the United States debt in greenbacks instead of in gold.

After the early issues the government was obliged to suspend their payment, and the greenbacks circulated at a discount until 1879. For an accurate history of the greenback issues, see *History of United States Notes*, by John Jay Knox.

GREENLAND COMPANY. During the reign of James I. the whale fisheries first came into notice. After being noted as sources of considerable profit for some time, a period of decay seems to have set in, for in 1693 complaint was made of their fall from their former high position. It was urged that the only available means of revival lay in the formation of a joint-stock company. Accordingly, on 1st October 1693, Sir William Scawen and forty-one others were incorporated as a company of merchants of London trading to Greenland. Their exclusive rights were to cease after the lapse of fourteen years from the date of the incorporation. The enterprise was not a success, and no application was made for the renewal. After the failure of the company various other expedients, as, for instance,

bounties to private traders, were employed for the purpose of stimulating the whale fisheries.

E. C. K. G.

GREG, WILLIAM RATHBONE (1809-1881), born at Manchester, was educated at Bristol under Dr. Lant Carpenter, and at the university of Edinburgh. In 1832 he entered business, from which, however, he retired in 1850. In 1856 he was appointed one of the commissioners of customs, and in 1864 comptroller of the Stationery Office, a position which he held till 1877.

Though Greg's writings contain no positive contributions to economic knowledge, they are full of suggestive criticism and written in a frank easy style. The various subjects of which he treats are canvassed from all points of view, and the theories relative to them explained with the object of discovering the truth or rather the error which they contain. Though he did not deny the advance which had been made in general economic comfort, Greg was more acutely conscious of the difficulties in the way of sound economic and social progress. These he rather overestimates, while on the other hand he underestimates the importance of those economic influences of society which insensibly control the economic individual and modify the evils menaced by a too exclusive devotion to self-interest. His views on Malthusianism deserve mention.

Greg sometimes used the pseudonym of *Cassandra*. His chief writings relating to economic or semi-economic subjects were, *Political Problems of our Age and Country* (1870).—*Enigmas of Life* (1872).—*Rocks Ahead* (1874).—*Mistaken Aims and Attainable Ideals of the Working Classes* (1876).

E. C. K. G.

GRENIERS À SEL. These were established in France in 1342 for levying and collecting the GABELLE (*q.v.*), or tax upon salt. All salt manufactured in France had to be taken to the *grenier* of the province under penalty of confiscation. The *grenier* fixed the producer's price, and sold the salt at a much increased rate to the retail dealers, who were called *regrattiers*. The *grenier* was also a court of justice to decide all disputes arising in connection with the *gabelle*. In the 18th century there were seventeen *greniers à sel*, which were all abolished with the *gabelle* in 1790.

[Clamagéran, *Histoire de l'Impôt en France.*]

R. L.

GRENIERS D'ABONDANCE (France). At all periods of French history it has been the custom to create reserves of the surplus production of corn in years of abundance to meet the deficit in years of scarcity. Such stores were usually formed by the religious communities, but in 1577 a royal ordinance enjoined the local authorities to establish public granaries (*greniers d'abondance*) to hold a minimum of three months' consumption, and authorised them to borrow money at interest for the purpose. No records exist, however, of the extent to which the measure was carried out. Under Louis XV. difficulties appear to have arisen in ensuring a regular supply of bread to the capital, for the government then purchased the great mills and storehouses at Corbeil near Paris to hold a permanent reserve of 25,000 sacks of flour. During the revolutionary period the government had again to intervene in the food supply of Paris by the purchase of 1200 to 1500 sacks of flour daily, which were sold to the bakers at 10 to 15 per cent below their cost price. One effect of that measure was that merchants ceased entirely to send corn to the market, and the bakers became wholly dependent on the government for their supplies; another consequence was that the inhabitants of the region around the capital flocked to Paris to purchase bread. Stringent measures were adopted against the intruders, but bread was nevertheless sold to them secretly, and the consumption in Paris rose from 1500 to 1900 sacks of flour daily. A first step was taken to compel citizens to obtain a card without which bread would not be delivered to them, and this was followed by a decree fixing rations according to the number of the family. M. Thiers describes in his *History of the French Revolution* the scene at the bakeries at the time. A long rope was stretched out from the door to be held by the hand by the people as they waited for their turn; the women would sometimes cut the cord and there was then a rush and a struggle, and armed force had to be called in to restore order. Various other measures were adopted as the necessity for them arose. In 1793 the National Convention ordered the creation of public granaries in each district of Paris, and voted a sum of 100,000,000 livres to stock them. In 1807 Napoleon I. commenced the construction of the immense range of buildings called the *grenier d'abondance* on the south bank of the river at the eastern end of Paris. It covered a space of two acres, and was intended to be six stories high, with mills worked by water power from the Seine in the basement. This magazine was to contain a three months' supply of 180,000 sacks of flour, constantly renewed. The service was, however, never organised, nor was the building ever terminated. Lofts were raised over the ground floor and roofed in, and the whole served for a long time as a warehouse for the stores the bakers were bound to keep as a condition of their privileges, the trade having become a monopoly with the number of shops limited in proportion to the number of inhabitants. The building was burnt during the fighting in Paris on the suppression of the commune, and was not rebuilt. The use for it had ceased, as the trade had been made free in 1863, and all the-

regulations relating to the compulsory reserves abolished. That the magazine was wilfully destroyed was proved by a document afterwards found in one of the mairies, in which the colonel of one of the insurgent legions reports, "I have set fire to the *grenier d'abondance*." All that now remains of the former restraints on freedom of trade in food supplies are Art. 420 of the Penal Code, which punishes by two months' to two years' imprisonment, and fines of from one to twenty thousand francs, all manœuvres or coalitions to raise or reduce the prices of corn, flour, or bread; and Art. 30 of the Municipal Law of 1791, which empowers the mayors of communes to fix the prices of bread and meat, while, however, expressly forbidding the regulation of the price of corn or cattle. This law is still applied in many localities, and attempts to revive it at Marseilles in 1893, and more recently at St. Denis, led to strikes of the bakers, who closed their shops for several days rather than submit to it. T. L.

GRENVILLE, GEORGE (1712-1770), was the son of Richard Grenville of Wotton, and his wife Hester, Countess Temple. He was educated at Eton and Christchurch, Oxford, and trained for the bar. Forsaking the law for politics, he was elected M.P. for Buckingham in 1741, and continued to represent that constituency until his death. After holding minor appointments, in 1754 he became treasurer of the navy. In this capacity he effected a useful reform by passing the Navy Bill, which provided for the speedy and punctual payment of seamen's wages. In May 1762 Grenville was appointed secretary of state; he already held the leadership of the House of Commons. Five months later, however, he was compelled to resign the leadership and the seals, and accepted the post of first lord of the admiralty. He supported Dashwood's unpopular cider tax, on the ground that the profusion with which the late war had been carried on necessitated the imposition of fresh taxes. Grenville became first lord of the treasury and chancellor of the exchequer in April 1763. His fiscal policy precipitated the disastrous war with America, while he lost popularity by the prosecution of John Wilkes. When the famous "No. 45" of the *North Briton* appeared, he caused Wilkes to be arrested under a general warrant. The constitutional struggle which ensued involved ministers in an expenditure of £100,000, besides bringing upon them much odium. In the session of 1764 Grenville brought forward a series of resolutions asserting the right of the imperial legislature to impose taxation on the colonies. The proceeds of these duties were to be paid into the imperial exchequer, and to be applied under the direction of parliament "towards defraying the necessary expenses of defending, protecting, and securing the British colonies and plantations." The Commons also resolved that "it may be proper to charge certain stamp duties" in America. Grenville allowed a year to elapse before embodying the resolutions in a bill; but in 1765, in spite of the unanimous protests of the American colonies, the Stamp Act was carried, imposing customs duties upon the importation into the colonies of various foreign products. The act excited such discontent in America that the matter was again forced upon the attention of parliament in 1766. Pitt, in one of his most brilliant speeches, insisted that taxation without representation was illegal, but while he urged the immediate repeal of the tax, he proposed to uphold the dignity of the mother country by asserting the general legislative authority of parliament over the colonies. Grenville defended his ill-fated measure with vigour, but in the end the Stamp Act was repealed, while several of the obnoxious duties imposed in 1764 were withdrawn, and others modified. As Grenville had blundered over the Regency Bill, and was generally distasteful to the king, he was dismissed from the premiership in July 1765. Townshend, the chancellor of the exchequer, having proposed in 1767 to continue the land-tax for one year at 4s. in the £, Grenville carried a motion reducing the tax to 3s., by which the budget sustained a loss of £500,000. It is stated that this was the first occasion since the revolution on which a minister had been defeated upon any financial measure. As the result of his study of economical questions, Grenville wrote in conjunction with William Knox a treatise on *The Present State of the Nation; particularly with respect to its Trade, Finances, etc. etc., addressed to the King and both Houses of Parliament* (1768). This pamphlet was noticed by A. Smith, *Wealth of Nations*, bk. iv. ch. i., and drew a reply from Burke. Grenville had taken a leading part in the early measures against Wilkes, but being convinced of the futility of a struggle between the House and the electors of Middlesex, he opposed his expulsion from the House of Commons in 1769, in a speech which was the most effective delivered in favour of the constitutional rights of electors. To remedy the evils connected with the trial of election petitions, early in 1770 Grenville introduced his celebrated measure, known as the Grenville Act, which forms "a landmark in parliamentary history" (May's *Constitutional History*). This admirable reforming measure transferred the trial of election petitions from the House at large to a select committee, empowered to examine witnesses upon oath. The act was in the outset passed for one year only, but it was renewed from time to time, and made perpetual in 1774. This act is now repealed, and election petitions referred to judges who report to the house. Grenville attended parliament through the session of 1770, but died on the 20th of November in that year. He was a

capable statesman, had a thorough knowledge of the constitution, and exhibited much financial ability; but he was stern in manner, extremely obstinate, destitute of tact, and governed by a boundless ambition.

[*Parliamentary History.*—*Grenville Papers.*—Walpole's *Memoirs.*—The *Histories* of Stanhope Lecky, and May (Lord Farnborough).—M'Culloch, *Literature of Pol. Econ.*] G. B. S.

GRENVILLE, William Wyndham, Baron Grenville (1759-1834) was the youngest son of George Grenville by his wife Elizabeth, daughter of Sir William Wyndham, Bart. He was educated at Eton and Christ Church, Oxford. Elected M.P. for Buckingham in 1782, in the ensuing year he accompanied his brother Earl Temple to Ireland, as private secretary. Appointed paymaster-general in December 1783, he now gave his cousin Pitt valuable aid in the House of Commons. He devoted himself to the study of financial and commercial questions, was made one of the commissioners of the newly-created board of control, and in September 1786 vice-president of the committee of trade. For a few months of 1789 Grenville filled the position of speaker, resigning the office to become home secretary. In March 1790 he became president of the board of control, and in the following November was created Baron Grenville. He had the conduct of the government business in the House of Lords. He was appointed foreign secretary in 1791, in which office he continued for ten years, resigning his seat at the board of control in 1793. Grenville thoroughly carried out Pitt's foreign policy, and rejected all the overtures of the revolutionary government of France. In 1792 he introduced the Alien Act for the registration and supervision of all foreigners in the country, and in 1795 the Treasonable Practices Act and the Seditious Meetings Act. In 1799 he moved the resolutions for the Union with Ireland in a speech occupying four hours, "putting the arguments on strong grounds of detailed political necessity" (Lord Colchester's *Diary*). With regard to his position as a political economist he wrote a letter to Pitt in October 1800, protesting against tampering with the laws of supply and demand, and reminding him that "we in truth formed our opinions on the subject together, and I was not more convinced than you were of the soundness of Adam Smith's principles of political economy till Lord Liverpool lured you from our arms into all the mazes of the old system" (Stanhope's *Life of Pitt*). Grenville was a warm supporter of the Roman Catholic claims, and having drawn up an emancipation scheme which was rejected by the king, he resigned with several other members of the cabinet (February 1801). On the downfall of Addington in 1804, Grenville formed with Fox the Ministry of "All the Talents." In 1807 Grenville carried an act for the abolition of the slave trade, and it received the royal assent the very day ministers went out of office on the Roman Catholic question (25th March 1807). As auditor of the exchequer Grenville refused to issue public money during the incapacity of George III. Parliament was appealed to, and both Houses passed a resolution authorising and commanding the auditor and officers of the exchequer to pay obedience to treasury warrants for the issue of such sums as had been appropriated for the services of the army and navy, as well as money issuable under a vote of credit for £3,000,000. The money was paid, but a protest was entered in the Lords' journals, signed by twenty-one peers, affirming the measure to be unconstitutional, and one that might have been avoided, without injury to the public service, by an address to the Prince of Wales. Grenville strongly opposed the Corn Importation Bill of 1815, and with nine other peers signed a protest drawn up by himself and Lord Wellesley, declaring their opinion that "public prosperity is best promoted by leaving uncontrolled the free currents of national industry" (see Rogers's *Protests of the Lords* and M'Culloch's ed. *Wealth of Nations*, 1853, p. 523, for the protest). Grenville resisted various overtures to take office, as his high sense of honour prevented him from doing so except in a cabinet pledged to deal with Roman Catholic emancipation. His last speech in the House of Lords (21st June 1822) was in support of the Duke of Portland's Roman Catholic Peers Relief Bill. In 1828 Grenville wrote an *Essay on the supposed advantages of a Sinking Fund*, of which only the first part was printed, and privately issued. Grenville died at Dropmore in Buckinghamshire, on 12th January 1834. As a statesman he was distinguished for industry, honesty, and an unusual capacity for business; and as a speaker he was weighty, lucid, and argumentative.

[*Parliamentary Debates.*—The various *Memoirs* of George III. and George IV.—Sir G. C. Lewis's *Administrations of Great Britain*, 1783-1830.—Lord Colchester's *Diary.*—Yonge's *Life of Lord Liverpool.*—Brougham's *Statesmen of George III.*] G. B. S.

GRESHAM, Sir Thomas, *c.* 1519-1579, was the second son of Sir Richard Gresham, merchant; he was educated at Gonville Hall, Cambridge, apprenticed to his uncle Sir John Gresham, also a merchant, and admitted a member of the Mercers' company in 1543. In 1551 or 1552 he became royal agent or king's factor at Antwerp, in which post he received twenty shillings a day, and which he retained with few intervals during three reigns until 1574, employed in spite of his Protestant views even by Mary. His business was to negotiate royal loans with Flemish merchants, to buy arms and military stores, and to smuggle into England as much bullion as possible. He succeeded in raising the rate of exchange from

16s. to 22s. in the £, and is said to have saved in this way 100,000 marks to the crown and 300,000 to the nation. His operations greatly benefited English trade and credit, though the government could not be induced to pay its debts as punctually as Gresham would have liked. He did not hesitate to remonstrate with and advise Elizabeth and Cecil; but he was so useful and trustworthy that he was never seriously out of favour, except just after Mary's accession. On Mary's death he advised Elizabeth to restore the base money, to contract little foreign debt, and to keep up her credit, especially with English merchants. Later he taught her how to make use of these English merchants when political troubles in the Netherlands curtailed her foreign resources; at his suggestion the Merchant Adventurers and Staplers were forced by detention of their fleets to advance money to the state; but as they obtained interest at 12 per cent instead of the legal maximum of 10, and the interest no longer went abroad, the transaction proved advantageous to all parties and increased Gresham's favour. His journeys to and from Antwerp were very frequent, but in his later years he entrusted most of his public work to his agent, and is not known to have been at Antwerp after 1567. In 1554 he was sent to Spain to procure bullion, a very difficult task in which he was only partially successful; and in 1559 he was employed as ambassador to the Duchess of Parma, regent of the Netherlands; it was on this occasion that he was knighted.

In addition to his public services he continued throughout his life to do the work of "the greatest merchant in London." He was, in the language of the day, a banker and goldsmith, with a shop in Lombard Street, as well as a mercer; but he was a considerable country gentleman besides, with estates, chiefly in Norfolk, where his father held considerable property (see Blomefield, *Norfolk*), and with several country houses besides the house in Bishopsgate which he built and bequeathed to London as Gresham College. He twice entertained Queen Elizabeth as his guest. His wealth was mainly earned by his private business, but he cannot be acquitted of enriching himself at the public expense by at least one dishonourable manœuvre; and he habitually forwarded his schemes by bribery. The money so gained he applied to public uses, his only son having died young: the foundation of the royal exchange, of Gresham College, and of eight almshouses, and the establishment of the earliest English paper-mills on his estate at Osterley, show the breadth of his interests, his liberality, his charity, his culture, and his commercial enterprise (see EXCHANGE as BOURSE; GRESHAM'S LAW).

Gresham.] E. G. P.

GRESHAM'S LAW. This familiar term was introduced by MacLeod in 1858 (*Elements of Political Economy*), and has since been generally accepted by economists.

It denotes that well-ascertained principle of currency which is forcibly though not quite adequately expressed in the dictum—"bad money drives out good." It has also not infrequently been explained by the statement that where two media of exchange come into circulation together the more valuable will tend to disappear. The principle in its broadest form may be stated as follows:—Where by legal enactment a government assigns the same nominal value to two or more forms of circulatory medium whose intrinsic values differ, payments will always, as far as possible, be made in that medium of which the cost of production is least, and the more valuable medium will tend to disappear from circulation; in the case where the combined amount in circulation is not sufficient to satisfy the demand for currency, the more valuable medium will simply run to a premium.

This is a principle which obviously has its roots in the ordinary instincts of commercial life, and the cases in which it has asserted itself may be divided into those where (1) of two media intrinsically good, one is by error undervalued; where (2) it is sought to keep a debased metallic currency in circulation on a par with that of a better metal; where (3) an inconvertible paper has been made to run by the side of a metallic currency. The reference to paper suggests the observation that the circulation of convertible paper side by side with, and as "the shadow of" gold, is explained by reference to a different principle.

The dictum above quoted appears to have been used first in the proclamation of 1560 respecting the decrial of the base silver coin; and we know that Sir Thomas Gresham took a prominent part in advising Queen Elizabeth and Cecil on the reform of the currency. (See Burgon's *Life and Times of Sir Thomas Gresham.*) We do not, however, find the principle stated in his own handwriting.

The actual instances of the operation of the law are numerous, and we shall cite only a few. MacLeod quotes Aristophanes, *Frogs*, as the earliest instance of its recognition. Amongst many in the history of the United Kingdom, besides the prevalence of debased silver which formed the occasion of Gresham's dictum, we may cite the following from Lord Liverpool, referring to the over-valuation of silver prior to the reign of James I.

"It is certain that the rise in the value of

Gold made by James I. in the 2nd and 3rd year of his reign was rendered necessary by the exportation of the Gold Coin, which had for some time been experienced, and by the very small quantity of it that was then left in circulation. This rise . . . produced a partial and temporary relief . . . but [Stowe] confesses that this plenty of Gold coin did not continue in circulation for any length of time, and that it afterwards began to be exported. It soon became evident that the last-mentioned rise of the value of Gold in the Coins of this Kingdom was not sufficient to make it equal to the relative value of Gold to Silver at the market."

In Mr. Chalmers's recent work on the *History of Colonial Currency*, we have without difficulty noted eighteen instances, and there are many more. In a pamphlet of 1740 on the *Currencies of the British Plantations in America*, we have the following:—"In sundry of our Colonies were enacted laws against passing of light Pieces of Eight. These laws not being put into execution, heavy and light Pieces of Eight passed promiscuously; and, as it always happens, a bad currency drove away the good currency; heavy Pieces of Eight were shipped off." And on this Mr. Chalmers comments as follows:—"Imitating the practices familiar to them in England, dishonest persons traded on the desire of the young communities for a metallic currency, by circulating clipped money at the full rate; and this malpractice was condoned by the Colonies when it was found that the light money was more apt to stay with them than 'broad' pieces." So that throughout the 17th and 18th centuries in the American and West Indian colonies we constantly find a debased currency in possession of the field. Again, when the Treasury tried to introduce sterling into the colonies in 1838, and wrongly valued the dollar for concurrent circulation with the shilling, "by a familiar law, the over-rating of the dollar sufficed to drive out the shillings" which had been shipped from Great Britain.

In the case of the United States we have excellent instances both in the effect of the legislation of 1837 as driving out silver dollars, and in the way in which the inconvertible "greenbacks" formed the chief part of the currency from 1864 to 1879.

[*Elements of Political Economy*, H. D. MacLeod, London, 8vo, 1858, p. 477.—Bi-metallism, id. *ibid.*, 1893. Essay by Dr. Giffen in *Economic Journal*, vol. i. p. 304, explaining common misinterpretation of Gresham's Law.] C. A. H.

GRIFFITH'S VALUATION is the name popularly given to the government valuation of Ireland from Sir R. Griffith under whose directions it was carried out. The first act, passed in 1826 (7 Geo. IV. c. 62), laid down a scale of prices as a basis for valuation, which was by townlands.[1] Subsequent measures, partly necessitated by the introduction of the poor law in 1838, amended the original system, but the existing valuation, commencing with Munster in 1848 and ending with Armagh in 1865, was at first carried out under an act of 1846 (9 & 10 Vict. c. 110), and later on under one of 1852 (15 & 16 Vict. c. 63), which last revised the very low scale of prices fixed in 1826 and hitherto retained. The authority of Griffith's valuation—at one time highly esteemed—is now completely discredited not only as a guide for fixing rents, which it was not intended to be, but even as a standard for taxation. The prices assumed by it are not those now existing; no adequate account is taken of the yield of land, and the different bases of the acts of 1846 and 1852 make the valuation unfair as between the localities affected.

[For origin of system see Seebohm, *Village Comm.*, ch. vii.] C. F. B.

[1] The smallest local division. There were 60,644 townlands in Ireland in 1881.

GRIST TAX. See MACINATO.

GROAT. See FOURPENCE.

GROSCHEN (COIN). In German countries the word groschen was originally applied to any large or thick coin. Record exists of gold groschen having been coined as early as the year 1232. The name was, however, more commonly applied to silver coins. The value of the silver groschen varied considerably, as, in addition to there being several kinds of these coins, the weight and fineness of each particular kind was not constant. Their history, in fact, presents a record of more or less continuous debasement, similar to that so frequently met with in tracing the life of coins which have been in use for centuries (*e.g.* crown, denier, groat, livre, penny). The greed or the pecuniary difficulties of successive rulers led to the lowering of the coins either in weight or fineness, until a coin which was, as already mentioned, at one time made of gold, ended its career as one of the smallest silver coins of Germany, with a value of only $\frac{1}{90}$th of a thaler (or approximately $1\frac{1}{8}$th of a penny).

No indication of the nominal value of groschen is to be found on the older coins, though it is generally placed on the more modern pieces.

Silver groschen are not now struck. The following list, however, gives the particulars of those in use in Prussia, Saxony, and Austria during comparatively recent years.

PRUSSIA.

(*Under the Law of 30th September 1821.*)

Silver Coin.	Weight (grammes).	Millesimal Fineness.	Value in German Marks.
Groschen ($\frac{1}{30}$ thaler) . .	2·1924	222·222	0·0877
Half-groschen ($\frac{1}{60}$ thaler) . .	1·0962	222·222	0·0438

(*Under the Law of 4th May 1857.*)

Silver Coin.	Weight (grammes).	Millesimal Fineness.	Value in German Marks.
Groschen ($\frac{1}{30}$ thaler) . .	2·1959	220	0·0870
Half-groschen ($\frac{1}{60}$ thaler) . .	1·0979	220	0·0435

On the introduction in 1873, under the act of the 9th July of that year, of the imperial German coinage, with the gold mark as the standard of value, the coinage of groschen was discontinued. The new law, however, provided for the coinage of nickel pieces of the nominal value of 10 pfennige (0·1 mark), and these coins, which have taken the place of the old silver pieces, are commonly spoken of as groschen.

SAXONY.

(*Under the Law of 20th July 1840.*)

Silver Coin.	Weight (grammes).	Millesimal Fineness.	Value in German Marks.
Two new groschen ($\frac{1}{15}$ thaler) .	3·1181	312·500	0·1754
New groschen ($\frac{1}{30}$ thaler) . .	2·1260	229·167	0·0877
Half new groschen ($\frac{1}{60}$ thaler) .	1·0630	229·167	0·0438

(*Under the Law of the 19th May 1857.*)

Silver Coin.	Weight (grammes).	Millesimal Fineness.	Value in German Marks.
Two new groschen ($\frac{1}{15}$ thaler) .	3·2206	300	0·1739
New groschen ($\frac{1}{30}$ thaler) . .	2·1004	230	0·0870
Half new groschen[1] ($\frac{1}{60}$ thaler) .	1·0502	230	0·0435

Prior to 1840 the groschen represented $\frac{1}{24}$th of a thaler. The coin weighed 1·9856 grammes, and was composed of silver of the millesimal fineness of 368. Its value in modern German marks is equal to 0·1315 mark.

AUSTRIA.

(*Under the Convention of 21st September 1753.*)

Silver Coin.	Weight (grammes).	Millesimal Fineness.	Value in German Marks.
Kaisergroschen, or 3-kreutzer piece	170·10	343·750	0·1053

No provision was made in the currency law of 29th April 1852 for the coinage of silver groschen; the smallest Austrian silver coin issued under that law being a ten-kreutzer piece.

[1] The coinage of these pieces was discontinued in 1861, when their place was taken by the copper 5-pfennige piece.

[Friedrich Noback, *Münz, Mass, und Gewichtsbuch*, Leipzig, 1879.—*Groschen-Cabinet*, Leipzig, 1749.] F. E. A.

GROSS AND NET. The word "gross" has sometimes been used by economists as a synonym of "total" or "aggregate." J. S. Mill, for instance, often means by "gross produce" total or aggregate produce as opposed to average or *per capita* produce (see, *e.g.*, *Principles*, I. xiii. § 2 *ad fin.*), and by "gross profit" the absolute amount of profits as opposed to the rate of profit (*e.g.*, *Essays on some Unsettled Questions*, etc., p. 92; *Principles*, iv. iii. § 3). Generally, however, "gross" has been used as a correlative of "net"—the net profits, rent, and produce being what is left of the gross profits, rent, and produce after certain deductions have been made. In the case of profits the terms are not properly applicable, since profits are themselves net receipts, *i.e.*, what is left of the gross receipts after all the cost of obtaining them has been deducted. Consequently the term "gross profits" has never attained any precise sense; it must be variously interpreted according to the context in which it appears. "Gross rent" is the amount of rent paid to the landlord by the tenant, and net rent is the amount left to the landlord after he has paid all expenses of management and repairs (*Wealth of Nations*, II. ii.); "rent" alone usually means in economic works the net rent, while in statistics it means the gross rent. As to the proper application of the terms gross and net produce there was formerly considerable difference of opinion. The PHYSIOCRATS (*q.v.*) held that rent was the only net produce of a country, and looked on profits and wages as merely a part of the necessary expenses of obtaining this net produce. Adam Smith defined "gross revenue" as the whole annual produce, and "net revenue" as what remains of this after deducting the expense of maintaining fixed and circulating capital; by this definition "net revenue" is made to include the whole of profits, wages, and rent. But Ricardo in his *Principles*, ch. xxvi. "on gross and net revenue," excluded wages from net revenue, apparently on the ground that they consist entirely of necessaries, so that no contributions to the state nor additions to capital can be made from them. James Mill (*Elements*, ch. iv. § 1) adopted the same view in spite of a protest by Malthus (*Political Economy*, 1st ed. pp. 423-425) against it. J. S. Mill (*Essays*, pp. 88, 89) calls it the usual doctrine, and suggests that it should be amended by including in the "net produce" so much of wages as is over and above the smallest amount necessary for maintaining the existing number of workers. Later writers seldom use the terms gross and net produce or revenue, but treat the unqualified "produce" and "revenue" as equivalent to Adam Smith's net revenue. E. C.

GROTIUS, HUGO (Huig van Groot, 1583-

1645), was born at Delft; at the age of eleven he became a student of the university of Leyden, and early distinguished himself as a classical scholar. At fifteen he entered public life, accompanying an embassy to the French court. On his return he practised law, and was made advocate-general of the FISC for the provinces of Holland and Zeeland in 1607, and pensionary of Rotterdam in 1613. In the religious and political disputes of his country, Grotius supported the party of the "Remonstrants," the party of Arminianism and toleration in religion, and of oligarchic republicanism in politics. In 1618 he was arrested along with J. van Olden Barneveldt, the leader of the Remonstrants, and while the latter was put to death, Grotius was sentenced to imprisonment in a fortress for life. Escaping by the stratagem of his wife, who had him carried out in a chest supposed to contain his books and dirty linen, he crossed the frontier in disguise and made his way to Paris in 1621. He received a pension, nominally at least, of 3000 livres from the King Louis XIII. In 1634 he was appointed Swedish ambassador at the French court. In 1645 he resigned this post and retired to Stockholm; but dissatisfied with life there, he crossed over to Germany and died at Rostock in the same year. Grotius was distinguished as an historian, a scholar, an elegant writer of Latin verse, and a tolerant theologian who sought to reconcile Catholic and Protestant, and wrote commentaries on the Scriptures in the spirit of scholarship rather than of dogmatic theology. His *De Veritate Christianæ Religionis* was published in 1627; his *Annotationes* on the Old and New Testaments between 1641 and 1646. But his greatest fame was won in jurisprudence. Already in 1604 he had written a book *De Jure Prædæ*, which he did not publish, the MS. of which was only discovered in 1868. This work was suggested by his practical experience: he had had to argue for the lawfulness of the capture of a Portuguese galleon by the Dutch East India Company. The short treatise called *Mare Liberum* (printed in 1609) was a chapter of this work: against the Portuguese claim to the eastern waters, he asserted that the ocean was free to all. When disputes about the control of the sea arose afterwards between the Dutch and the English, Selden wrote his *Mare Clausum* (published in 1635) in answer to Grotius. The *De Jure Prædæ* was the germ out of which grew the *De Jure Belli et Pacis*, published at Paris in 1625. Grotius himself tells us that the license which he saw prevailing throughout the Christian world both in the making and in the carrying on of war—it was the time of the Thirty Years' War—was the motive which induced him to undertake his great work (*De Jure Belli*, Proleg. 3, § 28). Parts of the subject he admits had previously been treated of by some of the schoolmen, and by more recent theologians and lawyers; but his chief predecessors were, as he says, Albericus Gentilis (*De Jure Belli*, 1589), and Balthazar Ayala (*De Jure et Officiis Bellicis*, 1597). But Grotius may be said to have practically created a new science, "the law of nature and of nations," which in his own lifetime became a subject of academic teaching, and to have written a book on this subject which has attained greater fame than any that has been written on it since. BENTHAM, who attacked the idea of a law of nature, introduced for the law of nations the term "INTERNATIONAL LAW" (*q.v.*). Throughout the 17th and 18th centuries the treatise of Grotius exercised an enormous influence on ethical and legal thought. It came to be less studied only when many of its main principles had been accepted by the more civilised nations, and when the sometimes irrelevant erudition and elaborate citations from ancient authors, which were the fashion of the early 17th century, made it distasteful to a later age. Grotius himself defended his use of the testimonies of philosophers and historians on the ground that they supply evidence of that consent of mankind to which writers on the *jus naturæ* and *jus gentium* were in the habit of appealing; he admits that his quotations from poets and orators are introduced rather for purposes of ornament. Grotius, while professedly basing his theories on reason and on fact, has still much of the scholastic reverence for authorities—Aristotle, the Bible, the Fathers, the Roman Jurists, the schoolmen themselves; though he has departed from the scholastic minuteness of argumentation and is saturated with the "classical" learning of the Renaissance. It may be said of Grotius and of his less literary follower Pufendorf that for the Protestant countries of Europe they took the place which the great schoolmen from AQUINAS to Suarez occupied in the Roman Catholic world. When the inevitable reaction against the authority of the name of Grotius began, his critics, such as Paley and Dugald Stewart, forgot that Grotius did not profess to write a complete treatise on ethics and jurisprudence, and that he expressly disclaimed treating the subject of politics. His professed subject is what his title indicates: and the order of the words in the title is also significant,—the phrase, it may be noted, is incidentally used in a passage Grotius quotes from Cicero. But it is only the last part of his third book and the last few chapters of his second that deal strictly with the subjects of international law, *i.e.* with the principles regulating the intercourse of nations in war and in peace. The rest of the work is all intended to lead up to this subject. In bk. i. he treats of the origin of rights and laws in general, discusses the question raised by some Christian writers whether any war is just, deciding that some wars are not contrary to the law of nature or

even to the positive divine law. In order to distinguish between public and private war he explains the nature of sovereignty with its different forms and degrees. He then goes on to consider the duty of subjects to superiors, denying the doctrine that the people is everywhere sovereign and that everywhere subjects may be justified in rebelling (see ALTHUSIUS). Grotius qualifies his precept of non-resistance only in cases where the rulers have by the constitution a limited power, or where a legally absolute ruler uses extreme cruelty or practically abdicates (see HOBBES). In bk. ii., in order to discuss all the causes from which war may arise, he examines what things are common, what are property, what is the right of persons over persons, what obligations arise from ownership, what are the rules of royal succession, what rights are obtained by pact or contract, what is the force and interpretation of treaties and of oaths, what is due for damage done, what is the sacredness of ambassadors, the right of burying the dead, and the nature of punishments. Bk. iii. "has for its subject, first, what is lawful in war: and when it has drawn a distinction between what is done with impunity and may even in dealing with foreigners be defended as consistent with justice (*jus externum*) and that which is really free from fault (is in accordance with *jus internum*), it then comes to treat of the kinds of peace and convention in war." It will be obvious even from this brief enumeration of contents, adapted from Grotius's own summary (Proleg. 4, §§ 33-35), that though recognising the distinctions, Grotius has not separated law from ethics nor public from private law.

Of economic questions he does not directly treat. His interest for the economist, apart from his reference to such questions as property, usury, etc., comes mainly from the direct and indirect effect of his conception of the law of nature (see JUS NATURALE). In his use of the term *jus gentium*, Grotius combined the original Roman meaning of it, the customs and principles of right common to different political societies, with a use of the term which was not Roman, as =*jus inter gentes*, the usages recognised as right between independent political societies as quasi-persons, —a confusion of meanings theoretically very misleading, but practically beneficial, since it enabled Grotius to read into questions of international intercourse the humane principles of the Roman *jus gentium* as modified by philosophical ideas about a law of nature.

Grotius, influenced partly by the biblical narrative, partly by classical traditions, and partly by what he had heard of the simple life of barbarous races—such as "certain peoples of America,"—imagined a primitive state in which everything was common. Departure from primitive simplicity and innocence and the growth of agriculture and other arts made private property necessary. It originated by a certain pact, either express, as by division, or tacit, as by occupation (ii. 2, § 2). "Original acquisition might of old, when the human race could meet together, be made by division: nowadays it is only made by occupation" (ii. 3, § 1). Thus for all practical purposes Grotius follows the Roman jurists in basing the right of property on occupation. The suggestion of the jurist Paulus that property may also arise from the making of new things — an anticipation of LOCKE (*q.v.*), who bases property on labour— Grotius puts aside on the ground that "making" presupposes either previous ownership of the material, or acquisition of it by occupation: otherwise what we make is not ours (ii. 3, § 3). With regard to the ocean, the reason why communism was given up does not exist: it is great enough to suffice for all people (ii. 2, § 3), and moreover it cannot properly be occupied, as lakes or even rivers can, and being largely unknown at the first division of the earth, it could not be divided, and so could only become property now by occupation. So far as small portions of the sea — *e.g.*, bays, estuaries, straits,—can be occupied, they may by the law of nature become the property of nations, and even of individuals, or may be divided between several (ii. 3, § 8); but even such ownership may be contrary to the law of nations—*i.e.* consent or custom (ii. 3, § 10). Thus it was part of the Roman *jus gentium* that the sea was common to all men (*ib.* § 9).

In his chapter "On Contracts" (ii. 12) Grotius does not advance beyond ARISTOTLE (*q.v.*) in his views about value or money, except in so far as he recognises that deferment of payment and other such "accidents capable of being valued" may affect the price (§ 14)—a principle of importance among casuists in regard to the question of interest. Not all monopolies, he holds, are contrary to the law of nature: they may be permitted by a government for a just cause, as in the case of Joseph in Egypt. But a combination to raise prices or prevent by fraud or force the importation of a large quantity of a commodity is wrong (§ 16).

Contrary to the more received opinion, Grotius holds that usury is not forbidden by the law of nature, and points out the fallacies of the usual arguments about the barrenness of money, etc.; but since the divine law forbade Hebrew to lend to Hebrew money on usury, and "since precepts of this sort bind Christians also as being called to a higher pitch of virtue," and since what was a duty towards a fellow-countryman then is for Christians a duty towards all men, usury seems forbidden to Christians by the positive divine law (ii. 12, § 20). But for Grotius, as for the mediæval casuists, there are distinctions between the usury which is forbidden and a taking of interest which is

permissible. "Human laws," he says, "which allow something to be covenanted for the use of money, if the rate lie within a due compensation, are not opposed to natural or divine law,—as in Holland it has long been granted to persons in general to require 8 per cent per annum, and to merchants 12 per cent. If they exceed that standard, laws may afford impunity, but they cannot give a right" (*Ibid.* § 22).

[The *De Jure Belli et Pacis* has been edited by Whewell, with an English translation which omits some of the superfluous quotations. 3 vols., Cambr., 1853. The translation was also published separately. There is a careful analysis of the whole work in Hallam's *Introd. to the Literature of Europe*, vol. ii. The accounts of it in Janet's *Histoire de la Science Politique*, in Bluntschli's *Geschichte der neueren Staatswissenschaft*, and in Erdmann's *History of Philosophy* (translated) are much more meagre.—Art. "Grotius" in *Encycl. Brit.* by Mark Pattison.—See also many important references in Maine's *Ancient Law* and *International Law.*—Austin's *Jurisprudence.*—Hall's *International Law*, and in Dr. Bonar's chapter in his *Philosophy and Political Economy.*] D. G. R.

GROUND-ANNUAL (Scotland) a yearly revenue or perpetual annuity payable out of land. (1) In lands originally church lands the superiority or lordship is in many cases in the crown, the vassal holding by tenure direct of the crown at a nominal rent, but paying an annual sum or "ground-annual" to the crown grantee of the revenues of the church lands. (2) In modern practice the building-land speculator, for example, takes land on feu, and, where sub-infeudation is not prohibited at law or by agreement, he sublets to builders at an enhanced Feu-Duty (see FEU); but where sub-infeudation is prohibited, he dispones or grants the land to be held not of himself, but of the superior or overlord, subject to a reserved perpetual annual charge or "ground-annual," to be paid to himself his heirs and assignees. This reserved charge, which in its nature is similar to the chief rents frequently affecting freehold land in the North of England, is made a burden affecting the land itself; and usually the grantee executes a bond, in which he dispones the land back to the granter, but only as a security for the annual payment, for which he also becomes personally liable under the so-called "bond and disposition in security." The documents in the transaction are recorded in the land registers. A. D.

GROUND RENTS. The expression ground rent is generally used in connection with building leases. It is sometimes said or believed that the ground rent represents the yearly value of the ground as distinguished from the value of the building, but this is not necessarily the case. The lessor may prefer to let the land for a lump sum payable at once and to take no rent (a "peppercorn rent"), or a merely nominal annual sum, in which case the ground rent is of course much less than the yearly value of the land. On the other hand annual payments are called ground rents in many cases, in which case they really represent part of the annual value of the building. This arises more especially in the case of "improved ground rents." A builder, having taken a building lease at an annual rent of £10, and having built a house costing £2000, may deal with the property in a great variety of ways. He may assign the lease to an occupying tenant for a price exceeding £2000, the purchaser undertaking to pay the original ground rent; he may let the house on a short lease for a yearly rent representing the full yearly value, in which case the rent is called the rack rent; or he may, in consideration of a premium of £2000, grant an underlease for the whole term at an increased ground rent, the increase representing the profit on the transaction. In the last mentioned case the rent is called an "improved ground rent." In order to make the purchase look attractive he may charge a smaller premium than £2000, which will of course necessitate a further increase in the improved ground rent, but in such a case, which in practice occurs pretty frequently, the so-called ground rent partly represents the interest and sinking-fund for the cost of the building, and to that extent exceeds the annual value of the ground. It is sometimes said that ground rents do not pay local rates, but this is a fallacy. The rates are charged on the rack rents, that is to say on the full value, which, of course, includes the ground rent. No doubt the rates are, as a rule, paid by the occupying tenant, but this is generally a condition of the lease, and the tenant, knowing that he has to pay the rates, pays so much less rent (see FINANCE, GENERAL PRINCIPLES OF; TAXATION).

In the language of auctioneers and others the expression ground rents is frequently used to describe property let on building leases, but this is, of course, inaccurate. The expression "ground landlord" which is often used for the ultimate recipient of ground rents, is also misleading and connected with the popular idea that the lessor owns the land and the lessee the house. During the continuance of the lease the lessor has a merely reversionary interest in the land and the house, the lessee being, subject to the conditions of the lease, their temporary owner. The ownership of the house cannot in any sense be severed from the ownership of the land, and the benefit of an increase in the value of the land in the case of a long lease accrues to the lessee, and not to the lessor, at least not before the expiration of the lease. This fact is also frequently lost sight of when new schemes of taxation are discussed. German writers use the word *Grund-rente* in the sense of economical rent.

[Much interesting information on these subjects

can be found in Mr. C. H. Sargant's books, *Ground Rents and Building Leases*, and *Urban Rating*.—For a different view see B. Costelloe, *Incidence of Taxation* (1893).—*Rep. of Sel. Comm. H. of C. on Town Holdings.*] E. S.

GROWING CROPS, though not severed from the land, and therefore, strictly speaking, part of the land, are for some purposes looked upon as things not partaking of the nature of real property (see EMBLEMENTS). For the purpose of the Bills of Sale Act (see BILL OF SALE), growing crops, when separately assigned or charged, are deemed to be personal chattels; but when they are assigned or charged together with any interest in the land on which they grow, they are looked upon as part of the land, and the document embodying the assignment or charge need not be registered as a bill of sale. E. S.

GROWTH, PROPORTIONATE, may be defined as the increase of a quantity relative to its initial value. For instance the export of coal from England being 23·6 million tons in 1880 and 38·2 million in 1890, the proportionate growth of the export during the period 1880-90 is $(38{\cdot}2 - 23{\cdot}6) \div 23{\cdot}6 = \frac{14}{23}\frac{6}{6}$ or nearly 62 per cent. In general terms, if x_0 be the value of the quantity at the beginning of the period under consideration and x_1 at the end, the proportionate growth during that period is $(x_1 - x_0) \div x_0$. If in a second period the quantity changes from x_1 back to x_0, the proportionate growth downwards, or decrease, is by parity $-(x_1 - x_0) \div x_1$—not the mere negative of the growth upwards, as might seem natural. An attempt to obviate this anomaly is made by Mr. Cooley in "Observations on the Measure of Change" in the *Journal of the American Statistical Association* for March 1893. It may be observed that the difficulty disappears when the growth is *small*.

Proportionate growth may be considered as relative to, or dependent on, some variable other than *time*. Thus the proportionate growth of the demand for a commodity corresponding to a small proportional growth or percentage increment of its price is the measure of Elasticity of Demand (see DEMAND).

The conception of the proportional growth of a quantity being independent of the particular scale or unit employed in measuring the quantity, is particularly appropriate when we want to compare the increase of different things. The ordinary graphic representations of *absolute* growth are not so well suited for this purpose. Thus suppose that, to quote Prof. Marshall, "the consumption per head of tea and sugar in the United Kingdom for the years 1860 to 1883 is represented to the same scale in pounds" in two ordinary curves. "The danger of the popular use of statistical curves is illustrated by the fact that an orator might perhaps carry his audience with him, while he argued that they showed a much more rapid growth of the consumption of sugar than of tea. But, really, there is very little difference between the two as is seen on comparing 'two curves' in which a pound of sugar is compared against, not a pound, but an ounce of tea" (see GRAPHIC METHOD in connection with Fig. 4).

(Marshall, *Principles of Economics*, bk. iii. ch. iv. p. 160 *et seq.*—*Journal of the Statistical Society*, Jubilee vol. 1885, p. 257 *et seq.*)

R. H. H.

GUARANTEE. A contract by which one person—called the surety—undertakes to be liable for the debt of another person—called the principal debtor. A contract of this nature must, in accordance with § 4 of the Statute of Frauds, be in writing; but § 3 of the Mercantile Law Amendment Act provides that it shall not be necessary for the consideration to be set out in writing. This does not, of course, dispense with the necessity of a consideration in all cases where the contract is not made by deed, but the granting or continuing of a loan to the principal debtor is in itself a sufficient consideration to support the promise of the surety.

It is frequently doubtful whether a guarantee is intended to be a continuing one or whether it is merely intended to refer to a special transaction, and the surrounding circumstances may be considered in order to ascertain the intention of the parties (see, for instance, Leathley *v.* Spyer, L. R. 5 C. P. 595). A contract of guarantee must be distinguished from a contract of indemnity, which may be valid though not in writing. The distinction is shown in the well-known case of Birkmyr *v.* Darnell (1 Smith, Leading Cases, 8th ed., p. 326), and expressed in the following words: "If two come to a shop and one buys and the other, to gain him credit, promises the seller: *If he does not pay you, I will*, this is a collateral undertaking, and void without writing by the Statute of Frauds. But if he says: *Let him have the goods, I will be your paymaster*, or *I will see you paid*, this is an undertaking as for himself, and he shall be intended to be the very buyer, and the other to act as but his servant," but it is often very difficult to decide what was the intention of the parties as to these points (see *in re* Hoyle (1893), 1 Ch. 84).

A creditor who is secured by a guarantee must be careful not to alter the terms of his arrangement with the principal debtor without the concurrence of the surety, as a disregard of

this rule may have the effect of discharging the surety.

A surety, after having satisfied the creditor, is entitled to an assignment of all securities held by the creditor in respect of such debt, and to use all remedies of the creditor in order to obtain from the principal debtor or any co-surety repayment of the sums expended by him.

[De Colyar, *Law of Guarantees*, 3rd ed., 1897.]

E. S.

GUARANTYISM, a term introduced by WILLIAM ELDER (*q.v.*) to denote the various charitable, savings, and philanthropic agencies organised to promote thrift.

GUARD RENTS, CASTLE-GUARD RENTS. Castle-guard or castle-ward was a form of military service which seems to have been more common in the south and east of England than elsewhere. The tenants, who held lands in virtue of this service, did not follow their lord to war; their duty was the defence of his castle, where they were obliged to assemble on the approach of an enemy, and remain to assist the regular garrison till the danger was over. In later years this service was compounded for by an annual money payment called castle-guard rent. A long list of guard-rents, in connection with Dover Castle, dated 46 Henry III. is preserved in the *Red Book of the Exchequer*. There is a similar list at the public record office, dating from about 1680. This species of rent is not yet obsolete, for the Earl of Chichester, as owner of Hastings Castle, still receives guard-rents from tenants in the Rape of Hastings.

[C. I. Elton, *The Tenures of Kent*, London, 1867.—*Archæological Review*, i. 57, London, 1888.—*Red Book of the Exchequer*, folios 194 d. and 195.—*Public Record Office Calendars and Indexes*, No. 83.]

A. E. S.

GUARDIANS OF THE POOR. The title and office of guardian appear in Gilbert's Act of 1782 (22 Geo. III. c. 83). Where an incorporation of parishes was formed (see GILBERT'S ACT) the relief of the poor was to be administered by paid guardians, nominated by the justices of the peace, one to represent each of the incorporated parishes. The Poor Law Amendment Act (4 & 5 Will. IV. c. 76) combined parishes into unions for poor-law purposes, and gave the administration of the law to guardians of the poor. Guardians were of two kinds, (1) elected by the several parishes of a union, or by the several divisions of a parish. They were elected annually, or in an increasing number of cases triennially, by owners and occupiers under Sturges Bourne's Act, by which every £50 of rateable value gives a vote up to six; (2) *ex-officio* guardians, viz. justices of the peace for the particular county, riding, or division, who resided in the respective unions. There were in 1893, 20,687 elected and 7412 *ex-officio* guardians in England and Wales. The qualifications, election, and tenure of office have been greatly modified by the Local Government Act of 1894 (56 & 57 Vict. c. 73). Under this act *ex-officio* guardians are abolished. Henceforth every person who represents a parish as guardian will be chosen for three years by the parliamentary and county council electors. The qualification for a guardian is to be an elector or to have resided for twelve months. Sex and marriage are no disqualification. A chairman, vice-chairman, and two members, may be co-opted from persons qualified to be guardians. The duty of guardians is threefold: (1) to hear and decide applications for relief; (2) control the various establishments, workhouses, schools, etc.; (3) appoint and control the various officers. The office of guardian is unpaid and voluntary, but one of the most important in the whole range of local government. The effect of a good or bad administration of the poor law is immediately felt over a wide area, and the happiness or misery of thousands depends directly or indirectly upon the action of guardians. Further it is difficult to overstate the importance of the office as a political training.

[Glen, *Poor Law Orders*.—Aschrott, *English Poor Law*.—Nicholls, *History of the Poor Law*.]

L. R. P.

GUARINI, G. B. His claim to recognition lies in the fact that he translated, by direction of Eleanor of Aragon, Duchess of Ferrara, the celebrated work of CARAFA (written originally in Italian between 1469-1482), into Latin, *De regis et boni principis officio*. This translation was printed in 1668 (see Cossa, *Introduction to Political Economy*, translation, p. 158).

A. B.

GUÉRARD, BENJAMIN (1797-1854), a member of the French Institute, rendered invaluable services both to French and Western economic history of the Carolingian period by his able editions of the *Polyptyque* (1836-1844), or census of the Abbot Irminon of Saint Germain des Prés and of the *Polyptyque* of the abbey of Saint Remi in Rheims (1853), and also by his masterly preface (*Prolégomènes*) to the former. In this he explained the condition and status of persons and of land from the time of the invasions of the barbarians to the rise of communal institutions.

[See Dr. Seebohm on "French Peasant Proprietorship under the open field System of Husbandry" in the *Economic Journal*, vol. i. pp. 62-66.]

E. Ca.

GUERRY DE CHAMPNEUF, JACQUES (1788-1852), first a barrister at Poitiers, then public prosecutor, and about 1820 advocate-general of the *Cour Royale*, was in 1824 appointed director of criminal prosecutions and pardons in the ministry of justice, and in this capacity instituted in 1825 the first annual criminal statistics known under the name of *Compte Général de l'Administration de la Justice Criminelle en France*. He lost his post at the revolution of 1830 and returned to the bar;

but his delicate health and want of leisure never allowed him to publish the results of his juridical and economic studies. E. Ca.

GUICCIARDINI, Francesco (1482-1540), was born at Florence, and distinguished himself as an advocate, as a diplomatist, as a civil administrator under pope Leo X. and his two successors, and as lieutenant-general of the papal forces at the defence of Parma. In 1534 he retired to his native city, where he proved a friend to the Medici, and was at the head of the party which brought back Cosmo in 1537.

The fame of Guicciardini will, however, rest on his *History of Italy* from 1492 to 1532. This includes valuable information as to the great trading republics at an interesting epoch. The best edition is that of 1810 by Rosini. A. P. Goddard's translation, London, 1763, is from an incomplete text. R. H.

GUICCIARDINI, Luigi (1523-1589), nephew of Francesco Guicciardini, the famous historian. He spent a great part of his life in the Netherlands, where he was at first favoured, but afterwards imprisoned by the Duke of Alva.

Among other works, L. Guicciardini published in 1567 his *Descrizione di tutti i Paesi Bassi*, a detailed geographical and topographical account of the Netherlands, showing the condition, resources, and trade of the country. A third edition, revised by the author, was published at Antwerp (Plantin Press) in 1588. R. H.

GUILDER. See Florin (Dutch).

GUILDS. For all subjects under this heading—Craft Guilds, Frith Guilds, Merchant Guilds, Town Guilds, etc., see Gilds.

GUILDS, System in Spain. See Gilds, System in Spain.

GUILLARD, Achille (1799-1876), was born at Marsigny (Saone-et-Loire). He was an eminent statistician, and also much devoted to the study of natural science, particularly of botany. The most important economic work by Guillard is his valuable and laborious *Éléments de statistique humaine ou démographie comparée*, 8vo, 1855. A. C. f.

GUILLAUMIN, Urbain Gilbert (1801-1864), was born at Couleuvre near Moulins, and died at Paris. He was a very intelligent publisher, and in that capacity greatly contributed, through the influence of the many important works which were issued from his house, to extending the knowledge of political economy in France. As a young man he had to suffer much hardship. He came to Paris in 1819, and went into business. In politics he sided with the opposition, and went so far as to become a *Carbonaro* (see Carbonari). He was a friend of Béranger, and started at first as a political publisher; but becoming acquainted with Adolphe Blanqui, and with Joseph Garnier, he was led to turn his energy towards a speciality which won him great and well-deserved renown. Horace Say, son of Jean Baptiste Say, and father of M. Léon Say, aided him by his advice, and gave him also a pecuniary support which was a strong testimony to the character of both men. Guillaumin's two daughters, of whom the eldest, Félicité, died in 1885 at the age of fifty-six, inherited both his administrative ability and his devotion to economic science. The following are the best known publications of this house:

Dictionnaire du commerce et des marchandises, 1835.—*Dictionnaire de l'économie politique*, 1852.—*Dictionnaire du commerce et de la navigation.*—*Journal des économistes* (monthly), since 1842.—*Annuaire de l'économie politique et de la statistique* (yearly), since 1844.—*Collection des principaux économistes*, 16 vol. large 8vo, 1842.—*Économistes et publicistes contemporains*, 93 vols. 8vo.—*Bibliothèque des sciences morales et politiques*, 64 vols. 18mo, etc. A. C. f.

GUINEA, Introduction and Rating of. Soon after his accession, Charles II. issued a proclamation dated 26th August 1661, under which the older Unites of James I.—that is to say, those issued prior to 1619, and valued at 22s. (1 lb. troy = £40 : 18 : 4)—were to pass current at 23s. 6d.; and all unites of subsequent dates, which up to this period passed at 20s., were to be valued at 21s. 4d.

The legal weights of these coins and their fine gold contents were as follows:—

Unite or Laurel (Value of), 1604-1661.

Name.	Number of pieces in the lb. troy.	Value of lb. troy by tale.	Legal weight in grains.	Fine gold content in grains.
		£ s. d.		
Unite of 1604, rated at 20s. till 1612 .	37¼	37 4 0	154$\frac{28}{31}$	141$\frac{3}{31}$
Unite of 1604, rated at 22s. from 1612 to 1619 . . .	37$\frac{13}{20}$	40 18 4	154$\frac{11}{31}$	141$\frac{1}{31}$
I. Unite or Laurel of 1619, rated at 20s. till 1661 . .	40$\frac{1}{10}$	40 18 4	140$\frac{28}{31}$	129$\frac{4}{31}$
II. Another Unite or Laurel of 1619 rated at 20s. till 1661 .	41	41 0 0	140$\frac{20}{31}$	128$\frac{27}{31}$

As the standard weight and fineness of these coins were not modified during the reign of Charles I., or during the Commonwealth, it will be seen that the principal coins of crown gold, containing 22 carats gold and 2 carats alloy, were as shown in this table when the proclamation of 1661 above referred to was issued.

When in 1663 steps were taken to amend the coinage by adopting more modern methods of manufacture, new gold coins were ordered to be struck having current values of 100s., 40s., 20s., and 10s. These twenty-shilling pieces were for the most part struck from gold obtained in Guinea and imported by the African Company, from which circumstance they derived their name, and they bore the device of a

"little elephant," the stamp of that company. It is hardly necessary to state that gold pieces of the value of 20s. had long been used, having been first struck by Henry VII. in 1489; but from the accession of Charles II. the guinea at once took its place as the principal gold coin in this country, a position which it maintained until the great currency reform of 1816.

The weight of the "guinea" being based on that of the second unite of 1619, with a currency value of 21s. 4d., it follows that, as the pound troy produced forty-one of these latter pieces, each twenty-shilling piece weighed 131$\frac{4}{11}$ grains, and the pound of gold was valued at £43 : 14 : 8. In 1670, a fresh indenture directed that the pound should be coined into £44 : 10s.—that is to say, that the weight of each "guinea" should be 129$\frac{1}{8}\frac{1}{8}$th grains, which is identical with the weight of gold of the old standard (994·8) which passed current for 20s., under the indenture made by Charles I. in 1626. Although variations were frequently made in the official rating of the guinea, it may be noted that, in the hundred and fifty years during which it continued to be the principal gold coin of this country, no further change was made in regard either to its weight or its fineness.

During the twenty-five years from 1670 to 1695 the silver currency was gradually reduced, by clipping and other forms of fraud, to such an unsatisfactory state that, although no legal change had been made in the valuation of the guinea, it was impossible for its equivalence to twenty shillings in silver to be maintained; and in the latter year, in consequence of a memorial received from merchants and others, which showed that the guinea commonly passed for 30s., the House of Commons resolved, on the 15th February 1695, that this coin should not pass above a rating of 28s. Within a fortnight—that is to say, on the 28th February—an act was passed by which the rating was further reduced to 26s. from and after the 25th March 1696; and by a later act of the same session it was directed that from the 10th April 1696 the rating should not exceed 22s. The recoinage of silver, which was now being seriously taken in hand, greatly aided the steps taken to regulate the currency of the guinea; and towards the latter end of 1698, the silver recoinage being then well advanced, a report was presented to the House of Commons by LOCKE and others pointing out that, by fixing its value at 22s., gold was overvalued in this country as compared with Holland, and recommending that the rate should be reduced to 21s. 6d. The House resolved, therefore, "that, under the Act 7 and 8 William III. c. 19, no person is obliged to take guineas at twenty-two shillings apiece," and they were generally received at the lower rate of 21s. 6d. The value thus determined upon was maintained for several years, and, although Sir Isaac NEWTON, in a report to the Lord High Treasurer in 1711-12, pointed out that "gold is over-valued in England in proportion to silver by at least 9d. or 10d. in a guinea," no action was taken with a view to revise the rating until the 12th August, 1717, when Sir Isaac Newton was directed by the Lords Commissioners of His Majesty's Revenue to lay before them "a state of the gold and silver coin of this Kingdom in weight and fineness, and the value of gold in proportion to silver," etc. In the classic report which he prepared, dated 21st September, 1717, he showed that the intrinsic value of the guinea, as deduced from the ratio of silver to gold in all the principal trading nations of Europe, was about 20s. 8d., so that the legal rating was 10d. in excess of the value of the coin. This over-valuation naturally led to large quantities of the silver currency being withdrawn from circulation; and the inconveniences thus occasioned were set forth in an address from the House of Commons to the King, who issued a royal proclamation on the 22nd December 1717, forbidding all persons "to utter or receive any of the pieces of gold coin of this kingdom commonly called guineas at any greater or higher rate or value than one and twenty shillings for each guinea." The valuation thus fixed was maintained unaltered throughout the century which elapsed before gold was made the sole standard of value in 1816; and it was on this basis that the weight of the present principal gold coin, the sovereign, introduced in the following year, was determined. E. R.

GUINEA TRADE. Englishmen are first known to have traded with Guinea in 1530, for ivory, and not many years later for gold, though the gold from which guineas were coined was first imported by the Royal African Company formed in 1672 (see AFRICAN COMPANIES, EARLY). English trade in negroes began in 1562; they were carried to Hispaniola, and there exchanged for goods for the English market; and ten years later the right of England to share in the Guinea trade was acknowledged by the Portuguese, who frequently hired our ships to carry their slaves to Brazil. It was not until 1662 that the direct English trade in negroes for the supply of the American plantations began. Besides slaves, its staple product, Guinea supplied the merchants with ivory, gum arabic, gum senegal, camwood and other woods, bees' wax, cotton, ostrich feathers, ginger, pepper, rice, and palm oil, in exchange for gunpowder, arms and ammunition, lead and iron goods, brass, copper, tobacco, salt, cocoa, woollen, cotton, and linen goods, bugles, and Bengal goods. In most of these articles trade still continues (see AFRICAN COMPANIES, EARLY).

[Macpherson, *Annals of Commerce.—Gazetteer of the World*, art. "Guinea."—Reclus, *Nouvelle Géographie Universelle*, 1887, tom. 12.—Horton, *The Silver Pound*, 1887.] E. G. P.

HABIT. The economic influence of habit is defined by Prof. H. Sidgwick (*Principles of Pol. Econ.*, bk. ii. ch. xii.), as "the tendency to do as one has done before.' This, while it continually presents obstacles "to the adoption of economic improvement," yet on the other hand "has its counterpart in the tendency to expect to be treated as one has hitherto been treated." . . . "Some claims generated in this way have legal validity; as when a right of way is established without express permission of the landowner."

For the economic effect of the tendency to do as others do, see CUSTOM.

HAGEN, KARL HEINRICH (1785-1856), son of a professor of medicine, was born at Königsberg. After studying political science under HOFFMANN, he entered the government service, and in 1811 became professor of political science and political economy (*Staatswissenschaften und Gewerbekunde*) at Königsberg, which appointment he retained till 1849, when he sank into a lingering illness.

Hagen's principal work appears to be the one entitled *Von der Staatslehre und von der Vorbereitung zum Dienste in der Staatsverwaltung*, 1839. Of the seven sections into which this work is divided, the second, fifth, and sixth, entitled respectively Sketch of the Science of Political Economy, the Theory of Finance, and the Study of the Functions of Government (*Cameralwissenschaften*), may be recommended to the economist. The first-mentioned of these has been translated by PRINCE-SMITH, under the title of a *System of Political Economy* (1844). It is enriched with notes derived from Hagen's other writings and from his lectures, and by additions to the text which the author himself contributed. It is divided into several inquiries, of which the third, relating to value, seems the most interesting. From one of the notes to this part (p. 28), it appears that Hagen had made some advance towards the construction of what would now be called a "demand schedule" (Marshall) or DEMAND-CURVE. But the particular formulæ proposed by Hagen are fanciful.

The general conception was employed by him in an interesting attempt to prove the expediency of free trade by mathematical reasoning: *Die Nothwendigkeit der Handelsfreiheit für das Naturaleinkommen mathematisch nachgewiesen*, 1844. The argument appears to be vitiated by not including wages, as well as profits, in the measure of the advantage to the community. It may be worth alluding to the demonstration that, on the assumptions made, a slight degree of protection might produce a slight advantage, which turns into a disadvantage as the tariff is increased. Considerable interest attaches to the criticism of COURNOT'S theories of international trade, in a note at the end of the brochure, to which Cournot replies in his *Principes* of 1863. Hagen seems to fall short of Cournot with respect to the assumption above indicated; but to have the advantage in another respect. In estimating the change in the national revenue due to a new import (and *mutatis mutandis* a new export) Hagen takes account of the circumstance that the native labour displaced by the importation is apt to be employed in some other industry. He also professes to take account of the advantage which consumers of the imported commodity derive from a fall in its price. But, like Cournot, he misses the proper conception of CONSUMERS' RENT.

Besides the two works mentioned, Hagen is also the author of some articles in *Beiträge zur Kunde Preussens*, 1803-24; and of the following works: *On Platina Coin* (mentioned without date in the note to the *System of Political Economy* above referred to).—*Observationes œconomico-politicæ in Æschinis dialogum qui Eryxias inscribitur*, 1822.—*Ueber Einrichtung des Creditvereins von Gutsbesitzern im Königreich Bayern*, 1825.—*Aufklärung ueber das Sinken des Werthes des Geldes; aus dem Englischen*, 1839. Of these writings none except the first-named and the works referred to in the text have come under the eye of the present writer. [*Allgemeine Deutsche Biographie.* — Article by Prof. Edgeworth on "International Values," *Economic Journal*, vol. iv. p. 629.] F. Y. E.

HAIA. See FORESTS, MEDIÆVAL.

HAINES, RICHARD (17th century), is said to have been a Sussex gentleman (*Bread for the Poor*, by Philo-Anglicus, 1678, p. 4); he was evidently a royalist in his opinions, and speaks in one place (end of *England's Weal and Prosperity*) as if he were a member of parliament, but his name does not appear in the lists in Cobbett's *Parliamentary History*.

Haines wrote the following pamphlets, all very similar, to advocate his favourite remedies for social and economic evils:

The Prevention of Poverty, or a Discourse of the causes of the Decay of Trade, etc., 1674.—*Proposals for building in every County a Working-Alms-House or Hospital*, 1677 (reprinted in the *Harlean Miscellany*, 1810, vol. viii.)—*New Lords, New Laws, or a discovery of a grand usurpation*, etc., 1674. (Matthew Caffin replied to this pamphlet, *Envy's Bitterness corrected with the Rod of Shame*), 1674.—*Provision for the Poor*, etc., 1678.—*A Model of Government for the Good of the Poor and Wealth of the Nation*, 1678.—*A Method of the Government for such Public Working-Alms-Houses as may be erected in every County for bringing all Idle Hands to Industry*, 1679.—*A Breviat of some Proposals prepared to be offered to the Great Wisdom of the Nation*, 1679.—*England's Weal and prosperity Proposed*, 1681.

His sovereign remedy for decrease of exports and increase of imports, for mendicancy and pauperism, was the erection of great factories,

locally governed and established by rates, where the unemployed poor, whom he computed at 200,000, and even criminals, might be set to make linen or woollen cloth, for wages low enough to enable England to undersell foreign goods. The plan is not very carefully thought out; many of the difficulties which would arise being wholly overlooked. In the second pamphlet he mentions, without explanation, his invention of a plan by which "one man may turn fifty spinning wheels which shall serve a hundred persons to spin with at once; so that the spinners shall have nothing to do but employ both hands to draw tire from the distaff"; and also of "an engine by which fifty men may, without striking a stroke, beat as much hemp in one day as a hundred shall do in two days." E. G. P.

HALE, Sir Matthew (1609-1676), a native of Alderley in Gloucestershire, entered at Lincoln's Inn in 1629, and practised successfully at the bar. Though decidedly royalist in views he took no active part in politics, even during the civil war, and accepted a judgeship from Cromwell in 1653. He represented Gloucestershire in the parliament of 1654, Oxford university in that of 1658, and Gloucestershire again in the convention parliament which restored Charles II. in 1660. The same year he was made lord chief baron, and was knighted, and in 1671 he became lord chief justice. Ill-health induced him to resign this post early in 1676, and he died at the end of the year.

In addition to several legal and scientific and many religious works, Hale wrote *Primitive Origination of Mankind*, 1677, some chapters of which have been published separately as an *Essay on Population*, 1782, but are not very valuable; *De Successionibus apud Anglos; The law of Hereditary Descents;* and *Touching Provision for the Poor*, printed in 1683. In this he summed up existing laws, pointed out their defects, and suggested remedies. As the only radical cure for mendicancy and poverty he proposed the establishment of workhouses, for which purpose parishes should be grouped in unions; after their erection by means of the rates they were to become self-supporting — places of industrial education for children and of employment for the poor, especially when other work was scarce.

[*Life and death of Sir Matthew Hale*, by Bishop Burnet, 1682.—Wood's *Athenæ Oxonienses*, 1817, vol. iii.—*Memoirs of the Life, Character, and Writings of Sir Matthew Hale*, by J. B. Williams, 1835.—*Dict. of National Biography* (this gives some of the dates one year later than the other accounts). Campbell, in *Lives of Chief Justices*, dwells at length on Hale's political position.]

E. G. P.

HALE, Nathan, LL.D. (1784-1863), was born in Westhampton, Mass., graduated at Williams College in 1804, and became a journalist and the editor of the Boston *Advertiser* in 1814. He was among the first to encourage the construction of railways in New England. He wrote *Remarks on the Banks and Currency of the New England States, in which an Attempt is made to show the Public Benefits resulting from the System pursued by the Allied Banks of Boston*, Boston, 1826, pp. 40, in commendation of the Suffolk bank system. This was a system devised for the more prompt redemption of state bank bills—bills which were often depreciated in value, and regarded with suspicion in localities other than the place of issue. This practice was introduced to a limited extent in Boston in 1813, but not fully developed until 1825. The work of assorting and returning the notes to the place of issue was finally undertaken by the Suffolk bank of Boston, from which this policy took its name. It was confined, however, to New England banks, but aided much in giving a sounder banking administration.

He also wrote *The American System; or the Effects of High Duties on Imports designed for the encouragement of Domestic Industry*, Boston, 1828, pp. 56. He objected to extending the American system of high duties, and questioned the expediency of a warehousing system. It is a strong argument, and is said to have done much to bring about the compromise tariff of 1833. D. R. D.

HALES, John (16th century), was connected with the well-known Kentish family. He does not appear to have been at any university, but he was a man of wide and varied learning, and founded the grammar school at Coventry. He was clerk of the hanaper in the time of Edward VI. and sat for a time in parliament as member for Preston. The chief economic interest connected with him is due to the active part he took in the commission on enclosures in 1548. His elaborate defence of himself and some other papers have been recently printed in full (*Discourse of Common Weal*, Introduction), and amplify the information in the extracts given by Strype.

Recently good reason has been shown for attributing to Hales the well-known *Examination of Complaints* of which W. S. claimed to be the author. Miss Lamond has shown that during his life he was regarded by some people as its author, and has adduced strong reasons from internal evidence in support of this view. Since she published her essay (*English Historical Review*, April 1891), it has received general acceptance. The full evidence, with many biographical details, will be found in her edition of the dialogue published in 1893 under the title *A Discourse of the Common Weal of thys Realm of England*.

If this view be correct it at once appears that Hales was, as an economist, much ahead of contemporary opinion. His views on the evils of a debased currency, on the balance of trade, on exclusive corporations, and on other subjects are extremely interesting. Hales may well get the credit of having expressed them well and clearly, though there seems to be some reason to believe that he had not thought out these opinions for

himself, but was chiefly the mouthpiece of Hugh Latimer (see LATIMER). On the economics of the dialogue, compare the review of the discourse in the *Economic Journal*, December 1893. W. C.

The value of the current half-sovereign in gold francs, 900 fine, is 12·61 fr. (see POUND STERLING). F. E. A.

HALIFAX, CHARLES MONTAGUE, Earl of (1661-1715), the distinguished statesman and financier, was educated at Westminster School, and at Trinity College, Cambridge, where he formed a lifelong friendship with Sir Isaac Newton. Entering upon a political career, he signed the invitation to the Prince of Orange, was returned to parliament for Malden, and sat in the convention. Quickly developing a remarkable talent for financial business, he was made, in 1691, one of the commissioners of the treasury, and called to the privy council. In December 1692 he proposed, in the House of Commons, to raise a million sterling by way of a loan. William III. required money for his wars; the moneyed classes desired sounder investments than bubble companies; the landed proprietors were hard pressed by the weight of taxation, and some new financial expedient was necessary. Montague's loan bill was consequently accepted, and it passed both Houses without opposition. Thus was laid the foundation of the national debt. "By this memorable law," says Macaulay (*History of England*), "new duties were imposed on beer and other liquors. These duties were to be kept in the exchequer separate from all other receipts, and were to form a fund on the credit of which a million was to be raised by life annuities. As the annuitants dropped off, their annuities were to be divided among the survivors, till the number of survivors was reduced to seven. After that time, whatever fell in was to go to the public. It was therefore certain that the 18th century would be far advanced before the debt would be finally extinguished; and, in fact, long after King George the Third was on the throne, a few aged men were receiving large incomes from the state in return for a little money which had been advanced to King William on their account when they were children. The rate of interest was to be 10 per cent till the year 1700, and after that year 7 per cent."

By the spring of 1694 it became again absolutely necessary to find some new mode of defraying the war charges. Three years before, William Paterson, an ingenious Scotsman, had propounded a plan for a national bank. The scheme was favourably regarded, but nothing was done. Montague, however, now furthered the plan, and engaged to carry it through the House of Commons, while Michael GODFREY, an upright and opulent merchant, agreed to manage the city. An approving vote was obtained from the committee of ways and means, and Montague introduced a bill whose title gave rise to much comment and sarcasm. "It was indeed not easy to guess that a bill, which purported only to impose a new duty on tonnage for the benefit of such persons as should advance money towards carrying on the war, was really a bill creating the greatest commercial institution that the world had ever seen. The plan was that £1,200,000 should be borrowed by the government on what was then considered as the moderate interest of 8 per cent. In order to induce capitalists to advance the money promptly on terms so favourable to the public, the subscribers were to be incorporated by the name of the Governor and Company of the Bank of England. The corporation was to have no exclusive privilege, and was to be restricted from trading in anything but bills of exchange, bullion, and forfeited pledges" (Macaulay's *England*). In order, however, that the bank should not have the power over the national purse, a clause was inserted in the

act which inhibited the bank from advancing money to the crown without the authority of parliament. So popular was the scheme that the whole sum which the new corporation was bound to lend to the state was paid into the exchequer before the first instalment was due, and the Bank of England was successfully launched upon its career.

Montague was now such an acknowledged master of finance that in 1694 he was appointed chancellor of the exchequer. In the ensuing year he carried out his plan for re-coining the money of the kingdom. The new currency was to be of the old standard both in weight and fineness; all the new pieces were to be milled; the loss on the clipped pieces was to be borne by the public; a time was fixed after which no clipped money was to pass, except in payments to the Government; and a still later time was fixed after which no clipped money was to pass at all. The scheme was carried; Newton was appointed warden of the mint: and to meet the loss on the coinage a tax on windows was imposed instead of that obnoxious impost the Hearth-money. In 1696, however, the general distress and monetary confusion throughout the country were such that Montague introduced the system of Exchequer Bills (*q.v.*). He had already succeeded in engrafting on Harley's Land Bank Bill a clause which empowered the government to issue negotiable paper, bearing interest at the rate of threepence per day on one hundred pounds. Accordingly, exchequer bills drawn for various amounts from a hundred pounds down to five pounds, were now issued, and rapidly distributed over the kingdom. Montague also projected the scheme for a general fund, which gave rise to the sinking fund, afterwards established by Sir Robert Walpole. He further devised a method to raise the sinking credit of the Bank of England by a second subscription, and his general mortgage plan was warmly welcomed. The authority which the chancellor of the exchequer now wielded in financial matters was unprecedented, and he was publicly thanked by the House of Commons. In 1697 he became premier, but, owing to his vanity and arrogance, his popularity began to wane, and he was obliged to accept the auditorship of the exchequer, and to withdraw from the House of Commons with the title of Baron Halifax. In 1698 he founded a new East India Company, in the interests of greater freedom of trade, and to diminish the power and monopoly of the old company, but both institutions were eventually consolidated in 1708, under the title of "The United Company of Merchants of England trading to the East Indies." The Commons impeached Lord Halifax for breach of trust in 1701, and again in 1703, but the Lords threw out the articles. In 1706 Halifax took a leading part in negotiating the union with Scotland. On the death of Queen Anne he was appointed one of the council of regency, and when George I. took possession of the throne he was created Earl of Halifax, and became first commissioner. Disappointed at not becoming lord high treasurer, he intrigued with the tory leaders, but his schemes and his life ended suddenly on the 19th May 1715.

HALL, Charles, M.D. (1745?-1825?) author of *The Effects of Civilisation in European States*, London, 1805, republished in J. M. Morgan's Phœnix Library, 1850. After a general view of the ills of society, which anticipates Henry George and the later socialists, wherein landed property is stated to be "the basis, source, and substance of all wealth," into which "all must be resolved," it is curious to find the remedies advocated are the abolition of primogeniture and the repression or at least the severe taxation, of "refined manufactures." Hall afterwards, however, suggests a form of state ownership of the land, coupled with individual ownership of the produce. In Morgan's *Hampden in the 19th Century*, London, 1850, Hall is mentioned as having died in the Fleet prison at eighty. "His conversation was particularly animated and intelligent." Hall states that his experience as a doctor led him to consider the sufferings of the poor. He writes from Tavistock. Much stress is laid on the importance of Hall's book, as anticipating the later socialists, by Anton Menger, who, in his *Recht auf den vollen Arbeitsertrag*, 2nd ed., 1891, devotes a section, pp. 57-60, to an analysis of its arguments.

[*Dictionary of National Biography*, vol. xxiv. p. 60.]

HALL, VAN. See Van Hall.

HALL-MARKING. Hall-marks are impressions made at a public assay office upon gold and silver wares to indicate the fineness of the metal of which they are composed.

Hall-marking was first introduced in the year 1300, when, at the instigation of the English Gild of Gold and Silver Smiths, the system was enforced by Royal Command, and by the provisions of Stat. 3, cap. 30, of Ed. I. it was necessary to impress upon each piece of plate assayed the effigy of a leopard or a lion's head crowned. This was called the *king's mark*. A second mark, known as the *maker's mark*, was added in 1363 (37 Ed. III., cap. 7); and subsequently a third was introduced called the *assayer's mark* or *year letter*, consisting of a letter of an alphabet used for each year; when one type of letter was exhausted another was adopted. This system of indicating the date is still in use.

The marks used in England in recent times are five in number.

1. The *maker's mark*, the initials of the maker's name.

2. The *standard mark*, or mark to indicate the fineness of the metal.

For gold wares this is as follows :—

For gold 22 carats fine—22 surmounted by a crown.
„ 18 „ 18 „ „
„ 15 „ 15 and ·625.
„ 12 „ 12 and ·5.
„ 9 „ 9 and ·375.

For silver wares as follows :—

For silver 11 oz. 2 dwt. fine, 18 „ alloy } or 925 fine—a lion passant.
„ 11 oz. 10 „ fine, 10 „ alloy } or 958·3 fine—Britannia.

3. The mark of the *assay office*.

For London—a leopard's head.
„ Birmingham—an anchor.
„ Sheffield—a crown.
„ Chester—a dagger and three wheat sheaves.
„ Exeter—a castle with three towers.
„ Newcastle—three castles.
„ Edinburgh—a castle.
„ Glasgow—a tree, a fish, and a bell.
„ Dublin—Hibernia.

4. The *year letter* or date mark (described above).

5. The *duty mark*, the head of the reigning sovereign. This mark, which was introduced in 1784, and was continued till the early part of Queen Victoria's reign, is not now used.

Report of Select Committee on Hall-marking with proceedings, evidence, and appendix of acts, etc., 1878 (House of Commons, 328). F. E. A.

HALLER, KARL LUDWIG VON (1768-1854), born in Bern, entered the State Office (*Staats Kanzlei*) of the republic of Bern at the early age of sixteen, and was wont to congratulate himself on having never attended the lectures of a university, "as he was thus obliged to think for himself." He was sent as secretary on several foreign missions, and after the occupation of Bern by the French republican armies, was admitted into the Austrian civil service. Appointed professor of law in the academy of Bern in 1806, and member of the sovereign council in 1814, he was compelled to resign his professorship in 1817, when he became a Roman Catholic; up to the year 1830 he chiefly lived in Paris, writing in legitimist papers and living amongst the reactionary society of the French metropolis. After the revolution of 1830, he returned to Switzerland and resided in Soleure, where he died in 1854.

In 1808 he published his *Handbuch der allgemeinen Staatenkunde* which may be considered as the kernel of his large work: *Restauration der Staatswissenschaft oder Theorie des natürlich-geselligen Zustands der Chimäre des künstlich-bürgerlichen entgegengesetzt* (Winterthur, 6 vols., 1820) of which he himself wrote an (incomplete) French translation under the title of *Restauration de la Science Politique ou Théorie de l'État social naturel opposé à la fiction d'un État civil factice* (Lyons, 3 vols., 1830) in which he shows himself a warm admirer of the Middle Ages and an uncompromising opponent of the theory of the social contract and of constitutional government. The heading of the 13th chapter of vol. i. strikes the keynote of his doctrine: *Natürliche Ueberlegenheit ist der Grund aller Herrschaft, Bedürfniss der Grund aller Abhängigkeit und Dienstbarkeit* (Natural Superiority is the Basis of all Sovereignty, Want the Basis of every State of Dependence and Subjection). The domination of the strongest is for him the universal law of nature. He is essentially a writer on political subjects; but he deals in vol. ii. with economic questions, still always in the light of his mediæval leanings. Ownership in land (ii. pp. 36-60)' is a natural institution. The prince ought to live on his private income; if taxes are needed, they ought to be demanded, but always freely granted. The property and disposal of the proceeds of taxation belong to the prince, if not otherwise specified at the time they were granted. Taxes may be infinitely varied; a perfect proportional equality is impossible to reach. All have their faults; the best are those which come nearest to voluntary contributions (pp. 272-354); the foundation of charitable, scientific, and literary institutions is the outcome of moral duty; it has no compulsory and imperative character. It is dangerous to make them completely the prince's affair; they are often best provided for by private individuals or associations (pp. 359-366).

[For a critical account of Haller, see Mohl, *Geschichte und Litteratur der Staatswissenschaften*, ii. pp. 529-560 and *Zeitschrift für Staatswissenschaft*, Tübingen, 1870, vol. xxvi. pp. 93-105; as also Roscher, *Gesch. der Nat. Oek.*, pp. 779-788.] E. Ca.

HALLEY, EDMUND, LL.D., F.R.S. (1656-1742), the well-known astronomer, author of numerous astronomical and mathematical works, was the inventor of life tables of mortality. He was elected a fellow of the Royal Society in 1678, and became its secretary in 1713; was appointed Savilian professor of geometry at Oxford in 1703, and astronomer-royal in 1721. He was the friend of Sir Isaac Newton, in the publication of whose *Principia* he took an important part.

Halley's *Tables of Mortality from Observations made at Breslau*, read before the Royal Society in 1692, and published in the same year in the *Phil. Trans.*, No. 196, though they passed unnoticed at the time, except perhaps in Germany, served as a pattern for future calculators. They have been reprinted in vol. xviii. of the *Assurance Magazine*. "They show the annual movement of a population, the probability of survivorship, the average duration of one or more lives and the money values depending thereon" (*Assurance Magazine*, vol. vi. p. 138). [Walford, *Insurance Cyclopædia.—Dict. of National Biography.*—Graetzer, *E. Halley und Caspar Neumann*, 1883.—Lalande, *Préface Historique aux Tables de Halley*, 1759.—Delisle's *Lettres sur les Tables de Halley*, 1749.—R. Boeckh *Halley als Statistiker*, 1893.] E. G. P.

HAMBURG, BANK OF. See BANKS.

HAMILTON, ALEXANDER (1757-1804), was born in Nevis, West Indies. At the age of fifteen he was sent to New York to be educated. He sided with the colonists in the dispute with the mother country, which was rapidly approaching a crisis, and soon by his activity and vigorous writing attracted the attention of the older leaders. Hamilton was entrusted with responsible positions, and from 1776 to 1781 served as aide-de-camp on Washington's staff. Although occupied with military and political duties, he found time at this period to read widely in history, political economy, and finance. His notebooks and letters display a wonderful comprehension of financial problems, generally to be obtained only by actual experience. In 1781 he entered upon the study of the law, and was appointed continental receiver of taxes for New York. During 1782-1783 he was member of Congress, and wrote a *Report on the Import Duty*, 16th Dec. 1782, works, ed. 1851, vol. ii. 213-223. Hamilton recognised the weakness of the existing form of government, and laboured earnestly to secure the establishment of a strongly centralised government, through the convention of 1787. To secure the adoption of the constitution he co-operated with Madison and Jay in writing the *Federalist*. Upon the establishment of the present form of government in 1789, he was selected, at the age of thirty-two, by President Washington, to take charge of and organise as secretary the treasury department. Rarely has any financier had so many difficult problems presented to him to be solved in so brief a period. Among his many reports the five following are most important: Public Credit, 9th Jan. 1790; National Bank, 13th Dec. 1790; Establishment of a Mint, 28th Jan. 1791; Encouragement and Protection of Manufactures, 5th Dec., 1791; and Public Credit 16th Jan., 1795. These are found in J. C. Hamilton's ed., New York, 1851, vol. iii.; H. C. Lodge's ed., New York, 1885, vol. ii. Finance and Taxation; vol. iii. Finance, Taxation, and Commercial Relations; and in *American State Papers*, vol. i. The first four were issued in a period of less than two years. Besides these reports, Hamilton wrote many others, to be found in the above volumes. All of Hamilton's writings relate to concrete and practical questions of government policy. His state papers are regarded as the ablest issued from the treasury department, showing a remarkable genius in the treatment of finance. As he left, however, no systematic treatise from which his final conclusions may be judged, there has grown up since Hamilton's time a considerable divergence of opinion concerning his real views as to political economy. He differed from R. Morris as to the adoption of a money unit of account for the new coinage, favouring the dollar instead of the pound or any proportionate part. Although he preferred gold to silver, as more stable, yet, under existing circumstances, he did not regard it wise to contract the quantity of circulating medium, and consequently favoured bi-metallism. In advising the current ratio of one to fifteen, he did not perceive the influence then at work to lower the value of gold, and consequently underestimated silver. He advised a moderate seignorage. He was convinced of the advantages of a "full circulation," and offered this as one of the reasons for the establishment of a national bank. The active capital would be augmented through the operation of credit. This advantage also strengthened his conclusions as to funding the debt. Stock would pass current as specie. Although he favoured bank notes, he opposed treasury notes; his condemnation of the latter was in words often quoted: "The wisdom of the government will be shown in never trusting itself with the use of so seductive and dangerous an experiment. In times of tranquillity it might have no ill consequence, it might even perhaps be managed in a way productive of good, but in great and trying emergencies there is almost a moral certainty of its becoming mischievous. If it should not even be carried so far as to be rendered an absolute bubble, it would at least be likely to be extended to a degree which would occasion an inflated and artificial state of things incompatible with the regular and prosperous course of the political economy." In advising protective tariff duties, Hamilton argued largely from political considerations. He saw the necessity of immediately strengthening the general government. His economic arguments are as follows: Manufacturing establishments not only occasion a positive augmentation of the produce and revenue of the society, but they contribute essentially to render them greater than they could possibly be without such establishments. This follows because it occasions and affords opportunity for the division of labour, an extensive use of machinery, employment to classes, such as women and children, not generally employed, emigration from foreign countries, greater scope for diversity of talents, and securing a more steady demand for the surplus produce of the soil. Hamilton does not state definitely that these considerations should be controlling factors if it were possible to procure from abroad, on good terms, all the fabrics which it may need. He found nowhere a perfect liberty to industry and commerce—expediency, therefore, must be the principle of action for the United States. He did not believe that industry, if left to itself, would flow in the most profitable channel, for custom was a powerful influence. Hamilton was an active federalist, and, in the cabinet, opposed the influence of Jefferson. He resigned 31st

January 1795, and returned to the practice of the law in New York. He still remained an adviser of President Washington, and frequently engaged in political discussions. For two years he held the position of Inspector-General of the army. In 1804 he engaged in a bitter political controversy with Burr, who challenged him, and Hamilton was mortally wounded in the duel fought 11th July 1804.

[For Hamilton's financial administration, see his *Works* referred to, also *Life of Alexander Hamilton* by John T. Morse, jun., Boston, 1876, vol. i. ch. viii.-xi.—*Alexander Hamilton*, by Henry Cabot Lodge, Boston, 1882, ch. v.—For complete bibliography, see *Bibliotheca Hamiltoniana*, by P. L. Ford, New York, 1886.] D. R. D.

HAMILTON, Robert, LL.D. (1743-1829). He studied at Edinburgh, making unusual progress in mathematics under Matthew Stewart, but, though desirous of a literary career, was obliged to enter a bank in order to obtain a knowledge of business, and afterwards to take charge of a paper-mill. In 1769, however, he became rector of the academy at Perth, and in 1779 professor of natural philosophy in Marischal College, Aberdeen. By a private arrangement he taught the mathematical classes instead of his own, and in 1817 obtained the chair of mathematics, which he held until his death.

Besides some mathematical text-books Hamilton wrote an *Introduction to Merchandise*, 1777; three essays on *Peace and War*, 1790, *Government*, and the *Management of the Poor*, 1822; which show enlightened views on economic subjects, *e.g.* bounties, taxes on necessaries, and poor-relief, but a somewhat limited grasp of political matters; and an *Inquiry concerning the Rise and Progress, the Redemption and present State, and the Management of the National Debt of Great Britain and Ireland*, 1813, on which his fame chiefly rests. He was the first not to discover, but successfully to expose, the fallacy underlying Pitt's sinking fund; he proved that "the excess of revenue above expenditure is the only real sinking fund by which public debt can be discharged," and he showed that the existing system was not merely useless, but actually harmful, entailing a high rate of interest and increased cost of management. The *Progress of Society*, 1830, a posthumous publication, treats in simple language of the theories of political economy; the chapters, for example, on value and price are of considerable merit.

[Memoir prefixed to *Progress of Society*.—Chambers's *Biographical Dictionary of Eminent Scotsmen*.—*Dictionary of National Biography*.—M'Culloch, *Literature of Pol. Economy*.] E. G. P.

HANAPER. An ancient office or department of the chancery, so called from the hamper (*hanaperium*) in which certain records were deposited (cp. Petty Bag). It was the duty of the clerk of the hanaper to take account of all patents, commissions, and grants under the great seal, and to collect and administer the fees arising from the same. The office was abolished in 1842.

[S. R. Scargill-Bird, *A Guide to the Public Records*, 1891.] A. E. S.

HANCOCK, William Neilson (1820-1888), was the son of Lord Lurgan's land-agent, and was born at Lisburn, county Antrim. He was called to the Irish bar in 1844, was Whately professor of political economy at Dublin University from 1846 to 1851, and professor of jurisprudence and political economy at Queen's College, Belfast, from 1849 to 1853. From 1851 to 1853 he was secretary to the Dublin University Commission, in 1854 to the Endowed Schools of Ireland Commission, and later to several other commissions on Irish subjects. From 1855 to 1866 with a year's interval he was clerk of the custody of papers in matters of idiots and lunatics in the Court of Chancery, and in 1882 he became clerk of the crown and hanaper. He was the chief founder of the Dublin Statistical Society, 1847, and of the Belfast Social Inquiry Society, 1851. Throughout his active life he put forward his economic and social opinions in writing in the form of articles or pamphlets, all marked by knowledge, discernment, and impartiality.

Hancock's works are: *The Tenant-right of Ulster considered economically*, 1845.—*Impediments to the Prosperity of Ireland*, published 1850.—*What are the causes of the Prosperous Agriculture of the Lothians of Scotland?* and, *What are the causes of the distressed state of the Highlands of Scotland?* 1852, all aim at proving, either directly or by comparison with Scotland, that Irish agricultural distress was due not to the race, religion, perversity, or ignorance of the Irish peasant, but to defective land-laws, and mainly to the want of some equivalent to the Ulster tenant-right.—*Three Lectures on the Questions, Should the Principles of Political Economy be disregarded at the present Crisis? and if not, How can they be applied towards the discovery of Measures of Relief?* 1847, discuss the potato famine, deprecating the artificial lowering of prices, and advocating a uniform system of relief in money.—The *Report on the supposed progressive decline of Irish Prosperity*. 1863, brought forward various statistics to disprove such decline, and attributed the increase of emigration to older and deeper-rooted causes than the potato famine.—The question, *Is there really a want of Capital in Ireland?* 1851 (see *Prosperous Agriculture in the Lothians*, p. 16), he answered in the negative.—His *Duties of the Public with regard to Charitable Savings Banks*, 1852, and *The Present State of the Savings Bank Question*, 1855, exposed, by an Irish example, the evils of the existing system, which allowed limited liability and minimised responsibility by dividing it between government and the managers; and advised the abolition of charitable in favour of government or private joint-stock banks.—He also wrote an article on *Local Government and Taxation, Ireland*, 1875, and edited the first two volumes of the *Ancient Laws of Ireland*, 1865.—In some un-

published essays he treated of *The Use of the Doctrine of Laissez-Faire in investigating the Economic Resources of Ireland*, 1847, in which he recommended the alteration of such laws as interfered with economic development; and of *The Workhouse as a mode of Relief for Widows and Orphans*, 1855, in which he advocated the boarding-out system and outdoor relief for these classes of the poor.

HANDICRAFT. See HOME INDUSTRIES.

HANDSAL. See AUNCEL.

HANSARDS. One of the English names for merchants of the Hanseatic League, EASTERLINGS being the other. Hansard appears as an English surname in 1254. (Mat. Paris, v. 427). R. H.

[The honourable connection of the *Hansard* family of printers with the publication of parliamentary debates need not be commented on here.]

HANSE OF LONDON. This hanse, which had no organic connection with the Hanseatic League, was an association for foreign commerce consisting originally of merchants of Flemish towns. It was established for the promotion and security of trade between Flanders and England. It is a well-known fact that Flanders was dependent upon England for her supply of wool; the *Libell of Englishe Policye* says—

> By draping of oure wolle in substaunce
> Liven her comons, this is her governaunce.

Hence it was natural that a society or league should be formed in Flanders for the protection of her trade with England. As its chief seat or centre of commerce was in London, it was called *hansa Londoniensis;* other names applied to it were *hansa Flandrensis* and "the seventeen towns." Little is known concerning the origin of the association. Though not clearly mentioned before 1240, it seems to have been formed in the second half of the 12th century by seventeen towns of Flanders,—Bruges, Ypres, Lille, Damme, Ardenburg, etc. There is some evidence that a small hanse at Bruges was its original nucleus or starting-point. In the 13th century the number of towns connected with the hanse of London was gradually increased, though the old name, *les dix-sept villes*, was retained. Bourquelot gives a list of fifty-six such towns, many of which were in Hainault and North France,—Ghent, Douai, Arras, Cambrai, Abbeville, St. Omer, Beauvais, Caen, Troyes, Amiens, Rheims, etc.

The hanse of London had the monopoly of commerce with England. Its officers could seize the property of any of their countrymen of Flanders, not belonging to the society, who undertook to trade in England. Besides exercising this monopoly, the hanse protected its members against dishonest dealings; they ceased to have commercial intercourse with any Englishman who had been guilty of fraud in selling wares, or who had acted unjustly toward any one of them. They also traded at the great fairs of Champagne (see MEDIÆVAL FAIRS); the prosperity of these marts was, in fact, largely dependent upon the hanse of London.

Concerning the organisation of the society, the information furnished by its statutes and by other sources is meagre. Its chief officer, "the count of the hanse," was elected by the merchants of Bruges. He presided over its meetings and courts, and was assisted by the standard-bearer, *scildraca*, who was generally a merchant of Ypres. These two officers also acted as treasurers. The statutes mention, moreover, a clerk, or secretary, and *inventores*, or *arbitri*. The *inventores* were judgment-finders or judges who tried cases falling within the jurisdiction of the hanse; eight of these judicial delegates came from Bruges, four from Ypres, and one or two from each of the other towns of the league.

New members were admitted at Bruges and in England. To gain admittance a person had to pay an entrance fee, the amount of which varied according as the applicant was the son of a member or not. Most artisans and retail dealers were excluded from membership, especially weavers, fullers, shearers, carpenters, shoemakers, wool-beaters, dyers "who dye with their own hands and have blue nails," skinners "who work with their hands," tinkers "who go crying through the streets," cheesemongers, buttermongers, and all who sell by the pound. Such persons could become members only by renouncing their craft or trade, and then, after waiting a year and a day, by paying a high entrance fee. They were, moreover, required to bring a certificate from their town showing that they had been admitted to its *caritas*, or mercantile brotherhood, on payment of the fee required by the municipal authorities. The hanse was evidently made up mainly of wholesale dealers, though some prosperous craftsmen seem to have obtained admission.

There was a close connection between the hanse and the towns to which its merchants belonged. The higher municipal officers had to be members of the society; and before being admitted into the hanse, a person had to join the mercantile gild of his town. Hence the hanse of London may be regarded as a loose municipal league, as well as a society of merchants.

The count of Flanders seems to have exercised no direct supervision or authority over the hanse; but, in some cases, there was probably an appeal from the decisions of its court to a superior commercial tribunal of Flanders consisting of delegates from five important towns.

The exact date of its dissolution is shrouded

in as much obscurity as that of its creation. It still flourished in 1349. There seem, however, to be no references to it in the second half of the 14th century, and in 1426 the town authorities of Bruges stated that the regulations of the hanse had long been in abeyance. Its period of life thus covered about two hundred years.

[The best account of the hanse of London will be found in Carl Koehne's *Hansgrafenamt*, 1893, pp. 205-245.—See also Bourquelot, *Foires de Champagne*, 1865, vol. i. pp. 134-139.—Varenbergh, *Histoire des Relations diplomatiques entre la Flandre et l'Angleterre*, 1874, pp. 145-155.—Hegel, *Städte und Gilden der germanischen Völker*, 1891, vol. ii. pp. 185-188.—Ashley, *James and Philip van Artevelde*, 1883, pp. 17-20, 141.] C. GR.

HANSE TOWNS. The number of towns which belonged for a longer or shorter time to the Hanseatic League is uncertain, as the merchants carefully abstained from furnishing complete details, and the names must be gleaned from records. In documents which mention a considerable number, the classification is geographical. The treaty, for example, with King Magnus in 1372 (*Recesse*, ii. 45), though it omits the Westphalian towns, ranges the others under the headings: *Civitates Maritimæ; Civitates Livoniæ, Prussiæ, de Mari Australi* (Zuyder Zee), *Zelandiæ*, *Hollandiæ*, *Gelriæ* (Guelders). It is usually stated that the towns in the 14th century were divided into three groups or circles (see HANSEATIC LEAGUE, p. 283).

The following list of 115 is founded on one in the *Hansische Geschichtsblätter* for 1871, collated with the Hanseatic map in Prof. Droysen's Historical Atlas and other lists, and the results have also been compared with the names of the towns represented at the various Diets up to 1476. These appear, a few at a time, in the official *Recesse*, and form an absolute test of the right of a town to a place on the roll. Those which are now for the first time added on this authority are marked with an asterisk.

Amsterdam	Elburg	*Kokenhusen
Anklam	Emmerich	Kolberg
*Arnemuiden	*Enkhuizen	Köln a. d. Spree
Arnheim	*Fellin	Königsberg
Aschersleben	Frankfurt a. d. O.	Kulm
*Barth	Gardelegen	Lemgo
Berlin	Gollnow	*Lemsal
Bielefeld	Goslar	Lippstadt
Bolsward	Göttingen	Loitz
Brandenburg	Greifswald	Lübeck
Braunsberg	Grimmen	Lüneburg
Bremen	Groningen	Magdeburg
Breslau	Guben	Middelburg
Briel	Halberstadt	Minden
Brunswick	Halle	Münster

Stolpe	Warburg	Zwolle
Stralsund	*Wenden	

Kneiphof, though only one of the quarters of Königsberg, was separately represented at more than one diet at which a representative of Königsberg was also present. It cannot, however, be included in a list of towns.

Official documents give good reason for believing that the following were also Hanse Towns:

Erfurt	Kalmar	Pritzwalk
Greiffenberg	Kyritz	Werben
Havelberg	Nordhausen	
Höxter	Perleberg	

Many other towns are mentioned in the *Recesse* in a way which shows that they were in some degree connected with the Hansa; but it is not possible to give a satisfactory list of them.

The *Kontor* towns were:

Bergen Bruges London Novgorod

To these may be added the following, in which the Hansa either had smaller factories or special privileges:

Antwerp	Helsingborg	Roeskilde
Ardenburg	Helsingör	Skanör
Boston	Hull	Stockholm
Bristol	Ipswich	Svendborg
Copenhagen	Kowno	Warberg (Sweden)
Damme	Lisbon	Yarmouth
Dinant	Lynn	York
Falsterbo	Malmö	Ypres
Flensburg	Norwich	
Ghent	Pleskow	

This list could be much extended, but the question of inclusion or exclusion is one of degree, as the league had dealings far and wide. R. H.

HANSEATIC LEAGUE. An association of German towns which, during the 13th and 14th centuries, secured the entire trade of the countries surrounding the Baltic, exporting their produce to Germany, England, and the marts of western Europe, and carrying back the manufactured goods of the west and the special products of warmer climates.

The word *hansa* is of Mœso-Gothic origin, and denotes an association of a militant character; it also appears in early documents in the sense of a payment (*Hans. Urk.*, i. No. 33). In 1266 the Hamburg merchants were allowed to have *hansam suam . . . per totum regnum* by Henry III.; but the expression *mercatores de hansa Almaniæ* first occurs as a designation of the famous league in the agreement of June 1282 with the city of London, now in the archives of Lübeck.

Monopoly was the watchword of the Hanseatics from beginning to end of their career; but while their policy enabled them, in the infancy of the European nations, to amass wealth and gain power, their blind adherence to the same aims and methods in face of the

discoveries, new economic views, and developed political life of the 16th century, led to the final destruction of their organisation.

No date can be assigned for the first beginnings of the Hansa. No charter or treaty exists to which historians can point as a foundation statute until the year 1367, though, as the Hansa had at that date become the political arbiter of northern Europe, the deficiency is not due to the absence of strong bonds of association at a much earlier period.

There were anomalies in the position of the Hansa. As a power it treated on even terms with princes; it was also a secret society. On paper it was the obsequious servant of the German emperor; but, conscious of the weakness of the central authority, then wasting its strength in Italy, the league never condescended to obey the imperial decrees, and indeed was itself a standing contravention of the Golden Bull of 1356, which forbade all such associations. It could raise fleets and armies—one of twelve thousand men is spoken of—and levy large war-contributions, but it never permitted a complete list to be given of the towns which it included. It sufficed that the Hansa should know its own aims and methods, and it was best that its outlying members should not be too surely recognised by those who held them individually in their power. The Hansa assumed an absolute sway over its members, beheading the four burgomasters of Halberstadt in 1425 (*Contin. Chron. Engelhus.*, Leibnitz, ii. p. 84), and almost ruining those towns which, like Brunswick in 1375 (*Recesse*, ii. No. 93), were for a time expelled; or, like Bremen in 1285 (*Rec.*, i. 34, § 2), unhansed themselves; yet it had no visible executive.

Some of the earliest traces of that which was destined to become the Hansa are found in England, though in reality the league sprang from two centres of growth—the Cologne trade with England and the Lübeck trade with the Baltic.

The calling of a merchant in the 13th and earlier centuries required physical courage and endurance. Mediæval traders travelled with their goods, and were regarded, in foreign countries, with a jealousy largely due to their persistent attempts to work outside the towns and enter into direct commercial communication with producers, thus carrying away with them the profits which, had they traded under municipal restrictions, would have accrued to the native merchant. This was not only an English feeling; its counterpart was found abroad, and it was a cardinal point in the policy of the Hansa to enforce far stricter limitations on English merchants on the continent than those which, in spite of the *Carta Mercatoria* of 1303, were imposed on ordinary foreign merchants in England up to the middle of the 14th century. Partnerships between foreign merchants and its own members were absolutely forbidden by the Hansa, and the celibacy to which the *Kontor* and factory agents were bound was intended to prevent the growth of family agencies.

Usually a foreign merchant had to pay much higher customs dues than a native. He had to buy, or combine to buy, from rulers the right to travel anywhere, and sell in any market; and when, as in the case of the Hansa, these privileges were obtained, he became the hated rival of the native trader, who gladly enforced, when possible, the rough justice of reprisal then in vogue. This system is conveniently illustrated by the letter from Stralsund in the *Literæ Cantuarienses* (Rolls Series, iii. 91), and it will be seen that if a previous merchant, from the same place as the trader himself, had proved a defaulter, or his own city or country had ill-treated merchants of the kingdom he was visiting, his goods or his person might be seized in compensation. Again the roads were not infested by ordinary robbers only, for a duke of Brunswick could condescend to plunder merchants so shamelessly as to force the league to vengeance (*Chron. S. Ægid.*, Leibnitz, iii. 598); and local magnates exacted so many tolls (see INTERNAL CUSTOMS AND TOLLS) that a Hanseatic merchant, travelling from Thorn to Lemberg, a distance of perhaps 360 miles, was forced to pay tolls sixteen times, the toll per horse amounting to over 31 groats (*Hans. Urk.*, iii. 312).

To these vexations were added the natural perils of the sea and the brutality of pirates and wreckers, for so barbarous were the times that a prince, while agreeing to protect merchants from other plunderers, could stipulate for a share of stranded cargoes for himself.

There must have been heavy profits to induce men to run such risks, and it was but natural that they should seek by combination to make these profits more secure, and obtain comfort and mutual assistance when, as frequently happened, they were compelled to winter far from home. These combinations abroad, among men whose temporary sojourn at a distance in no way impaired their ties of citizenship, led to federations at home between the towns, in which the merchant class was then the controlling element. This was a foregone conclusion, for, during the period of the rise of the Hansa, there was no national commerce in Europe; towns everywhere dealt with other towns, and merchants having the same aims and methods tended to frequent the same spheres of activity.

Traces have come down from remote times of a great trade in the Baltic before the 11th century. In 975, for example, Otto II. granted a charter to Magdeburg (*Hans. Urk.*, No. 1), which, by referring to the wanderings of German merchants into barbarous countries, clearly alludes to Russia and the North; and Adam of Bremen, in the 11th century, mentions that the now-vanished city of Julin, or Jumne, was *mercibus omnium Septentrionalium nationum locuples* (Pertz, viii. 312, ll. 15, 22). In Gothland, too, coins of so many Anglo-Saxon kings have been found that the collection made thence is the second best in Europe; and mingled with these tokens of western trade are coins of the caliphs of more than a thousand different types, testifying to the constant communications with the East by the

Caspian Sea, by the Volga, and the other great rivers of Russia. Gothland, and Wisby its chief town, had thus long been marked out as the central depôt of Baltic produce, and in 1163, but five years after the second foundation of Lübeck, we find a rescript of Henry the Lion (*Lüb. Urk.*, p. 4) respecting the behaviour of the natives and the Lübeckers settled in Gothland; while in 1199 Germans and Gothlanders were allowed free commercial access to the principality of Novgorod, which stretched in a north-easterly direction along the Baltic and the frontier of Sweden. Their trade was largely in herrings, which, from the beginning of the 12th century up to the middle of the 16th, seldom failed to drive in shoals through the Sound to spawn in the Baltic; and a hook of land, jutting out from Scania into the Sound, was then the place at which the fish could be best intercepted. There, accordingly, on Danish soil at Skanör and Falsterbo, the Lübeckers had their *vittæ*, or curing establishments, under privileges granted before 1209 by Waldemar II. of Denmark (*Lüb. Urk.*, p. 20). Matthew Paris, however, notes, under the year 1238, that the Gothlanders and Frisians were in the habit of coming each year to Yarmouth to buy herrings (iii. p. 488).

The early Lübeck records contain few traces of other Hanse towns; but in 1225 there are incidental references to the *Lubecenses, Hamburgenses et ceteri . . . mercatores . . . Daciam frequentare volentes*, to assistance given to certain princes in war, to an agreement with Hamburg in 1226 as to mutual privileges, and to the freedom from tolls granted to men of the Baltic shore in the Lübeck customs tariff (*Lüb. Urk.*, pp. 35-38).

The charter conferring mint privileges and the freedom of the empire on Lübeck in 1226 (*ib.* p. 45) refers to merchants trading thence to England, and frees them from the tolls exacted by Cologne and Thiel; but the records are strangely reticent, and under the year 1227, when the *Lubecenses* defeated the Danes at Bornhöved (Langebek, i. 122, 286), there is no Lübeck document clearly alluding to the war except an agreement with Riga and the Germans in Livonia not to make a separate peace. In the *Hansisches Urkundenbuch* (i. 232, 303, 345, 650) are documents of 1229 and later dates which seem to presuppose a league, but though the record evidence is not distinct, the existence of a far-reaching bond of union is apparent from public results of most decided character.

In 1249 it is recorded that Eric VI. of Denmark assailed the *Lubicenses in Scania piscantes* (Langebek, i. 123), and that in revenge they burned Copenhagen. Still no mention of other towns is made by the chronicler; but in 1285 the annalist of the Franciscans of Wisby (Langebek, i. 255) notes that there was war *inter Noricos et Lubycenses ac alias civitates maritimas* which was concluded by the peace of Kalmar; and the chronicler thus uses the actual official title of the Hansa, whose common seal bore the legend: *Signum civitatum maritimarum*. His words are interpreted by the record of the arbitration in the *Hansisches Urkundenbuch* (i. 993), and by the *Annales Lubicenses* (Pertz, xvi. 411-429) which mention, under 1285, Lübeck, Wismar, Rostock, Stralsund, Greifswald, Riga, Wisby, and two Netherland towns, Kampen and Staveren, as those concerned.

The same annals show, under the year 1310, an association between Greifswald, Stralsund, Rostock, and Wismar, which Lübeck declined to join (*Hans. Urk.*, ii. No. 175); and the northern chronicles (Langebek, vi. 222; i. 258) mention the burning of Helsingoër and Skanör by the *civitates stagnales*, or Hanse towns, in 1312, and the siege of Stralsund in 1316. They then proceed to give weary evidence of smouldering warfare up to 1361, when Waldemar III. of Denmark began an attack on the league which really led to its final organisation. At this date the merchants had a very long seaboard open to attack, for they had followed in the wake of the Teutonic knights, and had founded fourteen cities along the Baltic shore as far as Reval and a great factory farther away at Novgorod, so that the time had visibly come for firmly banding together all who had a common aim.

Turning now to the western half of Europe, the Laws of Æthelred (A.D. 978-1016) show the *homines imperatoris* coming to England in their own ships and enjoying special privileges; and William of Malmesbury, writing before 1142, describes London as being crowded with German merchants (*De Gest. Pont.*, ii. § 1). In 1157, too, there is a charter of Henry II. referring to the *gildhalla* of the Cologne merchants in London, followed by Richard's charter given to the same merchants at Louvain in 1194 (*Hans. Urk.*, i. 14, 40); but probably the earliest direct evidence of a western league is furnished by the charter of 1252 granted to the merchants of Cologne, Dortmund, Soest, and Münster *et aliis cum iisdem concordantibus* (*Hans. Urk.*, i. 428). The history of this branch of the Hansa is intimately connected with the history of English commerce (see STEELYARD), though it is certain that the Baltic merchants were also in constant communication with London, Lynn, and the eastern ports. The Cologne or Westphalian association presents, however, few historical features of interest until the eventful year in which, as stated above, the great war with Denmark began. Waldemar III., who had long endeavoured to free his kingdom from foreign influences, struck, in 1361, a treacherous blow at the league by sacking the town of Wisby in time of peace (Langebek, i. 259). At once negotiating an alliance with Norway, the merchants laid a tax on all the exported goods of their league, equipped a fleet, and plundered

Copenhagen. They were besieging Helsingborg when Waldemar, surprising their ships, compelled them to retreat (*Recesse*, i. 374, § 10). Negotiations followed, but the war broke out again, and on the 11th of November 1367, a general council of seventy-seven towns was held in Cologne, at which the *nuncii civitatum de Hanza Theotonica* (*Recesse*, i. 412, 416) drew up the Act of the Cologne Confederation, which was thenceforward regarded as the foundation-statute of the avowed Hanseatic League.

It was to these deputies (Langebek, vi. 228) that king Waldemar addressed his mocking quatrain beginning,

Seuen und Seuentigh Hensen
Hefft seuen und seuentigh Gensen.

But in the year following they had driven Waldemar from Denmark, and the peace of Stralsund was concluded in 1370 during his banishment (*Recesse*, i. 523). By it the Hansa obtained for fifteen years the castles and the bulk of the revenues of Scania, freedom from all tolls in the Sound, and a control over the succession to the Danish crown (*Rec.*, i. 524, l. 33).

This great change in the position of the Hansa was marked by a state visit in 1375 of the emperor Charles IV. to Lübeck as the chief of the confederated towns. He sought political aid in vain from the new power, which had reached its highest level, but he was loaded with gifts instead.

The extant records of the league now begin to assume a different character. The series of minutes of diets begin with those of the Wismar diet about 1260. These early *Recesse* must not, however, be supposed to relate to the league as a whole. No general assembly is known to have taken place before that in 1367, referred to above, and it is certain that small associations of towns sometimes took separate action (Pertz, xvi. 421). The early series of *Recesse* is broken, being not continuous until about 1364; but neither then, nor afterwards do the records reveal any standing council or high officials, though such may have existed, for the chronicle in Langebek (v. 235) states that in 1428 the *communitas urbium* rebelled and created for themselves *novum concilium et senatum*. Another sign of organisation, not connected with the filiation of towns, is observable in the earliest *Recess*, which refers to statutes made for the benefit of all merchants *qui jure Lubicensi gaudent et reguntur*. When they became annual these diets were frequently held at Lübeck, then admittedly the leading city, and one of its burgomasters usually presided.

The correspondence, the treaties, and the *Recesse* themselves disclose the names of the Hanse towns a few at a time (see HANSE TOWNS). It is usually stated that they were divided into three groups, Lübeck leading the Wendish, Pomeranian, and Saxon towns; Wisby the Gothland and Livonian; and Cologne the Westphalian; but a document of 1366 (*Rec.*, i. 381) shows a *terciana Lubecensis*, a *terciana Wisbicensis*, and a *terciana* consisting of Prussian towns. Certainly Cologne formed a fourth *terciana*, so the word cannot be taken in its ordinary sense. The truer classification is perhaps shown by a letter of 1372 (*Rec.*, ii. 45), though it omits Cologne. At a later date Lübeck, Brunswick, Danzig, and Cologne were leaders of regions or circles. For a time Wisby had held a great position in the Baltic, and the dues from the Hanse towns were paid into a common treasury chest there under the care of four aldermen from Wisby, Lübeck, Soest, and Dortmund; but after the sacking of Wisby in 1361, every sign of leadership passed to Lübeck. In the 14th century Lübeck began to coin gold, twenty shillings of twelve groats each being equal to one easterling pound (see EASTERLINGS), and a large banking business sprang up there, bills of exchange being generally payable at Lübeck or at Bruges.

The lists of towns attending these diets reveal the broad fact that the coast towns from Reval to Middelburg were the really active members of the Hansa, and on them fell the brunt of fighting and negotiation. Even after 1367, Cologne, proudly reluctant to cede precedence to Lübeck, seldom sent representatives, while the rest of the inland towns were almost equally backward. Sometimes the diet, in fixing a place for the next meeting, would require towns to send their deputies to answer complaints; but often only those of four or five seaports appeared, though at crises the list became much longer.

The business of the diets was varied. Fines were received from recalcitrant members; letters were written to foreign princes demanding redress for merchants; questions of peace and war and of alliances had to be decided, war expenses apportioned, old privileges maintained, and others won by negotiation. Laws, too, were made touching commercial conduct, and even the morals of the merchants (*Recesse*, i. 9). Letters on these matters may be read in the Lübeck *Recess* of 1366 (i. 376); and it may be remarked that these documents have a special interest in connection with the growth of the LAW MERCHANT (*q.v.*). The trade of the Easterlings was not speculative. Transactions were settled by barter or by cash payments on the transfer of actual commodities, and credit was almost entirely prohibited. Resolute selfishness marks all the acts and writings of the Hansa. It had fixed aims which it pursued untiringly, the chief being to gain absolute control over the Belt and the Sound. The league's desire was that no ship but a Hanseatic ship should pass in or out of the Baltic, or trade anywhere in that sea; and, broadly speaking, the will of the Hansa prevailed up to the beginning of the 16th century, though the English ADVENTURERS, MERCHANTS could not be wholly shut out. So jealously guarded was this region that the early cartographers, who could delineate Africa and show the position of Japan, had to rely on the Ptolemy maps for Europe above N. lat. 53°. This policy of exclusion proved, of course, unendurable to Sweden and Denmark; and with the latter power, which held the Sound, the Hansa was involved in many wars.

About 115 towns were, at one time or another, included in the Hansa, and the position of a few

more is uncertain. It had four great *Kontore* or organised establishments, Novgorod, Bruges, London, and Bergen, and about twenty-eight factories in foreign countries which enjoyed special privileges.

These *comptoirs*, of which the STEELYARD was the most important, differed somewhat according to the nature of the countries in which they were established. The one at Novgorod formed a separate quarter of the town, clustered round a church. Here the merchants lived, as they sought to do everywhere, under their own *Skra* or code of laws (*Lüb. Urk.*, i. p. 700), and maintained a celibate establishment under an elected alderman —a kind of merchant abbot over a commercial monastery, which, like some other early monasteries, had also the characteristics of a fortress. At Bergen about 3000 persons thus lived together in one community, though subdivided according to the towns they represented. By unscrupulous methods they ousted the Norwegians from the whole of the harbour, and even limited the number of Hanse cities which should share the trade. The expenses of these factories were paid mainly by duties on ships ; but each town defrayed the cost of the maintenance of its own staff. In all the *Kontor* towns the Hansa had gained great privileges in the way of remission of customs dues. Even as late as the 29th year of Henry VIII., the Hansards were so favoured that, for instance, they exported 33,778 pieces of cloth as against 4608 by other foreign merchants ; whereas in 31 Henry VIII., when the latter were allowed to pay "Englische custome" only, the totals were 27,260 for the Hansa, and 24,566 for the others (Cott. MS., Claud. E. vii. *f.* 99).

Notwithstanding fierce quarrels with Denmark, the Hansa obtained thence grain and cattle ; and the merchants derived from their own curing establishments on Danish soil in Scania the herrings which they carried to Germany and western Europe. From Sweden the Hansa exported wood, furs, iron, copper, fish, cattle, and corn ; importing, among other things, silk stuffs, cotton, hops, salt, spices, and wines. Until the days of Gustavus Vasa, the entire trade of the country was in the hands of the league ; and the same may be said of the Russian trade, until the early part of the 16th century, when Ivan the Terrible sacked Novgorod. Even after that, the Hansa sought to revive the monopoly ; but the English, the Netherlanders, and the Danes had forced themselves into the Russian trade, and could not be driven out again. While their advantage lasted, the Hansa had exported from Russia furs, leather, wax, honey, tallow, hair, gold, and silver ; bringing for Russian use, corn, flour, smoked meats, herrings, beer, wine, Dutch and English cloth, thread, furriery and mercery, copper, zinc, and lead. In Norway, the Hansa had swooped down on the long-established trade of Bergen with Greenland, Iceland, and the Arctic seas, and thrusting aside the natives, had taken to itself, as far as English enterprise allowed, the entire produce of the whale and seal fisheries, the furs, tallow, cod, herrings, and other products of the north. Western and southern Europe formed the opposite pole of the Hanseatic trade, and all the produce of the north and east which was not absorbed in Germany came by sea to Bruges or to London (see STEELYARD). In Bruges, the Hansa merchants met the produce and manufactures of England, Flanders, Spain, Italy, the Levant, and the East, and transacted business with men of all nations. The customs tariff of Bruges in 1380, recorded in the archives of Hamburgh (*Rec.*, ii. 209), shows that the following were the less ordinary articles of commerce which the Easterlings might obtain at Bruges to carry back to the Baltic :—alum, sulphur, tartar, saltpetre, borax, zedoary, saffron, cubebs, rhubarb, tansy ; silver, tin, quicksilver, verdigris, vermilion, lapis-lazuli, indigo ; almonds, liquorice, caraway, anise, pepper, long pepper, ginger, grains of paradise, cinnamon, nutmegs, cloves, mace, cardamoms, rice, loaf sugar, figs, dates, raisins ; Spanish wax, boxwood, frankincense, cotton, and paper. A tariff of 1252 shows swords, shields, armour, copper utensils, boots, cork floats, cloth of many kinds, wood, linen, beer, wine, peltry, and other goods useful in countries like Norway, Sweden, and Russia, which then had absolutely no manufactures of any kind.

Similar information may be obtained from the inventories of the cargoes of two ships, one of which belonged to Thorn. It contained a surprising amount of gold and silver, and some silk (*Hans. Urk.*, iii. 63, 260).

Such was the power of the Hansa, that it compelled all ships, except those bound for England or the Baltic, to stop at Bruges ; thus obtaining the chance of being the first buyers of any coveted product. But this prosperity was too great to last. Late in the 15th century, the insolence of the men of Bruges had brought ruin on their own city, and the Hansa, when too late, transferred its factory to Antwerp, only however to find there failure and disappointment.

With France, the league had comparatively little direct dealing. A large part of the French coast was for long periods in English hands ; France had, through Marseilles and other southern ports, direct access to the vast trading centres of the Mediterranean ; her northern boundaries ran close to the great Flemish towns ; and finally, during the 13th and much of the 14th centuries, Amiens, Rheims, Caen, Beauvais, and other towns were included in the HANSE OF LONDON, and had little inducement to join the league.

At Lisbon, the league had a factory through which it obtained Levantine and Oriental goods ; but the principal part of the trade with the Italian cities passed overland to Augsburg, Nuremberg, Ulm, and other south German cities which formed a collateral Hansa, and had a factory at Venice.

The great trade with England was mainly concentrated in London ; though there were establishments also at Bristol, Ipswich, Yarmouth, Norwich, Hull, and York, and Hanse houses at Boston and Lynn (see Lappenberg's *History of the Steelyard*). Roll No. 268 in the *Miscellanea of the Exchequer* at the Public Record Office, is the account of the customs dues at Lynn for 1286-87, and shows a duty of 6s. 8d. on each sack of wool weighing 2 cwts. Hides and leather were likewise exported. In the roll for 1302, cotton thread, silk, sugar, and spices appear among imports ; while cloth, dyed and undyed, was exported by the Easterlings, though

there was direct English trade with Norway as well. Of trade with Scotland there are many traces in the *Recesse* and in the Nuremberg *Chronicle*. An interesting letter of invitation to traders from Sir William Wallace, in 1297, is preserved in the archives of Lübeck.

The Hansa did not remain long at the high level of prosperity attained in the second half of the 14th century. The end of the first quarter of the 15th saw the beginning of the decline. The Hansa had grown into a league at a period when Europe generally contained a servile population, no middle class, except in the towns, and few manufactures; but the feudal and the manorial systems had both collapsed in England; the new race of tenant farmers had appeared in the country; and a manufacturing population controlled by craft gilds (see CORPORATIONS OF ARTS AND TRADES; GILDS), had sprung up in the towns; meanwhile the nation, unified by parliamentary representation, was fast developing a national policy as regards trade, and awakening to a consciousness of vigour and of resources which it could not allow to be controlled by a selfish company of foreigners.

Changes had also been taking place all over Europe; even in the Baltic the trade created by the Hansa had been elevating the once simple races. Unseen natural forces, too, were joined against the merchants, and the herrings, which had been perhaps their greatest source of wealth had begun to change their annual course, to the lasting benefit of the Netherlands.

Europe began to see that the Easterlings, or *Ostrelins*, as the French called them, were little more than mere carriers of products, representing neither industrial population nor manufacturing centres. The western and northern nations began to insist on not being excluded any longer from direct trading relations with each other; yet to threaten the monopoly of the Hansa was still to bring the sword of the confederated cities from its scabbard, and offenders found themselves confronted either by open war, by secretly encouraged raids of pirates, or by the disfavour of sovereigns whom Hanseatic bribes and loans had won over in spite of their better judgment. The once peaceful Hansa now appeared as a tyrant desperately endeavouring to keep up an effete system of privileges and monopolies by threats and violence. The Dutch, once members of the Hansa, had had a fierce war with Lübeck in 1438, and again seceded from the league at the end of the 15th century, boldly coming forward as its commercial opponents. They soon developed such a trade that it was a fleet of no less than 250 sail upon which the Lübeckers fell in 1511 as it was leaving the Baltic; and when at the opening of the 16th century, Charles V. found himself at the head of an empire with larger interests than those of the Hansa, he wisely favoured the energetic Netherlanders, and looked coldly on the allied cities so threateningly independent of his power.

The discovery of America, and of the new passage to the East Indies round the Cape, had begun to draw trade into other channels; while the printing press, which quickly found its way to Sweden and Denmark, was undermining a power largely dependent on the ignorance of the nations it traded with. The Hansa, in fact, was bound to give way in the presence of an altered world; but it declined to do so, and blindly refused to change its ideas and methods.

Within the league, too, there was dissension, and the inland towns began to find that their interests no longer coincided with those of the coast towns, whose carrying trade was beginning to slip away.

Reverting, however, to the chronological series of events, the annals show that for many years after the conclusion of the peace of Stralsund, in 1370, the Hansa was in an almost continuous state of warfare. First the piratical *Vitalienbrüder* had to be suppressed (*Recesse*, iv. 279, 330, etc.), a work not ended until 1402; then a long and bloody war ensued with Eric the Pomeranian, ruler of the three Scandinavian countries, lasting up to 1435. Five-and-thirty years afterwards the Hansa, at variance since 1452 with the English, was, as Philip de Commines states, at war both with England and France, and came nigh to changing the course of English history by the capture of Edward IV. at sea off Alkmar. The war was concluded by the peace of Utrecht in February 1474, which restored to the Hansards all their privileges in England, and delusively promised reciprocity to the English merchants in the league towns. Cologne had taken the side of England in these quarrels, and had receded from the Hansa, but was re-admitted in 1476 (*Fœdera*, xii. 36).

A war in 1518, between Christian II. of Denmark and Sweden, which enabled the merchants to play once more the part of king-makers, proved disastrous to them; for Frederick and Gustavus Vasa, to whom they had given thrones, identified themselves with the interests of their newly-gained kingdoms, and with splendid ingratitude determined to break the power of the Hansa. The war which ensued is connected with the spread of Lutheran doctrines, and with the endeavours of Jürgen Wullenweber of Lübeck to gain actual possession of the Sound. He failed, and the outcome of the war in 1534 was the total loss of Scania to the Hansa.

The three Scandinavian nations were now able to trade openly on their own account, while the voyage of Richard Chancellor to Archangel in 1553, and the establishment in England of the RUSSIA COMPANY, turned the flank of the Hanseatic trade with Russia. Other heavy blows, too, now fell on the league. The Czar, Ivan IV., saw that the time was ripe for a descent on Livonia, and no effective resistance being made either by the Teutonic knights or by the Hansa, the country was divided in 1561 between Russia, Sweden, and Poland.

Soon afterwards Lübeck, allying herself with Denmark, entered on a protracted war against Sweden, only ended in 1570. No benefit

accrued from these exhausting efforts; the seizure of Bornholm by the Danes, a serious loss to the league, followed in 1576. A worse event happened when, after a lengthy quarrel with the Hansa respecting its failure to carry out the provisions of the treaty of Utrecht, Queen Elizabeth answered the Emperor Rudolph's expulsion of the Merchant Adventurers in 1597 by closing the Steelyard in February 1598. A naval power that had beaten the Armada, could not be excluded from any sea or from any market; it was indeed wonderful that the Hansa had maintained its ground so long in face of the Mercantilist ideas then dominant in England (see MERCANTILE SYSTEM).

In 1586 the Czar Feodor Ivanovitch restored the factories of Novgorod and Pleskow, but the Swedes and the Poles, no less than the English, Danes, and Netherlanders, interfered with the trade; and when in 1603 the Czar Boris refused to recognise any Hanseatic town except Lübeck, internal dissensions were added to the difficulties which the Baltic powers threw in the way of the league.

In no quarter of Europe was there any ray of hope for the now obsolete Hansa; and, when the Thirty Years' War began, dissolution came with it very speedily, and the material prosperity of Germany, the results of the laborious industry of her merchants, was entirely lost.

The last minutes of a diet are of that in 1628, though another was held in 1630; and after the peace of Westphalia, in 1648, only Lübeck, Bremen, and Hamburg remained to make an unsuccessful effort to revive the league. A number of deputies met in 1669, but dispersed again without having effected anything. The three great cities, as free cities, were recognised by the treaty of Vienna in 1815, and as free cities and sovereign states now form part of the German Empire.

HANWAY, JONAS (1712-1786), was a merchant and philanthropist. Apprenticed at Lisbon, he began his mercantile life there, but soon returned to London, and in 1743 went to St. Petersburg, where he entered into partnership with an English merchant, and was commissioned by the Russia Company to carry on the attempt begun by John Elton to establish a British trade in wool in Persia and on the Caspian Sea. After more than a year of strenuous effort and perilous adventure he returned to St. Petersburg; the new trade did not prosper, mainly on account of Elton's behaviour. In 1750 Hanway left Russia and began a life of active benevolence in London, where he was the first man to use an umbrella, a chief promoter of the Marine Society, of the Magdalen Hospital, of plans for benefiting chimney-sweepers, for paving the streets, for reforming the Foundling Hospital, for establishing Sunday schools, and, above all, for preserving the lives of "parish infants," among whom the mortality was then extraordinarily high. In 1762, at the instance of some London citizens, he was appointed a commissioner of the victualling office, in recognition of his public usefulness.

Hanway's writings, seventy-four in number, chiefly occasioned by his philanthropic schemes, are, like his work, miscellaneous and humane. Only the following need be mentioned:—The *Essay on Tea*, known through Dr. Johnson's review of it.—*Historical Account of the British Trade over the Caspian Sea*, etc., to which is appended *The Revolutions of Persia*, a detailed and interesting account of his travels and observations, and *Letters on the Importance of the Rising Generation of the labouring part of our fellow-subjects*, containing plans for increasing the population by preserving infant life, with some account of the London death-rate and an estimate of the expectation of life at different ages.

[Pugh's *Remarkable Occurrences in the Life of Jonas Hanway, Esq.*, 1787 (abridged in 1798).—*Gentleman's Magazine*, 1786, p. 812.—*Dict. of National Biography.*] E. G. P.

HARCOURT, FRANÇOIS EUGÈNE GABRIEL, Duke of (1786-1865), was from his youth a steady and brilliant champion of liberalism under its different shapes, and the defender of the Greek and Polish national causes. He became a member of the French house of deputies, and of the house of peers (from 1837); he was also sent as French ambassador to Madrid (1831), shortly afterwards to Constantinople, and in 1848 to Rome, where he succeeded Rossi. In 1849 he resigned the latter embassy, and lived in retirement on his estates until his death.

In 1846, he accepted the presidency of the *Association pour la Liberté des Échanges*, with Bastiat as secretary; his *Discours en faveur de la Liberté du Commerce* (in the French parliament) were published 1846, in Paris. He insists mainly on the argument that private interests

ought never to be privileged at the expense of the general welfare, and that free competition is the only available method to secure this end. E. Ca.

HARD-DOLLAR (or *peso duro*). Old Spanish silver coin.

Year.	Weight.		Fineness.	Value.	
	grains.	grammes.		In silver 925 fine at 5s. 6d. an oz.	In standard silver francs 900 fine.
				s. d.	francs.
1707-1728	423·89	27·468	930·50	4 10½	5·68
1728-1772	417·74	27·064	909·72	4 8½	5·47
1772 [1]	,,	,,	902·78	4 8	5·43
1848	405·75	26·291	900·00	4 6¼	5·26
1850	402·87	26·105	,,	4 6	5·22
1854-68	400·64	25·960	,,	4 5½	5·19

The subdivisions were all of proportionate weight and fineness until the year 1864, when the escudo (or half-duro) only was of the same fineness, the other fractional coins becoming merely tokens of the fineness of 810, though retaining weights proportionate to the dollar.

In 1868 the coinage of pesetas (francs) was commenced in Spain, and has since been continued. F. E. A.

HARD MONEY. This term is locally applied in the United States to metallic money as distinguished from paper issues. The advocates of hard money are in general opposed to the Soft Money or Greenback party. The term came into frequent use during the political discussions in the decade 1870-80, in favour of the resumption of specie payments. D. R. D.

HARDENBERG, Karl August, Prinz von (1750-1822), an eminent Prussian statesman, was born at Essenrode in Brunswick-Lüneburg. He belonged to an old Hanoverian family. In 1766 he went to the university of Göttingen, and in 1768 to that of Leipzig,—in the latter making the acquaintance of Goethe. Returning to Göttingen, he there pursued the study of jurisprudence; and in 1770 entered the civil service of Hanover. In the course of some travels in Germany in 1772-73 he stayed for a time in the house of the Freiherr von Stein, father of his future colleague. He conceived an affection for a daughter of the family, but by the influence of his relatives was led to marry, in 1775, a Countess von Reventlow, who by her subsequent conduct ruined his domestic life. During a residence in England in the neighbourhood of Windsor in 1781 he discovered a liaison of his wife with the Prince of Wales which had already created a good deal of public scandal; he quitted, in consequence, the Hanoverian service, and entered, in the following year, that of the Duke of Brunswick. In 1787 he divorced his wife, and married another who seems to have been little more reputable. The Margrave of Ansbach and Bayreuth, who belonged to the house of Hohenzollern, being soon after desirous of getting rid of his principal ministers, asked the king of Prussia to send him new advisers; and amongst these Hardenberg was appointed. The Margrave, weary of the task of governing, resolved before long to abdicate in favour of Prussia, to which power on his death his territories were to fall; and thus Hardenberg, in 1791, became a Prussian official, and was charged with the entire administration of the two provinces,—which he conducted with great ability. He was employed in 1795 to negotiate with France the treaty of Basel, by which the apparently prudent, but ignoble and ultimately disastrous, neutrality of Prussia was established. From this time his biography is inseparably bound up with the political history of Prussia. He was a member of the supreme finance directory, and during the frequent absences of Haugwitz from Berlin took his place in the conduct of foreign affairs, though the policies of the two ministers were different—Haugwitz favouring subserviency to Napoleon, and Hardenberg advising close relations with Russia and hostility to France. Haugwitz had to resign office in 1806, and was succeeded as foreign minister by Zastrow. The latter retired in February 1807, and after a time Hardenberg took his place, with a kind of dictatorial position. He already saw that a radical reform of the Prussian state was necessary—in fact, a revolution like the French, but one to be effected by peaceful means. At the darkest hour of the reign of Frederick William III. he said, "The question now is of discovering additional resources to save ourselves; later it will be of a thorough regeneration." But he was soon compelled to quit office. Napoleon, finding in him an obstacle to his designs, after the battle of Friedland insisted on his removal, which the king was not in a position to refuse; and accordingly on the eve of the peace of Tilsit he retired to Riga; and Stein, who had been dismissed some months before, was recalled and entrusted, as Hardenberg had been, with a sort of dictatorship. At Riga, whither he was accompanied by Altenstein and Niebuhr, Hardenberg drew up a memoir on the reorganisation of the Prussian state, which is sometimes spoken of, though not very appropriately, as his political testament. In this memorable document he distinctly indicates, and even insists on, all the measures afterwards embodied in what is known as the Stein-Hardenberg legislation (which will be found described in detail in the article on Stein); and also suggests the abolition of gilds and a movement in the direction of a representative constitution. These measures were, of course, not devised by Hardenberg alone: they were partly the fruit of the matured convictions of the ablest German thinkers, who had converted the great majority of the nation to similar views, and were directly the result

[1] Same as the Mexican dollar.

of the deliberations of the Immediate Commission formed during Hardenberg's tenure of office, of which Altenstein, Schön, Niebuhr, and Stägemann were members. But he cordially adopted the plan—to which he had probably himself largely contributed,—supported it with all the weight of his influence, and loyally urged upon the king the necessity of confiding in Stein as the man most able to deal with the crisis.

When Stein, denounced and proscribed by Napoleon, was forced to leave Prussia, Hardenberg returned to office (June 1810), with the title of chancellor of state; and this position he held to the end of his life. He continued the work of social and economic reform which had been done under the leadership of Stein; indeed, in his agrarian legislation his measures were too radical to receive the approval of Stein, who was less mastered by the modern spirit, and more disposed to preserve and improve old German institutions than to follow what were then called "French models." By his foreign policy, cautious or energetic as circumstances dictated, Hardenberg piloted Prussia successfully through the stormy period which intervened between his return to power and the fall of Napoleon. Because he remained in office during the evil days of 1811-12, he was often accused of acquiescing in the degradation of his country. But he was really all through faithful to Prussia, and his temporary attitude of submission to France seemed to him imposed by the necessities of the situation. He was one of those who signed the peace of Paris in 1814, and on its conclusion was raised to the dignity of prince. He attended the congress of Vienna, and, some years later, those of Aix-la-Chapelle and Verona. He procured from the king, in May 1815, an edict promising the establishment of a system of popular representation; but under the influence of the reaction which prevailed in Germany in 1818 and 1819, this promise was broken, and instead of a states-general, the plan of provincial estates was adopted, which subsisted till 1847. Hardenberg was placed in a false position by continuing to hold the chancellorship when reaction was dominant; and though he was to the last in feeling and principle a reformer, his policy became so indeterminate and ambiguous that when he died, on his return journey from the congress of Verona, Stein declared his disappearance to be a happy event for the Prussian monarchy. But this was a harsh, not to say unjust, judgment, inspired, doubtless, in a great degree by the gross irregularities of the deceased statesman's private life. Be this as it may, Stein and he are indissolubly associated as fellow-workers in a great cause; and, as Ranke has said, whatever weaknesses or sins may be chargeable to Hardenberg, his name is written in imperishable characters on the history of Prussia.

[The materials for Hardenberg's biography used to be drawn from the *Mémoires d'un homme d'état, '92-'15*, which were popularly supposed to be his work. It is now known that this idea was unfounded. His genuine memoirs were edited by Leopold v. Ranke in 1877; they deal, however, only with the years 1804-7. Ranke also published a work of his own, supplementary to the Memoirs, *Denkwürdigkeiten des Staatskanzlers Fürsten von Hardenberg*, 3 vols., 1877. Much information respecting Hardenberg will be found in the late Sir J. Seeley's *Life and Times of Stein*, 3 vols., 1878, which has been largely used in the foregoing sketch.] J. K. I.

HARMONIES OF ECONOMICS. The theory that individual interests consciously pursued as such are naturally harmonious was early suggested by many writers, but it was first definitely stated by Henry C. Carey in America, and Frederic Bastiat in France, two writers whose works appeared within a year of each other, and whose conflicting claims to originality have never been satisfactorily decided. They sharply antagonise the English school, especially as represented by Ricardo and Malthus. The most important of these conclusions to which exception is taken are thus summed up by Bastiat in his *Harmonies Économiques*, published in 1850.

(1) *The Theory of Value.*—While claiming that value originates in labour, they had agreed in attributing value to natural agents, including land, on which no labour had been expended. These goods, which had cost nothing, were none the less appropriated and made to command for their owners the labour of other men. This Bastiat characterises as "evident injustice."

(2) *The Ricardian Theory of Rent*, according to which the price of the products of the soil is determined by the labour needed to produce them on the least productive soils in cultivation. The excess produced on the more productive soils goes to the landowner as rent and increases in absolute and relative amount as the poorer lands are called into cultivation. The result of this law is stated thus: "Increasing opulence for men of leisure; increasing misery for men of toil; in a word, foreordained inequality."

(3) *The Malthusian Theory of Population.* Population tends to increase more rapidly than subsistence, and this tendency, so disastrous to well-being, can be counteracted only by self-control, which "no one thinks of," or by vice, misery, war, pestilence, famine, etc. The conclusion of this law is stated as "inevitable pauperism."

Against this trio of "evident injustice," "foreordained inequality," and "inevitable pauperism," which together constitute a "theory of discord," Bastiat protests with fervid eloquence rather than with severe logic, or observation of life. He undertakes to prove: (1) That value is due wholly to labour, or

more exactly to services rendered to one person by another; (2) that natural agents as such—"the gifts that God had lavished gratis upon his creatures"—are not and cannot be appropriated; that land values represent only the labour which would be necessary with present methods to bring land from a wild state to its present condition; (3) that the return to capital increases absolutely but decreases relatively as capital is increased in amount; (4) that the return to labour increases both relatively and absolutely as capital increases; (5) that "other things being equal, the increasing density of population is matched by an increasing facility of production."

This "theory of harmony" promises increasing prosperity to all the factors of production on one condition on which Bastiat is never weary of insisting,—namely, *liberty*. Since self-interest, when pursued ever so eagerly, or with ever so great indifference to other men's interests, works good to all, all interference with its action is necessarily detrimental. The state should absolutely limit its function to the maintenance of "justice" (a most ambiguous limitation). Laws restricting the exchange of commodities or otherwise interfering with industrial liberty under pretext of securing harmony of interests are not only destructive to that harmony which can only coexist with liberty, but they are a violation of natural right. This 18th-century argument is one to which Bastiat continually recurs. In logical consistency with his system, he carries the doctrine of *laissez-faire* to its utmost extreme.

Bastiat's proof of the proposition mentioned is peculiar. His one method of argument is that of illustration, a method no doubt legitimate, but usually inadequate and always liable to abuse. Bastiat certainly abused it. It is easy to find cases where value is proportioned closely to labour expended, and a long enumeration has great power over the mind, but when the value of a diamond accidentally picked up is attributed to the labour of appropriation, the argument is strained, to say the least. Still less satisfactory is his treatment of rent. His somewhat piquant imaginary conversations, between a landowner and a would-be purchaser of his products, or his land, completely ignore the fact on which Ricardo's whole theory is based, namely, the unequal productivity of different soils. Disregarding this inequality, Bastiat, as Loria nowadays, asserts that rent is impossible while free land remains. His brilliant language hides his argumentative weakness. While not denying the tendency of population to increase, he sets off against it the constant improvement of production, and assumes that the tendency is innocuous. He thus of course denies the law of diminishing returns, a law which is at best but modified by the facts he adduces. His theory of capital is in accord with the known tendency of the rate of interest to fall as capital increases, and is little more than a statement of this fact.

Bastiat's optimism is unrivalled in its *naïveté*, and his propositions, even if proved, by no means justify it. Granting that rent is but the payment for services rendered by the land owner "*or his forefathers*," is there no possible "injustice" in a law of unmitigated inheritance complicated by the vicissitudes of conquest, and sharp bargaining? If capital obtained a relatively smaller share of the product as its amount increases, there still remains the tendency of capital to accumulate in few hands, and thus the relative importance of the *capitalist* may be constantly increasing. The ENTREPRENEUR is ignored by Bastiat, and still more the factor of MONOPOLY, which seems to appear on the scene as naturally as any other factor.

The wide divergence between Bastiat's theory of harmony and the facts of life under every variety of industrial *régime* suggests the fundamental fallacy of his system. It rests upon a false theory of nature. The involuntarily social activities of men are assumed to be natural; the voluntary activities are artificial and *un*-natural. Nature, thus narrowly conceived, is held to be ordained by a beneficent creator; the artificial, simply because it is contrary to "nature," violates the divine law and natural right, and is pernicious. This was the philosophy of ROUSSEAU and the 18th century.

Henry C. CAREY (in *Harmony of Interests*, published 1849) agrees with Bastiat, if indeed he did not furnish his fundamental propositions. Unlike Bastiat, however, he appreciated the value of arguments from real life; and while making large use of fanciful illustration, he contributed other arguments of more importance. The chief of these is his argument on rent. Ricardo assumes that men begin cultivation on the best lands, and then descend to the poorer. But Carey tries to prove from history that the opposite has been the case. The evidence adduced is worthy of consideration, though hardly conclusive. Aside from this, however, Carey seems to have overlooked the fact that the chronological order of settlement was an accident of Ricardo's formula, not its essence. When soils of unequal productivity are once in cultivation, the disparity gives rise to rent, whichever was cultivated first.

A more noteworthy result of Carey's observation was his conversion to the theory of PROTECTION. Realising that the agricultural and manufacturing interests are complementary and necessary to each other, he was impressed by the fact that the development of one in the United States, and the other in England, largely destroyed that mutual helpfulness, so great was the barrier of distance and the cost of transportation. American interests plainly required the development of both

together. A study of the shifting commercial policy of the United States led him to conclude that a policy of protection was necessary for this. To the promotion of this policy he therefore devoted nearly the whole of his first book, the *Harmony of Interests*. Advocacy of state intervention thus became as pronounced with Carey as that of *laissez-faire* with Bastiat. Thus, while the two agree in rejecting the "theory of discord" of Ricardo and Malthus, and in emphasising the harmony and beneficence of the natural order, Carey freely recognises as belonging to that order forces which Bastiat had denounced as destructive of liberty and so of harmony. Under either form the theory of harmony of interests is optimistic—more so, it will seem to many, than the facts will warrant; but, as stated by Carey, it at least stands for juster premises, broader recognition of facts, and sounder methods of inquiry, than with Bastiat. Neither writer has had disciples of note, though extensive use has of course been made of their arguments.

[In addition to Bastiat's *Harmonies économiques* and Carey's *Harmony of Interests* already mentioned, may be cited Carey's larger work, *Principles of Social Science;* also criticisms of their theories in Ingram's *History of Political Economy*, Walker's *Land and its Rent*, and especially Böhm-Bawerk's *Capital and Interest*, Smart's translation. Bernard de MANDEVILLE advances the theory that selfish interests advance the public welfare, in his *Fable of the Bees or Private Vices Publick Benefits*, published in 1714. The belief in a harmonious natural order also pervades the writings of Quesnay and the physiocrats generally, as well as those of Adam Smith and Rousseau, underlying their optimism on the one hand, and the doctrine of *laissez-faire* on the other. See also Lassalle's *Bastiat. Schulze von Delitzsch.*]

HARMONIES OF INDUSTRIES. See HARMONIES OF ECONOMICS.

HARMONISTS. See COMMUNISM.

HARRINGTON, JAMES (1611-1677), an eminent political writer, was the son of Sir Sapcote Harrington of Exton, in Rutlandshire. He studied at Oxford under Chillingworth, and then spent some years on the continent. He was greatly impressed by the flourishing condition of Holland, admiring its commerce, its social developments, and its political liberty. It was here he began his studies in political economy and government; and he was frequently heard to say that, "before he left England, he knew no more of anarchy, monarchy, aristocracy, democracy, oligarchy, or the like, than as hard words whose signification he found in his dictionary." Although a republican by conviction, Harrington was appointed in 1646 one of the personal attendants of Charles I. That unfortunate monarch delighted in his company, finding him to be very ingenious. "They had often discourses concerning government; but when they happened to talk of a commonwealth, the King seemed not to endure it" (Wood's *Athenæ Oxonienses*). Harrington became strongly attached to the king, and accompanied him to the scaffold. His execution affected him so much that he retired to his library and his literary pursuits. But to convince his friends that his grief was personal and not political, he produced his *Oceana*. This celebrated work—half romance, half treatise—on political philosophy, was written for the purpose of setting forth the best form of government for a commonwealth. The author's elaboration of his ideal republic was something in the same style as Sir Thomas More's *Utopia*. Harrington's idea was that government should be established upon an equal agrarian basis, rising into the superstructure of three orders—the senate debating and proposing, the people resolving, and the magistracy executing by an equal rotation through the suffrage of the people. The chief political doctrines inculcated in the work are these: the real basis of power is property, especially landed property; accordingly landed property should be distributed and held in such a way that no one person should derive from it more than a fixed amount of revenue; the rulers of the commonwealth should be changed every three years, their successors being elected by ballot. The *Oceana* was published in 1656, and excited much controversy. England figured as Oceana, Scotland as Marpesia, Ireland as Panopæa, Henry VII. as Panurgus, Henry VIII. as Coraunus, Queen Elizabeth as Parthenia, Cromwell as Megaletor, etc. The work was dedicated to Cromwell, who read it, but characteristically declared that "what he had won by the sword, he would not suffer himself to be scribbled out of."

Harrington not only endeavoured to propagate his republican opinions by writing, but with the same object formed a society of gentlemen called the Rota, who met at Miles's coffee-house, Westminster, and indulged in able and brilliant discussions concerning government and the ordering of the commonwealth. They had a ballot-box, and this being a novel form of voting in England, it attracted great attention. The society continued to meet until General Monk paved the way for the return of Charles II. After the restoration, Harrington lived more privately, but he was still regarded as a dangerous person, who maintained and propagated principles which could never be reconciled with monarchical government. He employed himself now in reducing his politics into short and easy aphorisms methodically digested, and freely communicated his views to all who visited him. While engaged in completing his system, he was arrested at the close of 1661, and committed to the Tower of London for treasonable designs

and practices. He suffered a long and severe imprisonment, in the course of which he lost his reason. In his latter years he wrote severely against the Stuarts, especially condemning Charles I., whom he had once strongly admired, for his consummate and obstinate tyranny. He also wrote various essays and papers in defence of his great work. His writings were edited by Toland in 1700, and the *Oceana* was partly reprinted as recently as 1887. Harrington died of palsy at Westminster.

[Chalmers's *Biographical Dictionary*.—Toland's *Life and Works of James Harrington*, 1700.—Birch's edition, 1737.—*Oceana*, as reprinted by Henry Morley, 1887.—Bonar's *Philosophy and Pol. Econ.*, 1893.] G. B. S.

HARRIS, Joseph (1702-1764), said to have begun life as a blacksmith at Talgarth, in Breconshire, his native place, was appointed assay master of the mint in 1748. Besides several works on navigation, trigonometry, optics, and astronomy, he wrote an *Essay on Money and Coins*, in two parts, published in 1757 and 1758. He introduced the first part by an enlightened statement of some leading principles of political economy, still worth reading; he dwelt particularly on the relation of the minimum standard of subsistence to the cost of production; and he treated the whole subject of money and of foreign exchanges with singular clearness both of view and of style. He was perfectly free from the mercantile theory of wealth, and not very far from free-trade principles. His monometallism was pronounced, and he doubted whether the existing silver standard could be exchanged for a gold standard. The second part is a vigorous demonstration of the evils which must follow any debasement of the coinage, with an historical account of the variations in the standard before his time.

[*Dict. of National Biography*.—R. Williams, *Dict. of Eminent Welshmen*.—See also references in M'Culloch, *Literature of Political Economy*, and in Jevons's article on Cantillon, *Contemp. Review*, January 1881]. E. G. P.

HARRISON, William (1534-1593), clerk in holy orders, is a writer of economic importance through the inclusion in his *Description of England* of many valuable details as to the economic condition of Elizabethan England. Thus he acquaints us with the fact that wine was a home product at that time. In part ii. of the above work he urges that the action of the merchants in procuring the prohibition of foreign bottoms has led to a rise in prices. As this was part of the popular navigation policy, his attack on it shows considerable independence of thought.

In addition to the above work, Harrison left two MSS., one dealing with contemporary weights and measures (1587), the other a chronology.

[Ashley, *Economic History*, vol. i. pt. ii.] E. C. K. G.

HARTE, Rev. Walter (1709-1774), a friend of Pope, travelling tutor to Lord Chesterfield's son, and vicar of St. Austell and St. Blazey in Cornwall, 1750. Besides miscellaneous essays and poems and an unsuccessful history of Gustavus Adolphus, he wrote two *Essays on Husbandry*, 1764, the first on agriculture in general, the second on the cultivation of lucerne. The former, a literary eulogy of agriculture as the basis and support of all flourishing communities, is rambling and wholly unscientific in its treatment of the subject, but enterprising and suggestive of many foreign, even American and Asiatic, plants and methods which might be introduced into England.

[Chalmers's *Biog. Dict.*; the dates in this account may be corrected by Foster's *Alumni Oxonienses*, 1715-1886.—*Dict. of National Biography*.—*Gent. Mag.* 1774.] E. G. P.

HARTLIB, Samuel (fl. 1630-1660), the friend of Milton and Sir W. Petty, published or edited, sometimes with additions of his own, many valuable works on agriculture and kindred subjects. Amongst these may be mentioned, 1. *A Discourse of Husbandrie used in Brabant and Flanders*, etc. (by Sir Richard Weston), London, 1650, 4to, 2nd ed.; corrected and enlarged, London, 4to, 1652. When the first edition was published, Hartlib did not know the name of the author. 2. *An Invention of Engines in motion*, etc. (by Cressy Dymock), London, 4to, 1651; Reprinted, with a biography of Dymock, in Dirck's *Memoir of Hartlib*. 3. *An Essay for the advancement of husbandry learning; or propositions for the erecting a College of Husbandry; and in order thereunto for the taking in of pupils or apprentices. And also friends or fellowes of the same Colledge or Society*. 4. *The Reformed Husbandman; or a brief Treatise of the errors, defects, and inconveniences of our English Husbandry*, etc., London, 4to, 1651. 5. *Samuel Hartlib, his Legacie; or an Enlargement of the Discourse of Husbandry used in Brabant and Flanders*, etc., London, 4to, 1651. This work consists of Hartlib's address, Sir Richard Weston's "legacy" to his sons, and "a large letter" to Hartlib (by Cressy Dymock or Robert Child). The third edition (1655) is a much larger work, and has the title *Samuel Hartlib, his Legacy of Husbandry. Wherein are bequeathed to the commonwealth of England, not only Brabant and Flanders, but also many more outlandish and domestick experiments and secrets (of Gabriel Plats and others)*. 6. *A designe for Plentie, by an universall planting of Fruit-trees*, etc., London, 4to, 1652. Hartlib did not know the author of this work, which was given to a friend of his by Colonel John Barkstead. 7. *A discoverie for division or setting out of land as to the best form*, etc., 1653. This consists mainly of a letter from Cressy Dymock. 8. *The Compleat Husbandman; or*

a discourse of the whole art of Husbandry, both Forraign and Domestick, etc. Unto which is added, A particular discourse of the Naturall History and Husbandry of Ireland. Two parts, London, 4to, 1659. The second part consists of an appendix to the "Legacie," with the date 1652. 9. *An Essay upon Master W. Potter's Designe; concerning a Bank of Lands to be erected throughout this commonwealth*, etc., London (*n. d.*) 8vo.

[For an account of Hartlib's life and other publications, see *Dictionary of National Biography.*] W. A. S. H.

HASSIA, Henricus de. See Langenstein.

HAWKINS, Edward (1780-1867), numismatist and antiquarian, was born at Macclesfield, and educated partly at the grammar school there, partly by private tuition. After being in the Macclesfield bank for a time, he entered into partnership with his father in a bank at Swansea, and together they managed the copper works at Neath Abbey (*Dict. Nat. Biog.*). In 1806 he was elected fellow of the Linnean, in 1821 fellow of the Royal Society, in 1826 fellow of the Society of Antiquaries, and president in 1850 of the Numismatic Society. In 1825 he acted as deputy for Taylor Combe, keeper of antiquities and coins in the British Museum; upon his death in 1826, Hawkins was appointed to the post, which he occupied until 1861 (*Stat. and Rules of Brit. Mus.*, pp. 41, 43; *Medallic Illustrations*, i. vi.). From an early age he had devoted much attention to the study of coins, and amassed a very complete series of English medals, while his collection of English political caricatures was the finest known. Both collections were purchased by the trustees of the British Museum—the medals in 1860, and the prints in 1868 (*Medallic Illustr.*, i. vi.).

Hawkins's most important contributions to numismatic literature, in addition to valuable papers published in the *Transactions* of the Numismatic Society and the Society of Antiquaries, are (1) *The Silver Coins of England* (1841). This, with necessary alterations and additions, has since been edited by his grandson, R. D. Kenyon (1876, 1887), and remains the standard work on the subject. (2) He also collected materials for a work on medals. It was intended to issue this as a Museum publication, but when the portion completed to the close of the reign of William III., was printed and submitted to the trustees in 1852, they declined to pass it, in consequence of the expression of certain political opinions which they considered undesirable in a government publication (*Hansard*, 3rd July 1854; *Medall. Illustr.*, i. vi.). After some years the historical notes were, with Hawkins's sanction, revised by his successor, W. S. Vaux, and by Sir A. W. Franks. Further matter, which resulted from inspection of various foreign collections unvisited by Hawkins, led to certain modifications of opinion, and to the addition of many fresh illustrations. The work, brought down to the death of George II., was eventually edited by Sir A. W. Franks (now keeper of Brit. and Med. Antiquities); and by H. A. Grueber (now assistant keeper of coins and medals), as a Museum publication in 1885, under the title of *Medallic Illustrations of the History of Great Britain and Ireland.* (3) *Description of Anglo-Gallic Coins in Brit. Mus.*, begun by Taylor Combe, was completed by Hawkins (1826). In addition to these, Hawkins completed Combe's work in *Description of Ancient Marbles in Brit. Mus.*, v. (1826), and edited parts vii., x. (1839, 1842, 1845). His many valuable memoranda on his collection of prints were purchased by the Museum, and incorporated, after revision, in the *Catalogue of Prints and Drawings in Brit. Mus.*, iii. pt. i. prepared by F. G. Stephens (1877). For the Chetham Society, Hawkins edited *Sir W. Brereton's Travels* (1844), and *The Holy Lyfe and History of Seynt Werburge* (1848).

[See Ward, T. H., *Men of the Reign*, 1885.—*Proc. of Antiq. Soc.*, 23rd April 1868.—*Numismatic Chronicle, N.S.*, vii. (1867).—*Athenæum*, 15th June 1867.—Introductions to the various works already mentioned.] E. A. M.

HAWKINS, Sir John (1719-89). The son of a carpenter, who was afterwards a surveyor, Hawkins was originally brought up to his father's trade, but abandoned it in favour of the law, and became an attorney. He married a Miss Storer, who brought him a large dowry which enabled him to retire from business; and he became chairman of the Middlesex justices. He was knighted in 1772, in recognition of his services in suppressing the election riots at Brentford in 1768, and the Moorfield riots in 1769. His experience of the bad condition of the roads led him to publish his *Observations on the State of the Highways, and on the Laws for amending them and keeping them in Repair* (Lond., 1763), subjoining to them the draft of a bill consolidating former acts for the maintenance of the highways. The act based on this was so skilfully drawn that for many years it did not require amendment. The treatise takes up the history of various acts of parliament on this head, and shows how they had fallen into disuse, with some remarks on the practical difficulty of legally enforcing the acts in many cases. Hawkins's observations do not apply to turnpike roads, which were in good condition. He also expatiates on the fact that the rich paid proportionately far less than the poor towards the maintenance of the highways. Hawkins had given much attention to music, and also published a *Life and Works of Dr. Johnson* (Lond., 1787), with whom he had been intimate. Boswell, in his *Life of Johnson*, is consistently unjust to Hawkins, who, however, appears to have been a somewhat coarse man. He was buried in Westminster Abbey.

[Chalmers, *Biographical Dictionary* (from information supplied by the family), Lond., 1812-1817.—Boswell, *Life of Johnson*, edited by J. W.

Croker, Lond., 1848.—Sir G. Grove, *Dictionary of Music*, Lond., 1879-88.] R. H. H.

HAYES, JOHN L. (1813-1887), born in Maine; died in Cambridge, Mass. For the last twenty-five years of his life he was actively identified with the tariff discussions in the United States, particularly defending protective duties in favour of the woollen interests. In 1865 he became secretary of the National Association of Wool Manufacturers, and edited their quarterly publication. He was president of the tariff commission of 1882, and was largely responsible for the report of that body. His writings were voluminous, and for the most part may be found in the several volumes of the *Bulletin* referred to, which is exceedingly valuable as reflecting the protectionist sentiment of the period.

Among his pamphlets may be mentioned *The Fleece and the Loom*, 1866.—*Wools of the United States*, 1872.—*Sheep Industry in the South*, 1878.—*The Farmers' Question*, 1880; and various writings on Reciprocity. See "Memoir" by G. B. Stebbins in *Bulletin of Wool Manufacturers*, vol. xviii. p. 97. D. R. D.

*HAYNE, SAMUEL (fl. 1660-1697), surveyor of customs, was born probably in Devonshire in 1645. For seven years he was clerk assistant to Joseph Ash, collector of the customs of Plymouth and Cornwall. He then became an "adventurer at sea"; during the Dutch war of 1672, was employed in the prize office and the admiralty; engaged afterwards in the trade with France; and in 1680 was appointed riding surveyor of the customs and surveyor for the Navigation Act in Devon and Cornwall.

Hayne published: 1. *An abstract of all the statutes made concerning aliens trading in England. . . . Also, of all the laws made for securing our plantation trade to ourselves, with observations thereon, proving that the Jews (in their practical way of trade at this time) break them all, to the great damage of the king in his customs, etc. . . . Together with the hardships and difficulties the author hath already met with, in his endeavouring to find out and detect the ways and methods they take to effect it*, London, 4to, 1685. 2. *The manifesto of near one hundred and fifty Knights, . . . Merchants and citizens of London, against the Jews now in England. . . .*, London, 1697, fol. W. A. S. H.

HAYNES, CHRISTOPHER (fl. 1713), merchant, was apparently engaged in the trade with Spain. During the controversy on the 8th and 9th clauses of the treaty of Utrecht (1713) he contributed "many useful pieces" on that subject to the *British Merchant* (see KING, CHARLES). W. A. S. H.

HAYNES, JOHN (fl. 1706-1715), wool factor, published: 1. *A view of the present state of the clothing trade in England, with remarks on the causes of . . . its decay, and a scheme of proper remedies for the recovery of it*, etc., London, 1706, 8vo. 2. *Great Britain's glory, or an account of the great number of poor employed in the woollen and silk manufacturies; . . . with the reasons of the decay of these trades*, etc., London, 1715, 8vo. (The latter is little more than a new edition of the former; it is apparently cited by M'Culloch (*Literature of Political Economy*, p. 237), as *Provision for the Poor*.) 3. *Proposals for the more effectual preventing the exportation of wool* (*n. d.*). He proposed the prohibition of water-carriage of wool, the registration of all wool produced in the country, prosecutions for infringement of the statutes dealing with the wool trade by special commissions appointed for that purpose, and other measures which he thought would prevent the exportation of wool. He is probably identical with the "John Haines" who addressed a memorial to the government in 1702, asking to be appointed "general supervisor" in Hampshire and Dorset for the prevention of the exportation of wool. His request was refused on the ground that the commissioners of customs could not advise the appointment of such an officer, or recommend a person "who had received the censure of the House of Commons on his knees."

[*Treasury Papers*, lxxxii. 26.] W. A. S. H.

HAXTHAUSEN, AUGUST FRANZ, Freiherr von (1792-1866), was born at Bökendorf in Westphalia. From 1808 to 1813 he studied at the school of mining at Clausthal. He served for some time as a volunteer in the Hanoverian army, and then went to the university of Göttingen to study law. He was there associated with a circle interested in art and poetry, from which proceeded a periodical to which Arnim, Brentano, and the brothers Grimm were contributors; and occupied himself much in the collection of German popular songs and sagas. In 1819 he returned to his native place, and devoted himself during several years to an earnest study of the agrarian condition of North Germany. He published, in 1829, the results of his researches in relation to the principalities of Paderborn and Corvey. This work attracted the notice of the then crown prince, afterwards King Frederick William IV.; the author was invited to Berlin, and was entrusted with the mission of examining in the respective localities the agrarian systems of the several Prussian provinces, and communicating the results of his inquiries to the ministry. To give him the necessary influence with the provincial officials, he was made a privy councillor. He travelled for nine years through the Prussian dominions, and collected ample materials for the great work which was projected. He published, however, only one volume, which dealt with the provinces of East and West Prussia (1839). A second volume, relating to Pomerania, was published twenty-two years later by A Padberg (1861); this branch of the subject had been partially handled by Haxthausen in a brief treatise on the formerly Slavic districts of

Germany (1842). An article of his in a German periodical on the Russian ukase of 1842 regulating the contracts between the landlords and peasants in that country, attracted much attention; it was reprinted by the *Allgemeine Zeitung*, the *Débats*, and the *Times*, who all interpreted the signature A. v. H. as being that of Alexander von Humboldt. This article led to Haxthausen's appointment by the Emperor Nicholas to conduct investigations in his dominions similar to those on which he had been employed in Prussia. He travelled extensively in Russia during 1843-44, the king of Prussia continuing his salary during his absence, and so making him independent of the Russian authorities. The fruit of his inquiries appeared in the following publications: —*Studien über die inneren Zustände, das Volksleben, und insbesondere die ländlichen Einrichtungen Russlands* (3 vols. 1847-1852), also published in French with the title *Études sur la situation intérieure, la vie nationale, et les institutions de la Russie* (1848-1853). An English translation by Robert Faris was published in 1856, with the title of *The Russian Empire—Transcaucasia:* this was an account of the family and communal life, and social condition of certain populations between the Black and Caspian Seas (1856); an English translation, by John Edward Taylor, appeared in 1854, before the German original was published. There appeared besides in English, by the same translator, as a kind of supplement to the foregoing, *The Tribes of the Caucasus, with an account of Schamyl and the Murids* (1855). We have also from Haxthausen's pen the following: *De l'abolition par voie législative du partage égal et temporaire des terres dans les communes russes* (1858); and *Die ländliche Verfassung Russlands, ihre Entwickelung und Feststellung in der Gesetzgebung von 1861* (1866).

Haxthausen was a member of the United Diet in 1847, and also for a short time a member of the first Prussian chamber. The practical objects which Haxthausen had in view in his treatment of the agrarian condition of North Germany, were the liberation of the soil from the power of capital, and the reform of the constitution of the provincial estates (*Ständische Verfassung*). Roscher regards him as one of the best of the group of conservative writers who at this period treated German economical questions, and who, both as owners of landed property and as state functionaries, understood many things better than the abstract liberal economists. He considers him, in particular, to have thrown new light on the question of the village communities of the middle ages. The same eminent critic speaks highly of his power of accurate observation, as evidenced by his Russian investigations; but remarks that he shows the usual "pseudo-historical" weakness of reactionaries in recommending the maintenance by the Russians of their *Feldgemeinschaft*, even after the abolition of serfdom, thus confounding the transitory peculiarity of a particular stage of culture with a permanent trait of the national character.

[Lippert in the *Handwörterbuch der Staatswissenschaften*, edited by Conrad and others (vol. iv. 1892).—Reifferscheid in the *Allgemeine Deutsche Biographie* (vol. xi. 1880).—Roscher, *Geschichte der N. O.*, p. 1027.] J. K. I.

HEARN, William Edward (1826-1888), born in the county of Cavan, and educated at Trinity College, Dublin, was, after having been professor of Greek at Queen's College, Galway, from 1849 to 1854, appointed in the latter year professor of political economy and other subjects at the university of Melbourne. Later he became a member of the legislative council of Victoria, and took an active part in the affairs of the colony up to his death.

Hearn's principal contribution to economics, the happily-named *Plutology* (1st ed. 1864, 2nd, 1878), is a model of the style which may be called classical. Like Hermann or Ricardo, Hearn holds an intermediate course between the highest abstractions and mere information; neither soaring to mathematical analysis, nor creeping among historical details. As one among many specimens of this method, the chapter on exchange (*Plutology*, ch. xiv.) may be referred to, presenting as it does all the relations of price to utility and cost of production, except those which can hardly be expressed without mathematics. So the chapter on the circumstances which determine the extent of capital may seem to fall short of perfection only by the want of a more quantitatively exact analysis of the influence of Distance in Time (*q.v.*) on value. It is justly said by Prof. Marshall: "Hearn's *Plutology* . . . is at once simple and profound: it affords an admirable example of the way in which detailed analysis may be applied to afford a training of a very high order for the young, and to give them an intelligent acquaintance with the economic conditions of life, without forcing upon them any particular solution of those more difficult problems on which they are not yet able to form an independent judgment." Among other high testimonies to the excellence of this work may be cited Jevons's reference, in the "Concluding remarks" of his *Theory*, to "Professor Hearn's views." Hearn wrote several other works, cited below, relating to social science, and was also a frequent contributor to the local press of Melbourne.

The Cassell Prize Essay on the Condition of Ireland, 1851 [In three chapters: (1) investigates the causes of the existing evils; (2) estimates the industrial resources of Ireland; (3) proposes remedies for such distress,—mostly simple legal reforms.]

The Aryan Household, its Structure and its Development: an Introduction to Comparative Jurisprudence, 1879.—*The Government of England, its Structure and its Development*, 1887.

F. Y. E.

HEARTH-MONEY OR HEARTH-TAX. The earliest such tax in England, "a fumage, or tax of smoke farthings," was levied in Anglo-Saxon times, probably as a customary payment to the king from all hearths but those of the poor.

In 1662 a tax of 2s. was levied on every hearth or stone in all dwelling-houses, except those of the poor who were exempt from church-rate and poor-rate, or fulfilled certain other conditions. In 1689, though the tax produced £170,000 a year, it was repealed on account of its unpopularity: it reached a poorer class than the old subsidies which it had superseded; it was farmed; and the inquisitorial visits of the inspectors, or "chimneymen," were deeply resented (see HALIFAX, EARL OF).

[Dowell's *Hist. of Taxation and Taxes in England*, vols. i., ii., iii.] E. G. P.

HEATHFIELD, RICHARD (c. 1775-1859), accountant. He proposed a tax of 15 per cent on all property, to pay off the national debt, and endeavoured to explain the advantages which would accrue from this proceeding The same expedient had been suggested by A. HUTCHESON in 1717, when the debt was only some £50,000,000. The suggestion derives its chief importance from having had the approval of RICARDO, and from having been proposed in parliament by General Palmer in 1832. Heathfield also wrote other tracts embodying the same proposals.

Elements of a Plan for the Liquidation of the Public Debt of the United Kingdom (Lond., 1819), and *Further Observations on the Practicability and Expediency of liquidating the Public Debt of the United Kingdom, including some Considerations on Population and the Poor* (Lond., 1820).

R. H. H.

HEDGMINT. A word used by Malynes, the existence of which sets before us the frequent manufacture of false money by persons in authority (see POLLARDS and CROCKARDS). "If any Hedgmint (for so doe the States of the Vnited Provinces of the Netherlands call the Mints of pettie Lords, which by falsified standards do imitate to coyne the money of other Princes)" . . .

[Malynes, *Lex Mercatoria*, 1622, p. 489.]

HEDONISM. This term, derived from the Greek *hédoné* (ἡδονή)=pleasure, is used to describe that philosophy which makes the attainment of pleasure and the avoidance of pain the supreme end of action,—in other words, defines virtue to be that course of conduct which produces the largest sum of happiness. Hedonism is thus the same as epicureanism in the proper sense of that term. Utilitarianism is hedonism modified by the substitution of the happiness of mankind for the happiness of the individual as the aim of virtuous conduct. Political economy has no necessary connection with either the selfish or the unselfish form of hedonism. Since, however, the one or the other has been very widely accepted in the 18th and 19th centuries, it is natural that many eminent economists should have been hedonists in their moral theories. See MORALITY, SYSTEMS OF, IN RELATION TO POLITICAL ECONOMY and the writers there referred to. F. C. M.

HEEREN, ARNOLD HERMANN LUDWIG (1760-1842), studied in the university of Göttingen, where he became in 1787 professor of philosophy, and in 1801, of history. As an author, he remained several years uncertain whether to devote himself to philosophy or history; his first publications were editions of the *De Encomiis* of the rhetorician Menander, and the *Eclogae physicae et ethicae* of Stobæus. His most important contributions to historical studies have been collected in his *Historische Werke* (15 vols. Göttingen, 1821-26), among which ought to be mentioned here vol. vii., *Handbuch der Geschichte des Alterthums mit besonderer Rücksicht auf Verfassungen, Handel und Colonien*, and vols. viii. and ix.; *Handbuch der Geschichte des Europäischen Staatensystems und seiner Colonien*. But the work which from the moment of its appearance conferred celebrity on his name (vols. x. to xv. of the *Historische Werke*), and which has been translated into most European languages after having been recast in successive editions, is the *Ideen über die Politik, Verkehr und Handel der vornehmsten Völker der alten Welt*.

Heeren himself explains his object in the Preface (*Vorrede*): "I write neither a history of ancient nations, nor a general history of political systems and trade. . . . My plan is limited, excepting preliminary general views, to isolated pictures of various nations (p. iv. 2nd ed. 1805). I have no hypothesis to found, no favourite tenets to demonstrate, no opponent to overthrow. . . . I state what I have found as I found it; what is certain as certain; what is probable as simply probable" (p. vi.).

Heeren may be considered as one of the earliest opponents to what has been called *Manchesterthum* in Germany. He writes in his chapter *Ueber Griechische Staatswirthschaft*: "Perhaps the Greeks were not fully aware of the importance of the division of labour, but they were free from the modern school philosophy which would gladly transform nations into mere wealth-producing herds. They felt, of course, that to live, man must produce; still it never struck them that man only lives to produce (vol. iii. p. 272). . . . Every high and divine feeling must be trampled down before there is room for such theories as degrade Socrates and Christ to the unproductive (*stérile*) class (p. 274). . . . It is possible to live happily in Otaheit

without regard to the system of Adam Smith" (p. 322).

Nevertheless he had accepted some of the teaching of the new school, especially respecting mercantilism: "Their aim (the Greeks') was not to keep the stock of minted coins inviolate, or to increase it; nothing was heard about the balance of trade, and the resulting high-handed (*gewaltsame*) regulations. They paid taxes, but without the modern object of directing industrial activity by means of the exclusion of this or that class of goods. The export of raw material was not prohibited, manufactures were not favoured at the expense of agriculture. In this sense, industry, commerce, and trade were free" (p. 283).

Heeren's history is perhaps deficient from the standpoint of modern minute criticism of texts, but its fluent and elegant style, its clear statement of facts, and judicial honesty in controversy, account for its former popularity. It has been translated into most European languages (into French in 1830-34, 6 vols. 8vo, and into English: *Historical Researches into the Politics, Intercourse, and Trade of the Principal Nations of Antiquity*, 3 vols. 8vo, Oxford, 1833). [See Notice in M'Culloch's *Literature of Pol. Econ.*, 1845, p. 151.] E. Ca.

HEGEL, G. W. F. (1770-1831), was educated at the Stuttgart gymnasium and Tübingen university. After some years' private tutorship in Switzerland and Frankfurt, and studious leisure in Jena, he became professor in Jena, 1805; for eight years rector of Nürnberg gymnasium, 1808-1816; professor at Heidelberg, 1816; and then at Berlin, 1818, where he remained till his death.

Hegel's leading characteristics are (*a*) his notion of development, and (*b*) his bold and thorough application of it to every phase of life and being. Development is to him a progress through conflict of opposites. Like Heraclitus, he finds that change is the essence of things; and his resemblance to the philosopher of Ephesus is undoubted, however fallacious it may be to find, with Lassalle, an almost complete Hegelian system in the sayings of the ancient philosopher. He finds that not only in our thoughts but in the nature of things, there is a constant process from one extreme to another, and then to a reconciling third, which in its turn becomes an extreme, and finds its own opposite, to be conquered by it and then to lie down with it within the fold of a new third reconciler, the fate of which is in due course the same. But the change is not simply flux and destruction; it is true development. Each third stage is more concrete than the last; each third stage contains in it all that has gone before. Hegel finds this notion most clearly realised in life, and especially in the most concrete forms of human life. Instead of treating law and morality as separate and separable, he finds these notions to be abstract and false when separated, and to be true and concrete only when viewed together in the family, civil society, and state. Civil society, more particularly, is the domain of what the older economists called "natural liberty," where there is pursuit of private gain obeying laws of which the private persons are unconscious. So far Hegel vindicates to political economy its claim to a realm of its own, civil society. But the limits of it at once appear. Civil society, as it itself grew out of the family, must itself pass into the state, where there is a conscious union of regard for rights with regard for duties, and the public good is deliberately sought. The development of civil society into the state, a development which, in Hegel as in Aristotle, is to be taken logically, not historically, takes place through associations, commercial, professional, and otherwise. Finally the state itself is not an ultimate end; states are individual members of larger groups, and all groups are members of the one humanity. The progress of the human race from generation to generation and age to age is the subject of the philosophy of history; and there is the same relentless process there as in the case of the single society. As Dr. Weryho well expresses it, *mors immortalis* is taken for the law of life.

This idea of development, as a *mors immortalis*, was retained by the Hegelians Marx, Engels, and Lassalle, when they created the new German socialism. They retained little else, for it became an axiom with them that all that is, is material; and spirit, that was to Hegel not only the roof and crown of things but the very essence of all things, was disowned altogether.

Their materialistic view of history marks a further alteration. Not only is there, to them, no spirit in Hegel's sense; but there is no progress except by changes in economic facts. The state of human societies as regards wealth—and especially the means and modes of producing wealth—is held to determine their condition in respect of all other features, hitherto supposed to be independent. Law, religion, and political institutions are thus supposed to be due to economical causes. This view, recently expounded by Professor Loria with even fewer reservations than by the Germans, would need a separate discussion. It receives no support from Hegel, and cannot be traced to his influence.

Hegel's influence, in fact, on political economy has been much less profound and direct than on philosophy. In no part of his voluminous writings does he give much space to economic discussion; and the keen interest shown by his contemporary Fichte in the condition of the people is absent in Hegel. Yet he deserves mention in the history of political economy, for it was a group of his disciples

that first fairly planted the philosophical idea of development in the soil of economics. The Young Hegelians, Marx, Engels, Ruge, taught at Paris, in the *Deutsch-Französische Jahrbücher* (1844), a revolutionary socialism founded on a notion of development derived from Hegel's, though confessedly unlike its parent in many important particulars. Proudhon's attempt to apply Hegelian formulas more literally, in the same direction, was not so skilful, as the controversy between Proudhon and Marx (1846-47) brought out very clearly. No doubt the connection between Hegel's principles and the application of them by this group of his followers did not become closer; German socialism soon became more economic than philosophical. But the attraction possessed by such a book as Hegel's *Philosophy of Right* for such men as Engels and Marx is a significant fact both for philosophers and economists. (See also LASSALLE; MARX; PROUDHON; RUGE).

Hegel's Works were edited by Marheineke, Schulze, Gans, Hotho, Michelet, Förster, Rosenkranz in 18 vols. (1832-40), to which is to be added a 19th vol. (1887), edited by his son Karl Hegel, and containing his correspondence.

[His Life by Rosenkranz was published in 1844. The *Philosophy of Right* is vol. 8 of Works. A summary is given in Bonar's *Philosophy and Political Economy* (1893), bk. iv., ch. iv., "Hegel." Another account, professedly from unpublished MSS. of Hegel, is given by Dr. Georg Mollat, *System der Sittlichkeit von Hegel* (Osterwieck), 1893, and Dr. Mollat has also published Hegel's *Essay on the German Constitution* (1893). For the relation of Marx to Hegel see Bonar *loc. cit.*, and also Barth's *Geschichtsphilosophie Hegels* (Leipzig, 1890), and L. Weryho's *Marx als Philosoph* (Bern and Leipzig, 1894). For the relation of Lassalle to Hegel, see especially Lassalle's *Die Philosophie Heracleitos des Dunkeln*, etc. (1858), and his *Erworbene Rechte* (1861).] J. B.

HEIR. In popular language this expression is generally used for any one who inherits, sometimes also, more especially in the plural form, in the sense of next of kin. The etymological equivalents of the word in the continental languages (*héritier*, *erede*, *Erbe*, etc.) are generally used in the sense of the Latin word "heres," which designated a person who by reason of his parentage or of a testamentary appointment became the universal successor of a deceased person, and whilst taking over all the predecessor's property, was personally liable for his debts and legacies (unless he had taken advantage of the BENEFICIUM INVENTARII) (*q.v.*). In English technical language the word "heir-at-law" is used for the person to whom freehold property descends in case of INTESTACY (*q.v.*); in the case of copyhold property the designation is "customary heir." The words "and his heirs," when added to the name of a person to whom land is conveyed in fee simple, indicate that he is to take an "estate of inheritance" and not a mere life estate, but they do not in any way prevent him from dealing with the property to the exclusion of his heir-at-law; the words "and the heirs *of his body*," on the other hand, indicate an estate tail (see ENTAIL, LAW OF). E. S.

HEIRLOOMS. In the correct use of the term heirlooms are those chattels which by the custom of particular places are attached to an estate of inheritance in land. They are not devisable by will but always descend with the estate. The term is, however, often used to denote chattels that are annexed to an estate of inheritance by the common law or by the terms of a will or settlement.

[Goodeve on *Real Property*, London, 4th ed. 1897.] J. E. C. M.

HELD, ADOLF VON (1844-1880), a distinguished economist, was born at Würzburg, where his father, Dr. Joseph von Held, was professor of jurisprudence. He pursued the study of political science at his native place, at Munich, and at Berlin. In 1872 he was appointed professor at Bonn, and in 1880 at Berlin; and in the same year his career, which had so far been one of brilliant promise, was cut short by his death from accidental drowning in the lake of Thun. He had been secretary, and an active member, of the *Verein für Sozialpolitik*. His first publication was *Carey's Socialwissenschaft und das Mercantilsystem*, 1866. Roscher praises his article on Adam Smith in Hildebrand's *Jahrb.*, 1867, as containing one of the most unprejudiced and altogether excellent appreciations of the great Scotchman anywhere produced.

The principal writings of Held were *Die Einkommensteuer*, 1872.—*Die deutsche Arbeiterpresse der Gegenwart*, 1873.—*Sozialismus, Sozialdemokratie und Sozialpolitik*, 1877 (which may be described as a manifesto of the principles and policy of the *Kathedersozialisten*); and *Grundriss für Vorlesungen über National-Oekonomie* (2nd edit. 1878).—He left behind him in MS. *Zwei Bücher zur sozialen Geschichte Englands*, a portion of a great work, for which he had prepared himself by studies in London during June, July, and August 1875. This highly interesting fragment was edited in 1881 by G. F. Knapp.

[Roscher, *Gesch. der N.O.*, p. 1045.—Lippert in the *Handw. der Staatswissenschaften*.] J. K. I.

Held, though one of the earliest supporters of the *Verein für Sozialpolitik*, founded 1872, and himself a moderate state-socialist, could not refrain from a gibe at "socialists of the chair." Their very name, he said, implied that to become like Bebel and Liebknecht they only wanted courage (see the account of the *Verein* by Prof. Philippovich, *Quart. Journ. of Econ.*, January 1891, p. 228). His *Sociale Geschichte Englands* was certainly one of the causes of the revival in England itself of the study of the history of English industry and the study of the surroundings in which the classical

economists produced their works. The first part, containing the industrial and literary history of the fifty-six years from the *Wealth of Nations* to the Reform Bill is of more permanent value than the second which treats of the earlier history of English industry and the growth of modern manufacture. But even in the latter he calls attention to many sources of evidence, especially blue-books, on the condition of the labouring classes, that had been too long neglected by our own countrymen.

In his estimates of writers, statesmen, and popular leaders he is sometimes misled by his bias against Classical Economics, but he has an evident desire to be truthful, and we have always to remember that his book appeared without his final revision.

His theoretical principles were stated in two papers especially. First in his *Rede über die Sociale Frage, gehalten auf der freien kirchlichen Versammlung evangelischer Männer in der Garnisons-Kirche zu Berlin 12ten Oktober 1871* (reprinted, Wiegand, Berlin, 1872). He rejects the abstract method of the classical economists, their undue emphasis on self-interest, their negative view of the state as a mere policeman, their way of opposing self-help and state-help. He admits that we have learned from the socialists to pay due attention to the distribution of wealth. He approves of progressive taxation and interference with the right of bequest.

In his second paper *Ueber den gegenwärtigen Principienstreit in der Nationalökonomie, Preuss. Jahrb., Juli 1872*, he addresses not a popular but a learned audience. He goes a little way into economic history, but deals chiefly with questions of the day. We have, he says, to deal with a new phenomenon—the rise of a school of *Kathedersozialisten* in opposition to *Manchesterthum*, in that very year 1872. Individualism pure and simple has, Held says, no answer to Marx; and *Kathedersozialismus* is the only safeguard against the "red spectre."

It may be remarked that in this paper as elsewhere Held regards MARX as the teacher and LASSALLE as only the pupil. J. B.

HELFERICH, JOHANNES A RENATUS VON (1818-1892), was a pupil of F. B. HERMANN, whom he succeeded in the chair of political economy at Munich. Helferich shares with D. G. Mayr the honour of having re-edited Hermann's *Staatswirthschaftliche Untersuchungen*. Helferich was for some forty years one of the editors of the *Tübinger Zeitschrift*, to which from time to time he contributed articles on a variety of subjects; such as the "Unity of German Currency" (1850), "Sugar-duties" (1852), "The Austrian paper currency" (1855-67), "Éloge of Hermann" (1878). Helferich's principal work on the *Periodic Oscillations of the Precious Metals since the discovery of America to the year 1830* is remarkable on account of its polemic against the Quantity Theory of currency, which the author regards as "*durchaus unrichtig*." The quantity is but one among the circumstances of supply and demand which govern the value of gold. This value, when once established, is preserved by a certain *vis inertiæ* (p. 38). "The price of goods is dependent on their own value-determination" (*von der eigenen Werthbestimmung abhängig*). The price of goods determines rather than is determined by the quantity of gold (a *sub finem* statement which may perhaps be compared with that made by Mr. Giffen in the *Nineteenth Century* for Nov. 1889). True to his principles, Helferich regards the rise in prices in the period from the discovery of America to 1550 as in the main not due to the influx of gold. He has to admit, indeed, that at a subsequent period quantity is a dominant factor. He made a good use of the historical material available when he wrote. His remarks on the method of measuring the value of money may be read with advantage (see MONEY).

Von den periodischen Schwankungen im Werth der edeln Metalle, von der Entdeckung Amerikas bis zum Jahr 1830. Nürnberg, 1843.—*Zeitschrift für die gesammte Staatswissenschaft*, Tübingen, *passim.* Articles on Taxation, and 'Forstwirthschaft' in Schönberg's *Handbuch.* F. Y. E.

HELLER. By the provisions of a law passed in August 1892, a gold crown of a hundred hellers has been adopted as the standard of value for Austria-Hungary. This crown, which is money of account, being equal to ·0417 of a pound sterling (or ten pence), the heller is of the value of one tenth of a penny. The coin bearing the name heller is a bronze piece weighing 1·6 grammes. There is also a 2-heller piece in bronze, and 10 and 20 heller pieces made of pure nickel.

Formerly in South Germany four hellers were equal to a kreutzer, and 60 kreutzers to a gulden. F. E. A.

HELVETIUS (1715-1771), the son of the first physician of the queen of France; owed to this high protection the post of farmer-general at the early age of twenty-three. He resigned in 1751, and devoted himself to literary pursuits; his house had always been a centre of the polite and philosophic society of the time. His principal books are the treatises *De l'Esprit* (1758) and *De l'Homme, de ses facultés intellectuelles et de son éducation* (1776), which was published after his death, and in which he endeavoured to explain the parts of his first book which, after a previous period of brilliant popularity, had given offence in the philosophic circles of Paris.

The main position of Helvetius may be summed up as follows: man is a purely sentient animal only differing from other animals by a higher degree of physical sentiency.[1] Human

[1] For the use of this word see Herbert Spencer. "Once more let me emphasise the truth that since a society in its corporate capacity is not *sentient*, and since the sentiency dwells exclusively in its units, the sole reason for subordinating the sentient lives of its units to the unsentient life of the society, is that, etc." (Herbert Spencer, *Justice*, ch. xxix. § 187, ch. entitled, "The Limits of State Duties Concluded").

passions are nothing else but the various modes of manifestation of this physical sentiency, which is the only motor of human actions; pleasure or pain are their unavoidable results: to pursue the former and to evade the latter is to conform to the only natural law. "He is a virtuous man whose strongest passion is so connected with the general good that for him virtue is in almost every case a matter of necessity." Hence our passions must be, not constrained, but educated: education and consequently legislation are all-powerful, since all men are born with the same physical constitution. To previous bad education and legislation are due the prevailing vices and excessive inequality in the distribution of wealth. Helvetius is thus in some respects a forerunner of modern utilitarianism and hedonism. "This man," Madame du Deffand used to say, "has told everybody's secret."

[See reference to Helvetius in Dugald Stewart, *Lectures on Pol. Econ.*, ed. 1856, vol. ii. p. 390; and in Rae, *Life of Adam Smith*, p. 200.]

E. Ca.

HENLEY, Walter of (c. 1200-1250). The only internal evidence which the treatise of *Husbandry* affords regarding its author is the incidental statement that he had served the office of bailiff. The title of a Cambridge MS. (Univ. Lib. Dd., vii. 6) gives the additional information that he was a knight and subsequently became a Dominican. It appears probable that he flourished in the time of Henry III., and wrote the interesting tract on estate management and the practice of farming which bears his name. It was the best known of several treatises on this subject which were written in England at this time, in Norman French: they are a remarkable group, more especially as there does not seem to be any corresponding literature of the kind at this date in other parts of Christendom. Transcribers were sometimes guilty of making curious confusions among, and rearrangements of these books, but they have been separated out, and translated by Miss Lamond, as Walter of Henley's *Husbandry*, *Seneschaucie*, an anonymous *Husbandry*, and Grosseteste's *Rules*. Walter of Henley's treatise survives in a large number of MSS.,—besides the twenty-one examples enumerated in the Introduction to Royal Historical Society edition, there is a copy in Corpus Library at Cambridge. The book was evidently much used as a handbook, and it was found in many monastic libraries. Several copies of it were made at Christ Church, Canterbury, and one, of a somewhat different text, at St. Augustine's. It held its own as the standard treatise on agriculture till the 16th century, when it was superseded by the work of Sir A. Fitzherbert, who treated similar topics, but — despite the commonly expressed opinion to the contrary — in all probability independently. The treatise renders many points of mediæval agriculture clear, *e.g.* the relative expense of cultivation on the Three Field and Two Field system; the practical hints which it gives, are a great assistance to any one who is anxious to get a clear understanding of the tillage of former days. W. C.

HENRY OF GHENT. See Ghent, Henry of.

HERBERT, Claude-Jacques (1700-1758), farmer-general of the royal mail coaches, mentioned by Adam Smith as a "very faithful, diligent, and laborious collector" of the prices of corn, has sometimes been credited as being the first in date of the advocates of free trade in corn in France. He himself lays no claim to such priority, and in his anonymous *Essai sur la police des grains* (London 1754, Berlin 1755, the London edition is incomplete), he expressly states that the same views had been entertained so far back as 1695 by Boisguillebert in his *Détail de la France*, and, closer to his own time, in 1748 in a *Mémoire sur les Bleds* (*vide* Dupin). Herbert belongs to the physiocratic school ("All the goods we possess flow from the cultivation of land," p. 2, Berlin edition). His main argument is that free trade in corn will develop the growing of corn. "It is not the obstinate storing of our corn, but its successive and annual production which will feed us. . . . Cultivation is the inexhaustible stock of our supply" (pp. 104 and 105). He rejects, as leading to jobbery, the system of "permissions to export and the erection of store-houses, either by government or by companies." Opposed to import duties, he admits a sort of sliding scale of export duties, which will be "a sufficient counterpoise to keep corn within the kingdom in case of need" (p. 192).

Barbier (*Dict. des Anonymes*) ascribes also to Herbert the authorship of a pamphlet of sixty pages, *Observations sur la Liberté du Commerce des Grains*, which was published the year after his death. The internal evidence renders this rather doubtful. E. Ca.

HEREDITAMENT. An expression used in legal documents for any real property whether consisting of land, buildings, or rights attaching to land (*e.g.* advowsons, rights of common, etc.) The latter are called "incorporeal" hereditaments. E. S.

HEREDITAS, the entire property of a deceased person, to which his universal successor or *heres* succeeded, whether under a will or *ab intestato*. The *heres*, as successor to the deceased, was liable for his debts. E. A. W.

HEREDITY. The persistence of the same character through many generations of a family or a people is a fact often observed and of the utmost importance for economics. The persistence of a peculiar artistic faculty has preserved to some cities, *e.g.* to Lyons, the supremacy in certain manufactures, which, so far as external

conditions are concerned, might have flourished equally well in many other places. The persistence of financial skill has made the Jews everywhere the bankers of hostile races and creeds. Persistent energy has made Holland and Lancashire rich; persistent idleness has made Naples and Andalusia poor. The principal causes of this permanence of character are not hard to find. They appear to be four—blood, education, civilisation, and natural environment. As to the first, only physical science can attempt to determine the extent to which physical peculiarities—above all, peculiarities of the brain and the nervous system, are transmitted from one generation to another. Even now there is no agreement among experts as to the mode or extent of such transmission. That it does take place somehow or other few men of common sense will doubt. But it is not only in giving the child a certain physical constitution that the parents' influence on its character and intelligence are so momentous. Education in that larger sense which includes the modelling of feelings, habits, and occupations has always been, and must continue to be, for the most part the work of the father and mother. Although the formal division of castes is unknown in Europe, most occupations are to a great extent hereditary. The child imitates the parent. The parent finds it easier to train his child to his own calling than to any other. To the child the parent imparts much useful knowledge which could not be learnt at school, and many habitual aptitudes indispensable for success in any calling. It thus becomes impossible to compute how much of the child's resemblance to the parent is due to strictly physical causes, how much to subsequent educational influence. Again it is not merely parentage or education, but also inherited civilisation, which contributes to mould the individual on the pattern of his ancestors. An old and deep-rooted civilisation exercises the most penetrating power on all who come within its sphere, whether by birth or by immigration, whether as conquerors or as subjects. Thus successive races of invaders have been permeated by the civilisation of Italy and China, and the older types of thought have endured in spite of infusions of alien blood. Lastly, the effect of natural environment, the conditions of soil, scenery, and above all, climate, tend to maintain physical and moral uniformity through age after age, and favour the illusion that the present inhabitants of a given country are all lineal descendants of those who inhabited it in the earliest period of history. These natural agencies have no doubt contributed much to the assimilation of foreign conquerors by the conquered natives. The joint influence of a peculiar climate and a peculiar civilisation in rendering men subjected to their action like one another and unlike everybody else is well illustrated in the United States of America. The mixed crowd of European immigrants who disembark every year on the shores of the United States are rapidly transformed into the likeness of the older settlers, and their offspring can hardly be distinguished from the offspring of three or four generations of American citizens. But the pure-blooded Yankee who is proud of his descent from the Puritans is a very different man from his English ancestor or cousin. The converse truth is illustrated by the remarkable transformation which many races have undergone when removed to a new home and exposed to new influences. Thus the Jews in their own country were mainly an agricultural and pastoral people; since their dispersion they have lived chiefly in towns and have busied themselves in trading and money-lending. It thus appears that the continuity of national character is the result in varying proportions of unbroken descent by blood, of education, of inherited civilisation, and of unchanged natural conditions. The relative potency of these agencies in any given instance may be roughly conjectured, but can never be exactly determined. Such determination is not, however, necessary for economic purposes. It is enough for economical investigation to know that tribes and nations have certain striking characteristics which may indeed be modified in the long lapse of time or by violent revolutions, but which are in the main permanent. It should, however, be remembered that this permanence is not the same in every stage of civilisation. It is most conspicuous in the earlier, the tribal or at most the national stage. It is less conspicuous in the later, the cosmopolitan stage. Thus in the ancient world the hereditary peculiarities of the Greek and the Jew, the Phœnician and the Roman, the Gaul and the Egyptian, were all strongly marked, whilst they retained their independence, but became somewhat blurred when they were merged in one universal empire. At the present day the different nations of Europe impart to each other their arts, their discoveries, their inventions, their luxuries, and their vices. Each people learns something from its neighbours and abates something of its own peculiarities. But this process of assimilation is in great measure superficial, and leaves the hereditary distinctions of temperament and character almost unchanged.

Poulton, *Theories of Heredity.*—Weissmann, *Essays upon Heredity and Kindred Biological Subjects.*—Kindere, *De la Race et de sa part d'influence dans les diverses manifestations de l'activité des peuples.*—Ribot, *Heredity, a Psychological Study of its Phenomena, Laws, Causes, and Consequences.*—J. B. Haycraft, *Darwinism and Race Progress* (1895).] F. C. M.

HERIOT. When a gesith or thegn received a grant of BOCLAND (*q.v.*) it was customary for

the lord to make him a gift of arms and equipment. On the thegn's death this gift was repaid in whole or part from his chattels by the heir, and this repayment, at first customary and then compulsory, is called the heriot. The Norman lawyers confused the heriot with the feudal relief, which was paid by the heir on succeeding to his father's lands. But the two things are perfectly distinct. The relief is directly connected with the tenure of land; until it is paid the estate returns to the overlord, who only grants possession to the heir when the customary payment has been paid. But the heriot has no connection with the land, which passes unconditionally to the heir. It is in fact not so much a charge upon the heir as a payment from the dead man to his lord.

[Stubbs, *Constitutional History*, i. 261.] R. L.

Heriot still survives as a manorial right subsisting on copyhold land in many parts of England, and also in certain places, more particularly in Kent, on freehold land held of a manor. It consists in the right of the lord, on the death of a tenant, and in some cases also on alienation, to seize the best beast, *e.g.* a valuable race-horse, on every tenement held by such tenants. On some manors the best chattel, *e.g.* a diamond necklace, may be taken by the lord. It is frequently difficult to ascertain whether land is subject to heriots or not, as the occasions for making use of the right may only occur at long intervals; and, as the statute of limitations, though it could bar a particular exercise of the right of heriot, could not bar the general right (see Zouche *v.* Dalbiac, L. R. 10 Ex. 172), a continuous non-exercise of the right would, however, tend to extinguish it. The compulsory extinguishment of heriots may, under § 7 of the Copyhold Act 1887, be claimed either by the lord or the tenant, and the compensation payable to the lord is, in such a case, ascertained in the same way as in the case of the enfranchisement of copyhold land.

Heriots, though a picturesque reminder of a past age, have nothing in their favour from an economical point of view. They cause an inconvenience to the tenant out of proportion to the advantage they confer on the lord; their real or assumed existence frequently creates difficulties on the sale of land, and, in many instances, they have caused fruitless and expensive litigation. It would be most desirable for the legislature to fix a period within which compensation for them and similar manorial rights might be claimed by the lords, and to declare that after the lapse of such period all such rights should cease.

[As to the present law relating to heriots, see Elton, *Copyholds*, 2nd edition, 198-210.] E. S.

HERITABLE AND MOVEABLE (Scots Law). Correspond very nearly, with some exceptions, such as teinds or tithes, liferents or estates for life in land, mortgage debts, and others, to real and personal as applied to property in English law, particularly with reference to the respective rights of the heir and the personal representative. In Scots law there are, however, more numerous instances than in English in which property is considered heritable (or real) for one purpose and moveable (or personal) for others: and there are some leading differences of principle, such as that rights in their own nature moveable, but having a tract (or prospective course) of future time, as for example, leases, annuities, and life interests in money, are heritable, and not moveable or personal only.

[For enumerations of heritable and moveable rights, see Bell's *Commentaries*, vol. ii. p. 1, *et seq.*] A. D.

HERITABLE SECURITIES (Scots Law). A generic term, including all forms of real securities, or securities on land or buildings. The most ordinary form in use is a bond and disposition in security, a combination of a personal bond with a redeemable conveyance or mortgage, with power of sale by public auction and of granting an absolute title upon such sale.

[See Craigie's *Digest of Scottish Conveyancing* (*Heritable*).] A. D.

HERMANN, Friedrich Benedict Wilhelm (1795-1868), one of the most eminent of German economists and statisticians, was born at Dinkelsbühl in Bavaria. He studied at Erlangen and Würzburg. He was afterwards (1821) teacher of mathematics at Erlangen, and (1825) professor of that science in the Polytechnic school of Nuremberg. In 1827 he was appointed extraordinary professor of technology and political economy in the university of Munich. His great work, *Staatswirthschaftliche Untersuchungen* (1832), made his reputation, and procured for him the position of ordinary professor in his university. He was employed by the government as inspector of institutions for technical instruction, and was commissioned to visit, in 1839, the Paris exhibition, of which he published an account (*Die Industrie-Ausstellung zu Paris*). He was also appointed a member of the statistical bureau, and in the capacity of its head he issued, from 1850 to 1867, his contributions to the statistics of Bavaria. He filled from time to time different important posts in the ministries of the interior and of finance. At several conferences of representatives of the German states on taxation, he worked earnestly for the creation of one national system of customs duties. He organised a *Grossdeutsche Partei*, whose motto was "Kein Deutschland ohne Oesterreich." He held that a union without Austria would produce not a lesser Germany, but a larger Prussia. He represented in 1848 the city of Munich in the National Assembly at Frankfort, and voted as a member of the Left Centre. In 1855 he retired from political life, and devoted himself to

his professorial duties and to scientific research. He was seized with inflammation of the lungs on 20th November 1868, and, aware of his approaching end, dictated to his son, as long as his strength permitted, the alterations to be introduced into a new edition of his *Untersuchungen*. He died on the 23rd of the same month.

[Roscher, *Gesch. der N.O.*, p. 860.—Cossa, *Introd. to the study of P.E.*, English trans., Macmillan, 1893, p. 406.—Kautz, *Nationalökonomie*, ii. p. 633.] J. K. I.

Hermann in his *Staatswirthschaftliche Untersuchungen* (Munich, 1832, and, enlarged afterwards from his notes, 1870) has left one of the most permanently valuable books on economics in the German language. It covers nearly the whole ground of a text-book, and such a text-book as might have been expected a generation later. Like Schäffle, he says much at the outset on human wants, the notion of "goods," and other psychological aspects of his subject. He lays stress on the distinction of technical from economical, the first relating to the production of certain physical effects by the use of certain physical causes, the second to the disposal of quantities of goods, on the principle of greatest benefit at least sacrifice. He distinguishes the economy of an individual, of a family, and of a larger group. He points out that joint action is not necessarily collective action; a school may be started by the joint action of several fathers for the training of their own several children, but it is not a public or collective institution unless it is created by a union of citizens not specially for themselves but for the general advantage (ed. 1870, p. 95).

His illustrations from education are frequent. As a public man, he took a keen interest in public instruction. He draws also in many other ways on his special knowledge of public affairs in Prussia, and especially in Bavaria. The later edition refers in this connection to his report for the Zollverein's commission on the London Exhibition of 1851 (ed. 1870, p. 214, cp. 426, 466-467). In theory, he is a shrewd and close reasoner. He expressly adopts the abstract method (120, 168, cp. 378). He works out mainly on conservative lines the theory of value, price, demand, etc. He thinks income of consumers is the true wages-fund. He has a wide knowledge even of the minor English and American economists (*e.g.* 203, 259, 266). Some of his distinctions are not perhaps very happy. For example *Nutz-capital*, as distinguished from *Productiv-capital* (221 *seq.*), is on the whole a metaphor, and not to be embraced with the latter under one definition of capital. The distinction, again, of *Hilfstoff* from *Hauptstoff* (320) seems rather technical than economical. But, open him where you will, you find mature wisdom and clear reasoning.

Banfield, in his *Organization of Industry* (1845), acknowledges his debt to Hermann (*e.g.* Preface and pp. 20, 28). But Banfield, who had studied Rau, Von Thünen, and List, had special opportunities in his own travels, official and unofficial, of knowing the Germans. Hermann had little further notice, till Professor Marshall, in his *Principles* (1890), made him full amends for previous English neglect (see esp. p. 106 n., 492, etc.) [see also Banfield; German School]. J. B.

HERRENSCHWAND (—). This writer on political economy has often been mistaken for his brother Johann Friedrich, a Swiss physician, who died in Bern in 1796. He is believed to have been a judge in the Swiss regiments in the French service, and according to the *Nouvelle Biographie Générale* (vol. 24, p. 463) was in 1805 an old man living in Paris. Nothing else is known about him.

He is a turgid and diffuse writer, always professing to set forth the will of the "Creator," or of the "Universe." Blanqui in the bibliography annexed to his *Histoire de l'Économie Politique* (ii. p. 350, ed. 1860) mentions him as a connecting link between Quesnay and Smith. In common with the former, Herrenschwand has a general predilection for agriculture and a state of equilibrium between production and consumption; and in common with the second, he remarks on the beneficial influence of high wages, but his opinions on the evils of foreign trade, and on the usefulness of the accumulation of the precious metals, are quite contrary to their views. His favourite remedy is the multiplication of absolutely independent consumers (*consommateurs indépendants par excellence*), and the increase in their hands of coined precious metals (*Du vrai Gouvernement des Peuples de la Terre*, London and Paris, 1801-1802, p. 89).

His works, although written in French, were published in London; *De l'Économie Politique Moderne. Discours fondamental sur la Population* (London, 1786, and Paris, 1795).—*Discours sur le Crédit Public des Nations de l'Europe* (1786).—*Discours sur la Division des Terres* (1788).—*De l'Économie Politique et Morale de l'Espèce Humaine* (2 vols., 1786).—*Du vrai Principe actif de l'Économie Politique* (1797). Arthur Young, *Travels through France* (2nd ed. vol. i. p. 481), writing on his own studies and those of Sir James Stuart, on the subject of "Population," refers thus to Herrenschwand; "other writers have arisen who have viewed the subject in its right light; and of these none have equalled Mons. Herenschwandt, who in his *Économie Politique Moderne*, 1786; and his *Discours sur la Division des Terres*, 1788, has almost exhausted the subject." E. Ca.

HERRERA, Cristobal Perez de (end of 16th and early 17th century), physician of the royal navy of Spain and of Philip II., wrote several works on the poor, among which may be mentioned his several *Discursos del Amparo de los legítimos Pobres* (Discourses on the Pro-

tection of the well-conducted Poor), Madrid, 1595, 1598, and 1608. He recommends the erection of special houses (*Albergues*), which are to be supported by the church, the municipal authorities, and private charity; but unlike his predecessor GIGINTA (*q.v.*), he does not in his *Replica* (Reply) to the objections opposed to his discourses, appear to be willing to enforce work on the well-conducted poor, and only considers it as a mode of correction for vagrants and women of bad character; he would even allow the well-conducted poor, whilst inmates of the house, to go out begging on their own account.

More favourable to Herrera's endeavours than to Giginta's, King Philip III. in 1596, ordered, his plan to be executed in fifty towns and rural places; but owing probably to the absence of the test of work suggested by Giginta, its effects were rather favourable to than restrictive of the extension of pauperism.

HERRIES, JOHN CHARLES (1778-1855), statesman and financier, was the son of a London merchant. In 1798 he entered the public service as junior clerk in the treasury, but was soon promoted to a place in the revenue department, where he so distinguished himself that Pitt employed him to draw up his counter-resolutions against Tierney's financial proposals. He further received the thanks of the prime minister in 1803 for his pamphlet in reply to the financial strictures of Cobbett and Lord Grenville. Herries acted for some time as secretary to Vansittart, and afterwards to Spencer Perceval, and in 1811 he was despatched to Ireland to assist Wellesley-Pole, the Irish chancellor of the exchequer. The same year he was appointed to the arduous office of commissary-in-chief, in which post he did much to cope with the jobbery everywhere prevalent. He had now a great reputation as a political economist, and in 1813, in conjunction with Nathan Meyer Rothschild, he succeeded in carrying out a plan for the collection of French specie for the use of Wellington's army. But owing to the continued dearth of specie in 1815, a large number of 20-franc pieces were, at Herries's suggestion, coined at the mint for the use of the army. The office of commissary-in-chief having been abolished in 1816, Herries retired on a pension; but he was soon appointed to the new office of auditor of the civil list. In 1821 he was appointed one of the commissioners for inquiring into the collection and management of the revenue in Ireland. He was named financial secretary to the treasury in 1823, being returned to parliament during the same year for Harwich. It was under his direction that the consolidation of the customs laws was effected. When Lord Goderich (Earl of Ripon), became prime minister on the death of Canning, Herries was appointed chancellor of the exchequer at the king's special request. Ministerial complications ensued, the result of which was that Herries left the exchequer and became master of the mint. He served on the finance committee of 1828, and was the first financier to "make the public accounts intelligible." In 1830 he became president of the board of trade, but resigned both his offices when Lord Grey acceded to office. In the session of 1832 Herries made a severe and damaging attack upon the government in connection with the Russian-Dutch loan. He was secretary at war in Peel's ministry of 1834-35. Appointed in 1838 one of the committee on metropolitan improvements, he drew up the greater portion of its second report. He strongly attacked the financial and commercial policy of the Whig government in 1841, but the same year lost his seat in the house. Having retired from Harwich at the dissolution, he unsuccessfully contested Ipswich. He now remained out of parliament for six years. Returned in 1847 for Stamford in the protectionist interest, he strongly opposed the repeal of the navigation laws. In the Derby ministry of 1852 he held the office of president of the board of control, but that ministry was overthrown in December (1852), and in the ensuing year Herries retired altogether from parliamentary life. Herries was not a great statesman or a brilliant speaker, but he acquired the reputation of an able financier and an assiduous public servant.

[E. Herries, *Memoir of the Public Life of J. C. Herries.*—Bulwer, *Life of Lord Palmerston.*—Walpole, *History of England.*—*Annual Register*, 1855.—Art. "Herries, J. C.," *Dictionary of National Biography.*

Herries has recently been appealed to by Mr. W. H. Smith, Mr. Gladstone, and Sir. W. Harcourt, as an authority upon the probability of panic in the event of bimetallism. Mr. Arthur Balfour expressed a very different view of his abilities. "Speech at Bimetallic Conference," London, 1895.] G. B. S.

HEUSCHLING, PHILIPP F. XAVIER THEODORE (1802-1883). An eminent official of the ministry of the interior in Brussels, was a frequent contributor on statistical subjects to the *Journal des Économistes.*—*La Belgique Judiciaire,*—*Revue de l'Administration et du Droit Administratif en Belgique.*—*Bulletin de la Commission de Statistique de Belgique*, etc.

The list of his publications extends over three pages of the Belgian *Bibliographie Nationale* (Brussels, 2 vols. 1888). Among them ought to be mentioned: *Essai sur la Statistique générale de la Belgique* (1838).—*Bibliographie historique de la Statistique en Allemagne* (1845).—*Manuel de Statistique ethnographique universelle* (1847).—*Le Congrès Général de Statistique tenu à Bruxelles en 1853* (Paris, 1853).—*Résumé de la Statistique*

Générale de Belgique de 1841 à 1850 (1853).—*L'Empire de Turquie* (1860). He wrote in conjunction with M. Block: *Das Kaiserthum Frankreich und das Königreich Belgien* (Leipzig, 1871), and collected under the title of *L'Impôt sur le Revenu* (1873), several of his scattered pamphlets and review articles advocating an income tax to take the place of indirect taxation and license duties (*patentes*). He assisted QUETELET (*q.v.*) in the publication of the *Comptes Rendus des Travaux de la Commission Centrale de Statistique*, and Bivort in bringing out the *Annales Législatives de la Belgique*, and trans. *Princ. of Stat.* of B. HILDEBRAND (*q.v.*). E. Ca.

HEYSHAM, JOHN, M.D. Edin. (1753-1834), is best known through his statistical observations, extending from 1779 to 1787, on the bills of mortality at Carlisle, in which town he followed his profession of physician. His tables include the number of deaths according to age, sex, and conjugal condition, and are accompanied by general observations on the vital statistics of Carlisle, including some remarks, with statistical illustrations, concerning the value of inoculating for smallpox. His figures formed the basis of Joshua Milne's *Carlisle Life Table*, which from its greater accuracy very generally superseded the Northampton table previously used, though the mortality at Carlisle was somewhat lower than that of England. Heysham took a census of the town in 1780 and in 1788, and calls attention to the large increase in the number of the inhabitants, due to manufactories.

An abridgment of *Observations on the Bills of Mortality in Carlisle 1779-87*, Carlisle, 1797.—*An Account of the Jail Fever at Carlisle in 1781*. Lond., 1782.

[Dr. H. Lonsdale, *Life of John Heysham, M.D.*, Lond., 1870.—Concerning the Carlisle Table, see also Joshua Milne, *Treatise on the Valuation of Annuities*, 2 vols., Lond., 1815, and C. Walford, *Insurance Cyclopædia*, s.v. *Carlisle Table of Mortality*, Lond., 1871.] R. H. H.

HIDAGE. The earliest tax in English history, the DANEGELD (*q.v.*), was a tax of a varying number of shillings on the hide of land. The original reason for this imposition was to buy off the Danish invasions under Ethelred II. But long after this pretext had disappeared, even after the Norman Conquest, the danegeld continued to be levied from time to time under the same name. But after 1163 it disappears from the rolls, and historians have often supposed that it was never again levied. But precisely the same charge on land continues to be made by Henry II. and Richard I. under the name of hidage, and in the 13th century as carucage. Hidage therefore is really the same as danegeld, though it only appears as a technical term after the latter had fallen into disuse. R. L.

HIDE. In the original distribution of land among the English settlers in Britain the portion allotted to each free man, *i.e.* the homestead with a share in the arable and pasture lands of the township (see ALOD), was called a hide. From this use came its later meaning as a measure of area. By the laws of Edward the Elder a ceorl who had fully five hides of land with other qualifications could become a thegn. But it is impossible to determine the measurement denoted by a hide in Anglo-Saxon times, and it is certain that this varied very much in different localities. After the Norman Conquest a hide means the same as a carucate, *i.e.* the land that can be ploughed by a single team. This, originally a varying area, is fixed in the twelfth century at 100 or 120 acres.

[Kemble, *Saxons in England*, i. 88.—*Dialogus de Scaccario*, i. 17.—E. W. Robertson, *Historical Essays*.—Stubbs, *Constitutional History*, i. 74.] R. L.

The *hide* or *higid* appears to have meant, in primitive times, the amount of land which sufficed for a family; it consisted of arable land with pasture rights, and has been generally regarded as the share allotted to each free warrior (ALOD). Charters quoted by Mr. Round seem to prove that the hide was an area of 120 acres.

In Domesday Book the term is used as a unit of assessment for purposes of calculating the Danegeld. Like the term *carucato* (properly 160 or 180 acres, see CARUCAGE) it ceases, in this great record, to be a direct measure of area; for a large expanse of barren heath, and a comparatively small but fertile arable holding, might each be rated as a hide. The principle of *beneficial hidation*, or the favourable rating of certain estates or districts (as *e.g.* the archiepiscopal land in Surrey) was so far operative that it is quite impossible to deduce the area of an estate from the Domesday hides.

HIGGLING of the market is described by Adam Smith as a process by which "exchangeable value" is adjusted to its measure "quantity of labour."

"It is often difficult to ascertain the proportion between two different quantities of labour . . . it is not easy to find any accurate measure either of hardship or ingenuity. In exchanging, indeed, the different productions of different sorts of labour for one another, some allowance is commonly made for both. It is adjusted, however, not by any accurate measure, but by the higgling and bargaining of the market, according to that rough equality which, though not exact, is sufficient for carrying on the business of common life" (*Wealth of Nations*, bk. i. ch. v.).

Compare FLEEMING JENKIN: "The higgling of the market, ascertaining the result of the relative demand and supply in that market, does not in the long run determine the price of either eggs or tea; it simply finds out the price which had

been already determined by quite different means" ("Time-Labour System," *Papers, Literary, Scientific*, etc., p. 139). It is possible to accept the writer's account of the *market process* (*Ibid.* p. 123) without contrasting so strongly the determination of price by demand and supply and by cost of production (cp. Prof. Marshall, *Principles*, Preface, p. xi.). Prof. Marshall at the beginning, when treating of the theory of the equilibrium of demand and supply, gives an excellent type of the action of a market (*Ibid.* bk. v. § 2). See also his note on barter at the end of the chapter referred to, and his mathematical note xii. The subject can hardly be apprehended without mathematical conceptions. Thus Mill, in his description of the play of demand and supply (*Pol. Econ.*, bk. iii. ch. ii. § 4), in the absence of the idea of a demand-curve or function, may seem to use the phrases "demand increases," "demand diminishes," loosely. A more distinct idea is thus expressed by Fleeming Jenkin in his *Graphic Representations*. "If every man were openly to write down beforehand exactly what he would sell or buy at each price, the market price might be computed immediately." A similar idea is presented by Prof. Walras (*Éléments d'Économie Pure*, art. 50). In some later passages he has formulated the higgling of the market more elaborately. The present writer, criticising these passages (*Revue d'Économie politique*, Jan. 1891), has maintained that even if the dispositions of all the parties were known beforehand, there could be predicted only the position of equilibrium, not the particular course by which it is reached. Of course special observation may supply the defects of theory. For instance there may be evidence of the incident which Cantillon attributes to the "altercation" of a market, namely the predominant influence of a few buyers or sellers; "le prix réglé par quelques uns est ordinairement suivi par les autres" (*Essai*, part ii. ch. ii. Des prix des Marchés). Compare Condillac: "Aussitôt que quelques uns seront d'accord sur la proportion à suivre dans leurs échanges les autres prendront cette proportion pour règle" (*Le Commerce et le Gouvernement*, ch. iv. *Des marchés*).

"Higgling" is not always qualified as "of a market." The term may be used in much the same sense as the "art of bargaining" is used by Jevons, with reference to a transaction between two individuals, in the absence of competition (*Theory*, p. 124, 3rd ed.). Thus Professor Marshall, in an important passage relating to the case in which agents of production are held by two monopolists, says that there is "nothing but 'higgling and bargaining'" to settle the proportions in which a certain surplus will be divided between the two (*Principles of Economics*, bk. v. ch. x. end). Moses, in the *Vicar of Wakefield*, did not require a fair for the exercise of the skill which is thus attributed to him: "He always stands out and higgles and actually tires them till he gets a bargain." HIGHWAY RATES. See RATES.

HILDEBRAND, BRUNO (1812-1878), a German economist of the historical school who won an enviable reputation among his contemporaries by his scholarly contributions to the science, and especially by a rare administrative power that found its happiest expression in the establishment and editorial management of the *Jahrbücher für Nationalökonomie und Statistik*, was born at Naumburg, a small town on the Saale river, where his father was clerk of the court. In 1836 he began an academic career as privatdocent or lecturer in history at the university of Breslau. Like G. Kries and Carl Knies, however, he soon specialised in political economy. The instructorship developed three years later into an assistant professorship, and in 1841 Hildebrand was made full professor of political science at the university of Marburg. While in this position he represented Marburg in the Paulskirche Conference at Frankfort, and in 1849-50 he sat as representative for the city of Bockenheim in the Hessian parliament. It was in this latter body in September 1850 that Hildebrand moved and carried a motion to refuse the additional grants asked for by the government in the annual budget. A dissolution of the House followed and Hildebrand lost his position as professor at Marburg in consequence of his action. He then went to Switzerland and was made professor of political science, first at Zurich and then at Berne, where he founded the first cantonal statistical bureau. In 1861 he was called to the chair of political economy at the university of Jena, where he remained until his death. It was here that he started the publication of the *Jahrbücher*, which he edited alone until 1873, when Prof. Johann Conrad, a former pupil, became associate editor. Prof. Conrad succeeded to the chief editorship in 1878. In 1864 Hildebrand was made director of the statistical bureau of the United Thuringian States, in which position he published many valuable statistical researches. His chief work, however, was his book entitled "Political Economy of the present and future" *Die Nationalökonomie der Gegenwart und Zukunft*, the first volume of which appeared in 1848. Much material on the industrial condition of labour and manufactures, gathered during a long stay in England in 1846, was utilised in this work. He criticises the different schools from the historical point of view and treats the laws of economic development in modern times ethically and politically. Perhaps his best and severest criticisms are those of Engels, Proudhon, and the theoretical parts of Fried. List's doctrines, although Hildebrand was himself a moderate protectionist. In spite of the fact that this book was welcomed as an

important contribution to that stream of literature begun by the historical school, a second volume never appeared, possibly because of disinclination to go further on the same lines, but more probably because of absorption in more practical work.

Hildebrand was a man of great energy and organising power, with a good hold on practical life, and always successful in collecting economic facts from all classes of people. His practical activity occupied itself in the organisation of two small railways in Zurich and Bern, and of a short railway in the Saale valley starting from Jena. He also established several friendly societies in the towns in which he lived. As a university lecturer he was not particularly brilliant, in the form or contents of his lectures; he usually spoke without notes and in a somewhat disconnected manner, but he laid great stress upon personal work with his students, and his influence on them, especially by way of suggestion and supervision, was peculiarly successful. Criticism and the development of a critical spirit among his students was ever with him a hobby. His chief writings in the order of their appearance are as follows:

Xenophontis et Aristotelis de œconomia publica doctrinæ illustratæ, 2 Teile, Marburg, 1845.—*Die Nationalökonomie der Gegenwart und Zukunft*, I (einziger) Bd. Frankfort a. M. 1848.—*Statistische Mitteilungen über die volkswirthschaftlichen Zustände Kurhessens*, Berlin, 1853.—*Beiträge zur Statistik des Kantons Bern*. Bd. I. 1 Hälfte, Bern, 1860.—*Die Kurhessische Finanzverwaltung*, Kassel, 1860.—*Untersuchungen über die Bevölkerung des alten Italiens* (*Artikel im Neuen Schweizerischen Museum*, 1861.)—*De antiquissimæ agri romani distributionis fide*, Jena, 1862.—*Statistik Thüringens, Mitteilungen des statist. Bureaus Vereinigter Thüringischer Staaten*, 2 Bde, Jena, 1867-78.—*Principes de statistique administrative, enseignés à l'Université de Jéna. Traduit de l'allemand sur les cahiers du professeur et résumés par X. Heuschling*, Brussels and Paris, 1872. [This was an unauthorised translation of a college student's note book which appeared in the *Bulletin de la Commission centrale de statistique*, vol. xii.]

Many valuable articles upon various economic topics in his *Jahrbücher*. S. M'C. L.

HILDRETH, Richard (1807-1867), was born in Deerfield, Mass.; he became a lawyer and editor in Boston, and was the author of a standard history of the United States. He published many works on history and moral and political philosophy, among which is, *The History of Banks, to which is added a Demonstration of the Advantage and Necessity of free Competition in the Business of Banking*, Boston, 1837, pp. 142. Hildreth argued that bank-notes should be subject to the same kind of legislation as bills of exchange. D. R. D.

HILL, Sir Rowland (1795-1879), was the founder of penny postage in England. In 1819 he established Hazelwood School, near Birmingham, and in 1822 brought out, in conjunction with his brother, Matthew Davenport Hill, a treatise on public education. With the hope that the government might be induced to examine into the home colonies of Holland, which seemed to afford valuable suggestions for our own poor-law administration, he wrote a pamphlet on *Home Colonies* in 1832. In 1835 he was appointed secretary to the commissioners for the colonisation of South Australia, and in that capacity suggested a plan for municipal government which is believed to contain the first scheme ever put forward for proportional representation. In 1837 his pamphlet appeared on *Post Office Reform: its Importance and Practicability*, urging the substitution of a uniform charge—preferably the minimum then in use, one penny—for the complicated system of "rating" then practised. This led to considerable popular agitation, which induced the government to appoint a committee of enquiry in 1838, and to introduce a Penny Postage Bill in 1838, going into effect in 1840. To assist in carrying out the contemplated reforms, Hill was appointed in 1839 to a position in the Treasury. The term for which he was appointed having expired, he was dismissed by the new ministry in 1842; and thereupon turned his attention to railway management, as director and then chairman of the Brighton Company (1843-1846). In 1846 a national testimonial was presented to him in recognition of his services in postal reform, together with a subscription of £13,000. In the same year he was appointed to the newly-created office of secretary to the postmaster-general. In 1854 this office was combined in his person with the older office of secretary to the general post office; and he remained sole secretary till his resignation in 1864. He had been knighted in 1860; and on his retirement received a parliamentary grant of £20,000. He was buried in Westminster Abbey.

The principles of the modern postal service are so far-reaching that it may be well to state them in Rowland Hill's own words. His attention, he tells us in his autobiography, was first directed to the subject by his interest in the problems of taxation. He had come to the conclusion that the best tax was that whereof "the productiveness kept pace with the increasing number and prosperity of the nation." "This test brought the tax on the transmission of letters into bad pre-eminence, since during the previous twenty years the revenue derived from the post office . . . had even somewhat diminished." The suggestion, which he attributes to his father, Thomas Wright Hill, that "even for fiscal purposes postage was unwisely high," then occurred to him; and he "started" upon his work of investigation "with the simple notion that rates must be reduced." "The question to be decided therefore was, how far the total reduction might safely be carried; and this involved two preliminary in-

quiries ; first, what would be the probable increase of correspondence consequent upon such or such reduction ; secondly, what would be the augmentation of expense consequent upon such increase." As to the first he concluded from an observation of the cases of several commodities, not only that cheapening was followed by an increase in demand, but that "reduction in price, even if it does not increase the total expenditure on the article, seldom if ever permanently lowers its amount." As to the second, he saw that under the existing system many of the elements of expense "must increase in something like direct proportion to increase in the number of letters." But this he thought by no means necessary ; expense could be effectually reduced by simplicity of operation, and this could be obtained by "reducing the prodigious variety of rates, and adopting means to induce prepayment." "In considering how far the variety of rates might be reduced, I was led to inquire what proportion of postal expense proceeded from the conveyance of letters from town to town, and further how far such expense varied in relation to distance." "I found, first, that the cost of conveying a letter between post-town and post-town was exceedingly small ; secondly, that it had but little relation to distance ; and thirdly, that it depended much upon the number of letters conveyed by the particular mail ; and as the cost per letter would diminish with every increase in number, and such increase would certainly follow reduction of postage, it followed that, if a great reduction could be effected, the cost of conveyance per letter might be deemed absolutely insignificant. Hence I came to the conclusion that the practice of regulating the amount of postage by the distance over which a letter was conveyed . . . had no foundation in principle ; and that consequently the rates of postage should be irrespective of distance. This discovery, as startling to myself as it could be to any one else, was the basis of the plan which has made so great a change in postal affairs" [*The Life of Sir Rowland Hill and the History of Penny Postage*, by Sir Rowland Hill and his nephew G. B. Hill, 1880].

[Bastable, *Finance*, 1903, bk. ii. ch. iii. §§ 7, 8.]

W. J. A.

HILL-BURTON, JOHN, also known as BURTON, JOHN HILL (1809-1881), born at Aberdeen, was educated at Aberdeen university, and after trying in vain to practise at the Edinburgh bar, became a writer for the *Westminster* and *Edinburgh Review*. He helped Sir J. Bowring to edit Bentham's works. His first notable writing, if we except *Benthamiana*, 1843, is his *Life of Hume*, 1846, and *Letters of Eminent Persons to David Hume*, 1849. He edited the autobiography of Carlyle of Inveresk, 1860. His *Biographies of Lord Lovat and Duncan Forbes*, 1847, may be said to have given a foretaste of his *History of Scotland*, 1853, *seq.* which has the signal merits of being faithful to the sources, and thorough, candid, and judicial in the examination of them.

Hill-Burton's chief economical book is *Political and Social Economy, and its Practical Applications* (Chambers, Edinburgh, 1849). He addresses himself to a supposed need of "the acting and thinking man," to have the true political economy set before him as concretely and as attractively as the false, which was just then, through Louis Blanc and others, neglecting no means of making itself known. He had long hoped to write such a book, and on a larger scale than time now allowed him.

The book deals with applications and illustrations rather than first principles ; and it bears the marks of a time of transition. The writer stands midway between two epochs, and describes both, with no very distinct consciousness that the old political economy like the old régime is giving place to a new. He mentions Mill's *Principles*, 1848, with respect, but in a tone of disappointment (p. 42). He finds Mill's discussion of luxuries, for example, inadequate. On the other hand he himself states the WAGES FUND theory, without any misgivings (p. 54). His first section on production is largely a plea for piecework against time-work. He quotes Thiers against the French socialists on the rights of property (p. 60). His quotation of the remark that there must always be a worst-paid industry (p. 29), does not lead him to any innovations in theory. His allusions to current events, railways, colonies, pauperism, and epidemics, help to make his book at once readable and historically valuable, as enabling us to place ourselves at the point of view of an intelligent English citizen forty-five years ago.

Otherwise it is far inferior in interest to his historical works, and has little or nothing of the charm of his literary masterpiece, *The Book-Hunter*, 1860. It is perhaps not too much to say that he is of most service to economists when he is not writing directly on their subject.

Clear and wise as are the chapters of his *Emigrant's Guide*, 1851, they bear out this statement. Almost at starting he speaks of the colonists as to be "guided by the eternal laws of political economy, laws as eternal and beneficent as those of the mechanical powers and animal life, laws not easily found, often misconstrued, taxing men's intellects to the utmost, and far more liable than the laws of other sciences to the false direction of prejudice, yet existing in nature beyond doubt," *Em. G.* "Australia, etc.," part i. p. 7.

This is use and wont, and largely obsolete use and wont. There is more character in the description of those who should and those who should not emigrate, the contrasts of national character, the criticisms of Wakefield's plan of emigration (pp. 38 *seq.*), the sudden outburst against the tyranny of proprietors and capitalists (52), the proofs given of the necessity of the interference of the home government (73-88). The statistics of wages in the colonies, and the comments on slave compared with free labour, must also be mentioned (*Em. G.*, part ii.). "South Australia," etc. (pp. 8, 16, 25, 97, 136, 137, etc. America, p. 81, 182, 183).

But Hill-Burton is more at home in his *History of Scotland*, where his economical training often leads him to draw attention to incidents of which an ordinary historian would miss the significance.

Such are, for example, his notices in vol. ii. (2nd ed. 1873) of absentee landlords, and the effect, on

them, of an act forbidding exportation of goods or money from Scotland during war (1318), p. 306, in vol. iii. of the decreasing wealth of Scotland at the time of the Reformation, pp. 438, 448, of an early instance of a "consul" p. 438, of the currency at the end of the 15th cent., p. 441, of export duties yielding more than import, p. 448. There is no difficulty in adding to this list when we come to the later volumes. The economical element in the questions between England and Scotland when their union was discussed after James I.'s accession (vol. v. 404), and when it was arranged under Queen Anne (vol. viii. 121, 207, etc.), receives adequate though never prolix treatment.

The more laboured statement of the latter case in the special *History of Queen Anne* (1880 ed.) pp. 48 *seq.*, does not add much that is important, though there too the historian occasionally uses the eyes and the language of the economist. See esp. vol. iii. pp. 166 *seq.*, on scarcity of money in Ireland *circa* 1705, and iii. 312 on political economy as aided by statistics and "commercial book-keeping."

[*Life* by Mrs. Hill-Burton in *Book Hunter* (large paper ed. 1882).—Blackwood's *Magazine*, September 1881.—*Nat. Dict. of Biog.* (by Richard Garnett).] J. B.

HIRE is the name given to payments for the use of services or movable things other than money. In the usual economic division of income into rent of land, interest, and wages, net hire, like all other income derived from the possession of property other than land, comes under the head of interest. There is, however, an important characteristic in respect of which hire of things must be classed with rent. In the case of rent and hire, when the borrower returns the loan he returns the thing actually lent, while in the case of interest he only returns a similar thing, not the coins actually lent but similar coins. E. C.

HIRE AND PURCHASE AGREEMENTS. These agreements (of which the much-advertised purchases "on the three years hire system" are instances) are of interest to economists, as they represent a new form of credit, the application of which seems extending both in England and abroad. They are in reality purchasing agreements which stipulate the payment of the purchase price by instalments, but the purchase does not take effect until the last instalment has been paid, and in the meantime the instalments are dealt with as "rent for the hire and use" of the purchased articles. This enables the vendor to recover the goods in case of non-payment of any of the instalments without having had to go through the formality of registering a BILL OF SALE, and at the same time to retain the instalments previously paid. He is, however, exposed to the risk of the purchaser selling or pledging the goods to a third party who, if acting in good faith and without notice of the vendor's right, is entitled to treat the sale or pledge as valid (Factors Act 1889, § 2 and § 9; Lee *v.* Butler [1893] 2 Q. B. 318; Helby *v.* Matthews [1894] 2 Q. B. 262). There is something to be said in favour of these agreements, as they enable persons of small means to purchase sewing machines or other articles producing income or reducing expenditure, but on the other hand, as they impose no immediate great sacrifice on the purchaser and therefore appear to him much more favourable than they really are, they are frequently used for the purpose of disposing of unmarketable goods or of obtaining excessive prices. The forfeiture of the instalments paid before default also causes great hardship. The abuses of the purchase and hire system seem to be specially felt in Germany; an imperial act dealing with some of them was passed in 1894.

[For a complete analysis of hire and purchase and other similar transactions and full details as to their use in Germany, see Cohn, *Die volkswirtschaftliche Bedeutung des Abzahlungsgeschäfts.*] E. S.

HIRING. The contract of hiring (*locatio-conductio*) relates either to things or services. In the case of the hiring of things the hirer is entitled to the possession of the thing for the purpose stipulated, but acquires no property in it. In the case of the hiring of services, the worker is bound to render the service within the time agreed upon, exercising a proper degree of care and diligence on the work.

HISTORICAL METHOD. The historical method of economic study is commonly contrasted with the abstract and deductive methods. Such a contrast, however, is to some extent misleading. The study of economics might be concrete without being historical; and, on the other hand, the historical method may be to some extent deductive. The distinctive feature of the historical method is its recognition of *development* in economic life, and its consequent emphasis on the dynamical, as distinguished from the purely statical elements in industrial and commercial organisation. Such a method of study is generally concrete: for in dealing with a process of growth the interaction of the different elements of social life on one another cannot be overlooked. It is true that a certain amount of abstraction is possible even here. Particular lines of tendency may be traced in the development of industrial life, without any special attention being directed to the special circumstances of different countries or districts, or strata of society, by which the general movement is modified. Such abstraction as this is necessary in a scientific study of any kind. Indeed, even the history of a battle, or any other concrete event, is necessarily abstract, in the sense that it fastens upon certain salient features, and omits what are regarded as unessential details. And this is much more obviously the case when we are endeavouring to trace the history of a great movement, with

a view to the discovery of the broad principles by which it is governed. In this sense, then, even the historical method may be said to be to some extent abstract. Still, it may fairly enough be contrasted with the abstract method of economic study, inasmuch as the elements which the historical method omits are merely those that are regarded as too insignificant, or too limited in their sphere, to have any important influence on the concrete process of development as a whole; whereas, in the abstract method proper, the elements from which abstraction is made are sometimes confessedly of scarcely, if at all, less importance in the concrete life of a country than those to which attention is specially directed. The historical method may, therefore, be described as one particular way in which the concrete study of economics is pursued. It is not, however, the only way. The study of concrete facts at a particular time and place—*e.g.* such facts as those contained in Mr. Charles Booth's *Labour and Life of the People*—cannot properly be said to be an illustration of the historical method, except in so far as these facts are brought into comparison with corresponding facts at other times and places, so as to throw light on the process of historical development. The method of Le Play, on the other hand, in dealing with similar matters, is much more distinctly historical. Thus it appears that the method of economic study may be concrete without being definitely historical.

Again, the historical method is not necessarily inductive, in the sense at least in which the inductive method is sharply contrasted with the deductive. No doubt, any valuable historical generalisation must rest on a certain basis of inductive inquiry. But so also must all valuable generalisations with reference to the more statical conditions of human life. But after having, by some process of induction, reached certain general principles, the historical method, no less than the statical, may proceed largely in a deductive way. There may be laws or tendencies of historical development, as well as laws or tendencies operative under particular hypothetical conditions;[1] and if it is possible to formulate laws of the former kind, their consequences may be worked out deductively, just as the consequences of the latter kind of laws may be traced. The only qualification to this seems to be that laws of the former class are generally more complex in their character than those of the latter class; and it is more obviously necessary in the case of the former to take account of the particular circumstances by which their action is modified. Thus on the whole it remains true that the historical method tends to be more inductive than the statical method.

The prominence which has been given to the historical method in recent times is due to a variety of causes, but chiefly to the introduction of that new view of human society which is commonly described as the organic view. The more statical method of study was introduced at a time when the physical and mathematical sciences were predominant, and when human society tended to be thought of as a more or less mechanical system. With the growth of biological science, and especially with the introduction of the theory of development, a new point of view was made possible. Society came to be regarded, not as a mechanical compound of independent elements, but as an organic unity, composed of parts vitally related to one another, and undergoing a continuous process of development. Such writers as Montesquieu, Burke, Hegel, and Comte all contributed, in different ways, to the introduction of this conception; and wherever it has been introduced, it has made the statical method of study appear inadequate.

Any attempt to balance the importance of the historical method against others would be somewhat beyond the scope of such an article as this. There can be no doubt that some of its advocates have unduly depreciated what they regarded as rival methods. The more statical and the more abstract and the more deductive methods have their own place. The historical method, however, may claim to be the most comprehensive. Other methods have a place within it, rather than it within them. They supply material for it to use and synthesise.

It may be observed, in conclusion, that the adoption of the historical method necessarily brings economics into closer relation to other departments of study than that which belongs to it when it is treated in a more statical way. The influence of political institutions, religion, education, moral principles, etc., cannot be overlooked in dealing with social evolution, even when special emphasis is laid on its industrial side. Economics thus comes to be regarded as a special department of sociology or social philosophy, rather than a strictly independent science. This need not, of course, prevent the recognition of the possibility of making a special study of the industrial side of life, or even of gaining valuable light by confining the attention for a time to that side of life, or to some special aspect of that side. Further, the historical method of study leads us to regard the growth of social life as having reference to an end. A process of development is naturally thought of as a development towards something. The consideration of the ideal form of social order thus comes into prominence, and in this

[1] *Cp.* Keynes, *Scope and Method of Political Econ.*, pp. 303-4, 1st ed. As an illustration of laws of the former kind, reference may be made to the generalisation of List, in his *Theorie des Nationalen Systems der politischen Oekonomie*, with reference to the stages of economic development through which the nations of the temperate zone pass.

way the study of economic science is brought very closely into relation to ethics.

[For further discussions in connection with this subject, see also ABSTRACT POL. ECC.; ANALYTICAL METHOD; A POSTERIORI REASONING; A PRIORI REASONING; DEDUCTIVE METHOD; POL. ECON. AND SCIENCE; INDUCTIVE METHOD. For a list of books and articles dealing with economic method, see the close of the article on DEDUCTIVE METHOD. The best general treatment of the subject is Keynes's *Scope and Method of Political Economy*, 1st edition. Chaps. iv. and ix. bear especially on the subject of the present article. Bonar's *Philosophy and Political Economy in some of their Historical Relations* will be found useful, though it deals very slightly with the influence of Comte and the development of the historical school. Special reference may also be made to Knies's *Die politische Oekonomie vom geschichtlichen Standpunkte.*—Menger's *Die Irrthümer des Historismus in der deutschen Nationalökonomie.*—Mill's *Logic*, bk. v. ch. x. "Of the Inverse Deductive or Historical Method."—Cliffe Leslie's *Essays in Political and Moral Philosophy.*—The article on "Political Economy" by Professor Ingram in the ninth edition of the *Encyclopædia Britannica.*—Professor Sidgwick's article on "The Historical Method" in *Mind*, old series, vol. xi. No. 2.—Suggestive remarks will also be found in Prof. Sorley's essay on "The Historical Method" (*Essays in Philosophical Criticism*, pp. 102-125)—in Mr. D. G. Ritchie's article "What are Economic Laws" (*Economic Review*, vol. ii. No. 3, pp. 359-377); and in several other recent articles and discussions.] J. S. M.

HISTORICAL SCHOOL OF ECONOMISTS. This is the designation frequently given to a number of writers and teachers, whose work has been marked by certain common traits, and who have exercised an influence tending in general in the same direction. Their teaching, while in large part constructive, has yet been to an equally large extent critical of the methods and results of what is variously described as the "classical," "deductive," or "theoretic" school of economists (see CLASSICAL ECONOMICS; DEDUCTIVE METHOD). The "classical" school may be said to have remained up to the present dominant in England; it is strong in Austria and Italy; and it has included the names best known among the economists of the generation now passing away in France and America. Although, therefore, the historical school is now perhaps on the whole supreme in Germany, has representatives in all other important countries, including England, and is recognised as having done good service to economic science, the value of the movement as a whole cannot but be regarded as still *sub judice*. Moreover, even a colourless description of the movement as a whole would probably lead to misconception, owing to the marked divergencies between its representatives. The present article will, therefore, attempt only to trace the sequence and affiliation of ideas; and the reader will refer to separate articles for a fuller account of the personages referred to.

Cliffe LESLIE raised the cry: "Back to Adam Smith." But it can hardly be doubted that Smith's frame of mind was on the whole essentially unhistorical, and that historical narration and inductive reasoning were with him subordinate to a deductive movement of thought. Malthus adduced a wealth of historical information in support of his doctrine of population. But the historical school can hardly be said to have made its appearance until the "orthodox" or "abstract" structure had been completed in England by Ricardo (1817), and there popularised by the Epigoni, and until the facile expositions of J. B. SAY (*Traité*, 1803, *Cours*, 1828) had diffused over the civilised world the principles on which the whole edifice of orthodox theory rested. The immediate literary creator of the historical school was Wilhelm ROSCHER, writing in 1843. Two writers, however, were, in different senses, forerunners of the movement,—Jones and List; and another, who was contemporary with its beginnings, but exercised no influence on it until a much later stage, was Auguste Comte.

In the midst of the growing success of the Ricardian group, Richard JONES (*Essay on the Distribution of Wealth*, 1831), protested that its conclusions, especially those concerning rent, applied only to a very recent period and a very small area. He urged with excellent soberness the need for historical investigation; but his plea fell on deaf ears, and the only trace of his influence in economic literature for many years is to be found in J. S. Mill's treatment of peasant tenures. His German contemporary LIST (*National System of Pol. Econ.*, 1841), enormous as was his practical political influence in his own country, must as an economist be regarded as the prophet of a new movement rather than its initiator. His grouping of the economic history of the civilised nations of the temperate zone under five stages was a very rough and ready sketch, and, indeed, inaccurate; yet it threw into German thought the idea of historical evolution, the fruitful parent of more adequate formulæ.

Meanwhile A. COMTE (*Cours de Philosophie Positive*, 1839-42) was stating the same idea in more philosophical form. To him it seemed that economic phenomena were so intertwined with other social facts that a separate science of them was impossible. The all-inclusive science of society, SOCIOLOGY, he divided into social statics, dealing with facts of co-existence, and social dynamics, dealing with facts of sequence. For social statics the appropriate method was that of direct observation, for dynamics that of comparison,—which could only be effected by means of history. These ideas have of late penetrated into English economic circles through the writings of Dr.

Ingram; they are familiar to the German economists of to-day. But Comte's writings were altogether unknown to German economists forty years ago; and the historical school proper, in its earlier phases, was an entirely independent product of German thought.

The decisive word was spoken in the *Grundriss zu Vorlesungen über die Staatswirthschaft nach geschichtlicher Methode* issued by the then young Professor Wilhelm Roscher at Göttingen in 1843. He told his hearers that his teaching would be guided by the historical method, and that he "aimed at reaching for political economy a result somewhat similar to that reached in jurisprudence by the Savigny-Eichhorn method." Thus with Roscher the new inspiration was the direct result of the effect on contemporary German thought of the arguments of the historical school in jurisprudence. This school had argued that the legal institutions and ideas of a particular period and country were not to be regarded as eternal and necessary, but as the result of a long growth; and that earlier practices are not so much to be condemned from the modern standpoint as explained in their relation to environing conditions. These ideas were readily transferable to the economic sphere. Hence the historical "method" was, from the first, more than a method with Roscher. It seemed to bring with it, as self-evident, the principle of relativity. This he explained in the well-known and oft-quoted *Preface*. The shape which, in his opinion, political economy ought to assume is indicated in his description of it as the doctrine (*Lehre*) of the laws of development (*Entwickelungsgesetze*) of the national economy (*Volkswirthschaft*). By the side of this phrase, and as equivalent to it, he placed in his later writings what he called the "fine definition" of Von Mangoldt,—"the philosophy of economic history."

Roscher has in recent years been criticised, by some approvingly by others disapprovingly, for his supposed failure to make any effort to reach his own ideal. It is true that his *Grundlagen*, the only volume of his great *System* that has been translated into English, is constructed very much on the old lines, and has been not inaptly described as Mill's *Principles* annotated with citations from the history of economic literature. But this is scientifically the least important of his works. In his *Essays* on particular subjects he was constantly under the influence of the thought of historical movement, though it found unsatisfactory expression in his use of such terms as "higher and lower stages of civilisation," "youth," "maturity," and "old age"; and he was curiously possessed by the thought that all civilised nations have to run through a like experience. It must be remembered, however, that in spite of his fondness for "*Entwickelung*," Roscher had received his historical training in an old-fashioned, pre-evolutionary, school. His best work is to be seen in the volumes on *Ackerbau* (Agriculture, 1st ed. 1859; 12th ed. 1888), and *Handels- und Gewerbefleiss* (Trade and Industry, 1st ed. 1881; 6th ed. 1892), in his *System*. Here he traces the growth and varying shapes of concrete economic institutions,—the bony framework of society; and these two volumes, when compared with the space given to the same topics in the *Grundriss*, were clearly from the first intended to form the main body of his great treatise. They set an example now generally followed in German universities, but hitherto exercising little influence in other lands. The criticism to which Roscher's *System* is open—and, in their measure, such university courses of instruction also as follow in its footsteps,—is that the separation between the *Grundlagen* and the subsequent parts keeps matters asunder which need to be considered together. It is unsatisfactory, for instance, that the theory of wages and the history of trades unions should each be dealt with in isolation, and that they should be brought into no sort of vital relation with one another.

Soon after the appearance of Roscher's *Grundriss*, the movement to which it gave rise was reinforced by the advent of two other writers, who have since been justly regarded as joint-founders with Roscher of the historical school—Bruno HILDEBRAND, and Karl Knies. Hildebrand's *Nationalökonomie der Gegenwart und Zukunft* (1848) was never completed; and the first and only volume was chiefly critical. It is from this that the current German criticisms of Adam SMITH have been chiefly drawn. Hildebrand's ultimate object, as declared in his Preface, seems but an echo of Roscher; it is "to transform political economy into a doctrine (or teaching) of the laws of the economic development of nations." But he held to this conception much more firmly than Roscher did, and expressed it in far more attractive language. Perhaps the best statement of it is presented in the prefatory announcement with which he began the publication of his *Jahrbücher für Nationalökonomie und Statistik* in 1863: "The economy of nations is, like their language, literature, law, and art, a branch of their civilisation; like these other branches it moves within certain limits set by natural law; but within these limits it is a product of freedom and of the labour of the human spirit. Accordingly the science which deals with it is no abstract science, like the natural sciences stating the same law for all relations in time and space, and measuring everything by the same measure. On the contrary, it has for its object to investigate the movement of historical evolution, from stage to stage, alike in the case of individual peoples and in the case of mankind at large, and so to discover the link which the labour of

the present generation is to add to the chain of social development. The economic history of civilisation, and with it general political and legal history and statistics, are the only sure foundations whereupon may be erected any useful further construction of economic science. But history must not be the excuse for indifference, or divert men of science from the practical problem of the time. The understanding of the present is most vitally bound up with the understanding of the past; and he can have no right understanding of history to whom the conditions and needs of his own time are unknown."

Towards the end which he proposed Hildebrand's contribution was twofold. To him is due the distinction between *Natural-, Geld-, und Credit-wirthschaft* (incidentally in his book of 1848; elaborately worked out in his *Jahrbuch*, vol. ii. 1864), which has proved so useful a formula in subsequent historical writing; and the *Jahrbuch* founded by him was the first to furnish a medium for monographs by younger men on economic history.

Professor Knies is undoubtedly a scholar of far deeper philosophic insight than Roscher or Hildebrand. And his work *Die Politische Oekonomie vom Standpuncte der geschichtlichen Methode* (1853) was an elaborate and penetrating criticism of current ideas which even men like Roscher and Hildebrand had handled with scanty discrimination. Thus, as has been well said by Professor Schmoller, his book might almost be called "Prolegomena to a whole scientific epoch." "Whoever," remarks the same writer, "began his economic studies in the decade 1850-1860, knows how deep its influence has been, and how in certain respects it served as a confession of faith to the whole German school."

The thought on which Knies laid most stress was that of the development of economic *opinion* parallel with the development of economic conditions. The idea of the relativity of *doctrine*, already brought forward by Roscher, peculiarly interested him. And, although he encouraged historical study, and was ready to utilise its results, his book probably tended to turn some younger men from pursuing the path opened to them by Roscher and Hildebrand—the search for laws of economic evolution. On the other hand, he had no sympathy with the view which even Roscher had held that the classical doctrine, perhaps in some modified form, could be regarded as an "Allgemeiner Theil," or "Grundlagen," to be studied first. He urged that it rested on conceptions of property, contract, etc., which were themselves the result of history, and which were inextricably bound up with shifting conditions of time and place. That part of the theory which was composed of propositions of absolutely general validity, like the propositions of natural science, would be found to be small indeed.

Until about 1870 the waves of thought set flowing by these three writers, Roscher in Leipzig, Hildebrand in Jena, and Knies in Heidelberg, quietly spread over Germany, and took possession of the universities with but little opposition. With divergencies already indicated, the new movement had everywhere the characteristics of insisting—(1) on the relativity of economic theory, (2) on the desirability of the study of economic history—including therein the empirical and statistical observation of the present. Much detail work was done in these latter directions. Outside the country itself, the movement was unknown.

The foundation of the *Verein für Sozial-Politik* at the Eisenach Congress of economists and public men in 1872, gave the signal for an outburst of controversy. Hitherto the professional economists had not made themselves heard in practical politics: now they united in recognising the existence of a "social question," and in invoking the action of the state towards its solution. They thus incurred the enmity of a great many journalists and politicians; and as most of them were the disciples of Roscher, or Hildebrand, or Knies, the "historical school" became a synonym for the SOCIALISTS OF THE CHAIR. Even among economists themselves, the term was used to shelter all who were in any way dissatisfied with the classical economists and their German followers—to include the "inductive," the "realistic," and the "ethical" within its embrace. Roscher himself in 1874, in his *Geschichte der National-Oekonomik in Deutschland*, seemed to imply that the "realistic," the "historical," and the "ethical" directions were all much the same. But as soon as men of ability, thus for the time brought together in one camp, got beyond the utterance of generalities, divergencies were sure to make themselves felt. Professor Adolph Wagner of Berlin began about 1877, in the *Allgemeine oder Theoretische Volkswirthschaftslehre*, forming the first volume of a great *Lehrbuch*, the construction of a new edifice of economic theory to replace that of the PHYSIOCRATS and Adam SMITH. Professor Gustav Schmoller of Strasburg (since of Berlin) maintained, on the contrary, that the time had not come for such an attempt, and that it should be preceded by a period of empirical, statistical, and historical inquiry. He established a series of *Staats- und sozialwissenschaftliche Forschungen*, wherein, under his guidance, his pupils have published a series of valuable investigations. It was perhaps hardly made sufficiently clear that the generalisations or "laws" at which such historical work was ultimately aiming were not so much laws of coexistence as laws of sequence; to use Comte's phrase, "dynamic" rather than "static." When the AUSTRIAN SCHOOL (*q.v.*) made itself heard, Professor Schmoller and those who agreed with him lamented—not so

much that a fresh resort should be made to abstraction and deduction, and that attention should be concentrated anew by some thinkers on the problem of value—but that this problem should be declared the main problem of economics, and those methods its most appropriate ones. On the other hand it became the practice of those who agreed either with Professor Wagner or Professor Menger to speak of Professor Schmoller as an example of "extreme *Historismus*." But it is not clear that Professor Schmoller and his disciples have gone beyond the positions assumed by the founders of the school. In his recent article on *Volkswirthschaft, Volkswirthschaftslehre und -methode* (Conrad's *Handwörterbuch*, 1894), Schmoller writes: "The more inquiry is limited to a particular state of economic affairs, and this is provisionally treated as stable—certainly an allowable methodological device,—the easier it is to grasp the dominant psychical and other causes, to derive therefrom typical forms of organisation, and to explain the elementary and typical economic processes. Whether these are called 'laws' or 'hypothetical truths,' they are, when used with due limitation, the great instruments of knowledge, and the bases of right economic policy." Schmoller goes on, indeed, to say that "they are not ultimate truths. It is necessary to carry through a deeper investigation of the changing causes, and the changing economic forms and processes. This investigation will be threefold—(1) into the shaping of the psychological causes, (2) into the history of economic organisation, (3) into the progress of humanity as a whole." For the first, Schmoller urges a psychological study which shall be wider than the somewhat antiquated balancing of pleasures and pains or utilities; as to the second, he remarks that the older historical economics pointed to the goal, and recent work in economic history has begun to collect and interpret the necessary material; and dangerous as the third may be, entering as it does into the fields of the philosophy of history, of teleology, of hopes and prophecies, such bold syntheses will always be necessary to guide us in practical action.

Meanwhile in England, as far back as 1866, Thorold Rogers had set the example of thorough investigation into the economic life of the past in his *History of Agriculture and Prices in England* (vols. i. and ii., 1866). It was Cliffe Leslie, however, who first introduced to English thought the ideas which had long been making their way in Germany. In his essay on *The Political Economy of Adam Smith* (1870), Cliffe Leslie criticised the conception then common in England that political economy was a body of necessary and universal truth; and in that *On the Philosophical Method of Political Economy* (1876), he argued that "the whole economy of every nation is the result of a long evolution in which there has been both continuity and change, and of which the economical side is only a particular aspect or phase. And the laws of which it is the result must be sought in history and the general laws of society and social evolution." Cliffe Leslie was thus the first to bring together and unite the teaching of Knies, and Comte; this has been since done more thoroughly, and with a more complete acceptance of Comte's social philosophy by Dr. Ingram in his *History of Political Economy* (in *Ency. Brit.*, 1885; separately 1888). Cliffe Leslie's criticism has resulted in a more careful statement of their "postulates," by most English writers since,—as by Bagehot, in *Economic Studies*, 1879. But, as in Germany, so in England, there was urgent need that a beginning should be made in the detailed study and systematic teaching of economic history; in England it was from Dr. William Cunningham that the impulse was given in this direction, both by his writings (*Growth of English Industry and Commerce*, 1882; a new and much larger work under the same title, vol. i. 1890, vol. ii. 1892), and by his academic activity in Cambridge. A little later Arnold Toynbee directed the attention of students at Oxford to the "Industrial Revolution of the 18th century" (lectures published in 1884). And interest in the subject has since been stimulated from the historical and legal side by the works of Mr. Seebohm, (*English Village Communities*, 1883; *Tribal System*, 1895); Professor Maitland (*Select Pleas in Manorial Courts*, 1889); and Professor Vinogradoff (*Villainage in England*, 1892); from the statistical side by Mr. Charles Booth's *Labour and Life of the People* (1889); and from the evolutionary socialistic side by the writings of Mr. Sidney Webb (*History of Trade Unionism*, 1894), and others. It has begun to find a place in the requirements of Oxford and Cambridge examinations; in America, courses of lectures are regularly delivered upon it in most of the important universities and colleges, usually in connection with departments of economics, but sometimes in connection with departments of history; and in Harvard a professorial chair has been created with this object. Those who are engaged in this work differ, however, widely from one another in their attitude towards the current English theoretic teaching.

The position of the historical school in the three countries, Germany, England, and America, is affected very largely by academic organisation. In Germany there is a recognised distinction between the "Grundlegung" or "Allgemeiner Theil" and other departments of economics. The historical school are in practice to be distinguished from various theoretic schools—(1) by their insistence on the vital importance of a thorough study of economic history *after* the "Grundlegung";

(2) by the comparatively small compass into which they would compress the "Grundlegung"; (3) by the comparatively slight attention they would give to the psychology of "value" as a part of the "Grundlegung"; (4) by surrounding the individualist economics of self-interest there stated by general anthropological and historico-philosophical considerations. In England there is no such recognised distinction between the "Grundlegung" and other parts. Indeed, economic teaching in that country seldom includes more than the "Grundlegung." In America, following the example of Harvard, the tendency is to appoint teachers of economic history side by side with teachers of economic theory and finance; to make each "course" independent; and to leave each teacher to define his own relations to economic science as he pleases.

[There is no account of the historical school at all complete; and the student cannot dispense with reference to the actual writings of the leading authors mentioned above. Roscher's *Preface* of 1843 is translated in full in the *Quarterly Journal of Economics*, October 1894.—The best account, though sympathetic, is that of Dr. Ingram in *Hist. of Pol. Econ.*, ch. vi.—Professor Schmoller's essays on *Roscher* and *Knies* (*Zur Litteraturgeschichte der Staats und Socialwissenschaften*, 1888), are brilliant and illuminating surveys of parts of the field.—For a somewhat more partisan presentation of some of the questions at issue than would be suitable here, reference may be made to Ashley, *Econ. Hist.*, i. Preface (1888), and an introductory lecture *On the study of Economic History* in the *Quarterly Journal of Economics*, January 1893. — For a different point of view, see Marshall, *Present Position of Economics* (1885), and Keynes, *Scope and Method of Pol. Econ.* (1904). See also Aug. COMTE; ENGLISH SCHOOL; FRENCH SCHOOL; GERMAN SCHOOL; HELD; Cliffe LESLIE.] W. J. A.

HISTORY OF PRICES. See PRICES.

HITCHCOCK, ROBERT (16th century), of Caversfield, Bucks, served in the Netherlands under Charles V. in 1553.

His chief work, *A Politic Plot for the honour of the Prince* (Lond. 1st Jan. 1580, reprinted in Arber's *English Garner*), was one of the many schemes for the employment of the numerous idle but able-bodied vagrants who caused constant trouble in Elizabeth's reign. Hitchcock proposed that they should be employed as seamen in vessels to be fitted out for the herring and other fisheries, so that the profits which Holland enjoyed from this source might be secured to England. Hitchcock also wrote *The English Army Rations in the time of Queen Elizabeth* (appended to W. Garrard's *The Art of Warre*, 1591), which contains statistics of the victuals necessary for soldiers in garrisons. He quotes from his own experience of the time when he was in charge of 200 pioneers at Berwick in 1551.

[W. Cunningham, *Growth of English Industry and Commerce, Modern Times*, 1893.] R. H. H.

HOARDING. When practised by a community, or by large numbers of its members, hoarding becomes an economic fact worthy of investigation. It may arise from commercial panic, from distrust of existing forms of investment, or from a want of any opportunity of investment. Or it may arise from misgovernment, and the consequent distrust of the holders of power.

In earlier times there was little or no industrial use for capital, except in agriculture or trade; and beyond the limited field of lending on mortgage, or at usury, to those who were oppressed by debt, there was no way of obtaining a return upon capital without entering into active trade. In England, almost up to the close of the 17th century, tradesmen or merchants retiring from business lived literally upon their savings. It is stated that the father of Pope, the poet, having amassed a fortune in trade in London, retired to the country about the time of the Revolution, carrying with him a strong box containing nearly £20,000, out of which he took from time to time whatever was required for household expenses. It was the opinion of writers about the same time, that very large sums were constantly kept hidden in secret places. Probably distrust was largely the cause of some of these cases; and from such or mixed motives these practices continued well into this century, until the growth of our system of banking, and the appreciation of its advantage and safety, together with the increase of joint-stock enterprises, has rendered hoarding no longer necessary. It still continues to be extensively practised in France, partly from the different condition of banking there, and partly from general distrust. The greater part of the war indemnity paid to Germany in 1871 was produced from the hoards of the French peasantry; and the same source supplied a large part of the gold required for the change of standard in Germany a few years later.

The most extensive system of hoarding of which there is any record is that which exists in India, and has been going on there for a very long period. This has undoubtedly arisen from the unscrupulous character of the former rulers of the country, and the habits induced by ages of misgovernment continue to influence the people in their present condition of security, and under their increased opportunities. Both gold and silver, in the form of bullion, of coin, and ornaments are hoarded by the natives of every class. Estimates as to the amount of wealth lying dormant in this way differ very widely, but the population is so numerous, and the habit so universal, that the amount must be very large. Enormous hoards are known to be in the possession of some of the native princes; and from the age of some of the coins contained among these treasures it is evident that the accumulation must have commenced hundreds of years ago.

Among the most civilised communities,

hoarding takes place at times of commercial panic. There is an almost universal distrust, and those who are able to obtain possession of coin or currency store it up, partly to enable them to meet their own impending obligations, and partly out of fear that later on they will not be able to obtain it. Direct evidence of this practice is not usually easy to obtain, but it is clearly indicated by the returns during the panic in London, in 1866. From the 21st March to the 30th May there was a steady decrease in the bullion at the Bank, amounting to £2,578,000 (see DRAIN OF BULLION). Yet at this time the country was gaining gold to much the same extent as usual, the net import during the three months April to June being more than 4 millions. During the same period the notes in circulation increased from 20½ millions to 26 millions, so that there must have been more than 12 millions, in notes and gold, withdrawn and hoarded.

The financial crisis in the United States in 1893 supplies another example, but no direct evidence of the fact is obtainable. The country had an ample supply of currency, not less than 100 millions of dollars (20 millions sterling) having been added thereto during the preceding three years, and their banking facilities were ample, yet there was for a while a perfect currency famine, and firms of the highest standing could scarcely obtain loans upon the most undoubted security.

[See report of Royal Commission on Gold and Silver, vol. i. 1887.—For hoarding in France and Germany: evidence of Mr. W. Fowler.—For hoarding in India: evidence of Sir D. Barbour.—For particulars of hoarding by Maharajah of Burdwan, see ibid. appendix v.—also letter in *Bankers Magazine*, London, 1893, vol. lvi. p. 205.—For currency crisis in U.S., see *Journal Inst. HOBBES, THOMAS (1588-1679), one of the most distinguished of English philosophers, was born at Malmesbury in Wiltshire, and died at Hardwick, a seat of the Earl of Devonshire. After attending a private school, he became a member of Magdalen Hall, Oxford, and took his B.A. degree in February 1608. Hobbes was recommended to the Earl of Devonshire as a tutor for his eldest son, and thus formed a connection with the great house of Cavendish which lasted to the end of his life, secured him from want, and gave him also the leisure necessary for meditation and study. Afraid that he had given offence by his writings on political philosophy, Hobbes left England at the time of the meeting of the Long Parliament in 1640, and spent eleven years in Paris. Here he made the acquaintance of the prince of Wales, afterwards Charles II. He returned to England in 1651, and from 1653 lived with the Cavendish family. His writings were denounced by some as hostile to liberty and by others as hostile to religion. He was also involved in several scientific controversies; but he never experienced actual persecution. In the course of his long life, almost entirely devoted to study and to composition, Hobbes wrote many works on a variety of subjects, philosophical, theological, mathematical, physical, and literary. A collected edition of his Latin writings in five, and of his English writings in eleven volumes, was published between 1839 and 1845 by Sir William Molesworth. None of these writings can strictly be termed economical. Ch. xxii. of Hobbes's best-known treatise of political philosophy, *Leviathan* (published 1651), entitled "Of Systems subject, Political and Private," contains, however, some remarks upon the nature and influence of "bodies politic for ordering of trade," *i.e.* those privileged companies which in the 17th century carried on so much of the foreign trade of England. "The end of their incorporating is to make their gain the greater; which is done in two ways—by sole buying and sole selling, both at home and abroad." Both are gainful to the privileged body because thereby they buy at lower and sell at higher rates. "Of this double monopoly one part is disadvantageous to the people at home, the other to foreigners." But Hobbes thinks that it would be very profitable for a commonwealth if its merchants were bound up into one body to buy in foreign markets, whilst at liberty at home every man to buy and sell at what price he could. For in this way their mutual competition would act only to cheapen the commodities which they sell at home, not to enhance the price of the commodities which they buy abroad. The suggestion is ingenious, although impracticable. The economic doctrine of the *Leviathan* is chiefly contained in ch. xxiv., "Of the Nutrition and Procreation of a Commonwealth." This figurative title is thus explained by the author: "The nutrition of a commonwealth consisted in the plenty and distribution of materials conducing to life; in concoction or preparation; and when concocted, in the conveyance of it by convenient conduits to the public use." The materials of nutrition—animal, vegetable, and mineral substances—are the gift of God; but, as they are partly natural partly foreign, a commonwealth must import that which it lacks "either by exchange or by just war or by labour. For a man's labour also is a commodity exchangeable for benefit as well as any other thing; and there have been commonwealths that, having no more territory than hath served them for habitation, have, nevertheless, not only maintained but also increased their power, partly by the labour of trading from one place to another, and partly by selling the manufactures whereof the materials were brought in from other places."

The distribution of the materials of nourishment "is the constitution of mine and thine and his; that is to say in one word propriety (property)." Hobbes is at pains to show that this distribution is entirely the work of the sovereign. This doctrine follows from his general conception of sovereign power as in every sense absolute, and the creator of all social arrangements. But the progress of historical knowledge has rendered his proposition unmeaning. Whilst dealing with distribution, Hobbes makes some very sensible remarks on the impracticability of setting aside any fixed fund or estate to defray the public expenses. It is impossible to prevent sovereign power from falling into extravagant hands; and besides, "commonwealths can endure no diet," since their expense is not limited by their own will, but by "external accidents and the appetites of their neighbours."

By concoction Hobbes understands "the reducing of all commodities which are not presently consumed, but reserved for nourishment in time to come, to something of equal value, and withal so portable as not to hinder the motion of men from place to place; to the end a man may have in what place soever such nourishment as the place affordeth. And this is nothing else but gold and silver and money." The natural advantages of gold and silver for this purpose are then explained clearly but incompletely.

Lastly the procreation of a commonwealth is explained as the sending out of plantations or colonies. But nothing is said respecting the economic effects of colonisation.

It may be regretted that a writer of so much analytical power as Hobbes should have bestowed so little attention upon economics. But the explanation is to be found in the circumstances of his time and in the objects of his writings, so far as they deal with political science. The period at which Hobbes published the *Leviathan* was one of political confusion ending in civil war. The original cause of discord was not, as in our time, economic but religious. Men were contending, not for a greater share of the means of material well-being, but for freedom to worship as suited their conscience, and for power to force their mode of worship on those with whose conscience it did not agree. Hobbes endeavoured to extirpate the principle of strife by showing that every species of sovereign is and ought to be absolute, so that resistance to the will of the sovereign, whether prompted by religious zeal or any other motive, is always illogical, immoral, and destructive to society. The real importance of Hobbes's political treatises is to be found not in any occasional remarks upon economic subjects, but in his theory of sovereignty, which was developed by Bentham and the followers of Bentham, and through their writings has passed into current English thought

Econ.*, 1893.—Roscher, *Zur Geschichte der Englischen Volkswirthschaftslehre* (1851), pp. 47-53.] F. C. M.

HOCK, Baron Karl von (1808-1869). Of Jewish descent, after having studied in the universities of Prague and Vienna, Von Hock entered the financial ministry of Austria and became director of the customs in Trieste and in Vienna. Later on (in 1867) the emperor made him a member of the upper house of the Austrian parliament. His first literary productions were novels, a book on *Descartes and his Opponents* (1835), and another on *Pope Sylvester II. and his Times* (1837), which has been translated into French. When director of the customs in Trieste, he wrote against List's system of national protection (*Der Handel Oesterreichs*, 1844); List, who recognised in him a worthy opponent, told him that with the increase of his practical knowledge of trade and industry he would come round to milder economic views, and Von Hock himself confessed in his *Oeffentliche Abgaben und Schulden* (Public Taxes and Debts), 1863, that he had indeed receded from his former unbending free-trading principles. This treatise is described by Professor Ad. Wagner as presenting "in its pregnant conciseness an almost perfect science of finance, and being by far the best on the technique of finance" (*Finanzwiss.* i. 52). Roscher considered that "it provides a fairly (*ziemlich*) complete science for highly cultivated states, although it reads more like the conversation of a highly-gifted and learned man than as a book intended for the use of teachers," but expressly praised Von Hock's "nice distinctions on the incidence and shifting of taxation" (*Gesch. der Nat. Oek. in Deutschland*, p. 1030). According to Professor Bastable, "it is specially good, as might have been expected from the production of a trained official, in its discussion of administrative points" (*Public Finance*, pp. 28-29, 3rd ed.)

Von Hock also published in 1857 *Die Finanzverwaltung Frankreich's* and in 1867 *Finanzen und Finanzengeschichte der Vereinigten Staaten von Amerika*. In the former, translated into French in 1859, the author has purely descriptive aims; although he expressly disclaims comparative criticism, he concludes his preface by holding up as a model the German system "with the simplicity of its organisation and the small number of its well-paid and independent officials." E. Ca.

HODGSKIN, Thomas (19th century), started, with J. Robertson, in 1823, the *Mechanics' Magazine*, and, in 1824, became joint hon. sec. of the London Mechanics' Institute, the predecessor of the present Birkbeck Institute. In 1826 he delivered a course of four lectures on *Popular Political Economy*, published 1827, with numerous additions, mainly of a controversial character,

The main drift of the book is to justify the natural laws which regulate the production of wealth as opposed to the political and social institutions of men. For this purpose the statement of Adam Smith that labour was the *original* producer of all wealth becomes converted into the proposition that "there is no wealth which is not the produce of labour," which carries the inference that private ownership of land is unrighteous. Stress is laid, following J. B. Say, on the influence of knowledge in adding to productive power. Knowledge is developed by the increasing need of it. "Necessity is the mother of invention, and the continual existence of necessity can only be explained by the continual increase of people." Thus, incidentally, the principle of the increase of knowledge, together with that of the division of labour, serves to refute Malthus (see MALTHUS). Hodgskin writes in a highly dogmatic style, *e.g.*: "There is and can be no other rule for determining the relative value of commodities than the quantity of labour required to produce them." "Accumulation of capital, in the present state of society, checks production, and consequently checks the progress of population . . . and of national wealth." The book does not appear to have met with much success, as a promised continuation was never issued.

The importance of Hodgskin lies in the influence of his writings on Karl Marx. [S. and B. Webb, *The History of Trade Unionism*, London, 1894, 8vo, p. 147.—Menger, Anton, *Recht auf den vollen Arbeitsertrag*, 2nd ed., 1891, p. 52 n]. In a letter to Lord Brougham, James Mill writes [Bain's *James Mill*, 1882, p. 363]: "The mad nonsense of our friend Hodgskin, which he has published as a system." In bibliography of *History of Trade Unionism*, an anon. tract, *Labour Defended against the Claims of Capital* . . . by a labourer, 1825, 12mo, is ascribed to Hodgskin [referred to by Böhm-Bawerk, *Capital and Interest*, p. 318, Eng. trans. 1890]; in Karl Marx's *Capital*, French ed., note on p. 335, another anon. work, *The Natural and Artificial Rights of Property* is further ascribed to him.

[Mention is made of Hodgskin in Goddard's *Life of Birkbeck*, London, 1884.] H. E. E.

HODGSON, JAMES, F.R.S. (1672-1755), mathematician, and an intimate friend of Flamsteed; author of *The Valuation of Annuities upon Lives deduced from the London Bills of Mortality* (Lond., 1747), besides some mathematical and astronomical works. R. H. H.

HODGSON, WILLIAM BALLANTYNE (1815-1880), was born in Edinburgh, where he was educated at the High School, and entered the university at the age of fourteen. After leaving college he devoted himself to lecturing on education, literature, and phrenology, and also to journalism. He was much influenced by George Combe's *Constitution of Man*, which, altogether apart from the phrenology, he considered a most valuable work. In 1839 he was appointed secretary to the Mechanics Institute, Liverpool, in which he had to control a large number of lectures, and in acknowledgment of his success he was appointed principal. In 1858 he was appointed one of the assistant commissioners to the Newcastle Commission on primary education. In 1870 the Merchant Company of Edinburgh were empowered to use part of their trust funds for the foundation of a chair of political economy in the university of Edinburgh, and Dr. Hodgson was appointed first professor in 1871. The appointment was for seven years only with a right of re-election. The limited tenure—annulled since (1892)—being different from that of all the other Scottish chairs, was such an annoyance that it was with great difficulty he was persuaded to accept re-election in 1878. He held the chair till his death. During his tenure he settled at the beautiful residential estate of Bonaly Tower, near Edinburgh, and here he accumulated a large library, his collection of economic works being presented on his death to the university of Edinburgh. He was twice married, and left by his second wife two sons and two daughters (the elder married to his successor Prof. J. Shield Nicholson).

Dr. Hodgson had a very wide circle of friends and acquaintances, and was a voluminous correspondent with many of the most eminent men of the time in education, literature, politics, and economics. Owing to the demands made upon his time by these and other social requirements, he unfortunately left no work worthy of his reputation. At the time of his death he was engaged on an English dictionary, and part of the materials were used as the basis of a popular work on *Errors in the Use of English* (Edinburgh, 1882), whilst another part of the materials has been incorporated in Dr. Murray's dictionary, now coming out. He wrote in an extremely lucid, attractive, and yet it may be said classical style, and he was an admirable speaker, and one of the best-known conversationalists of the day. In fact, it was by his personal influence mainly that his reputation was established as one of the foremost men in education and economics; and his literary remains give a very inadequate idea of his vast learning and of his remarkable powers of popularising difficult subjects. He may be described as an orthodox economist, but alike in matter and style to be ranked rather with Adam Smith than Ricardo. He was too widely read in many departments of literature and science to be affected by the narrowness of the traditional ultra-Ricardian school. His contributions to economic literature are reprints of lectures on *Competition* (1870).—*The True Scope of Economic Science* (1870).—*Importance of the Study of Economic Science as a Branch of Education for all Classes* (Royal Institution of Great Britain, 1854, third edition revised, Edinburgh, 1870).—*Economics of the Drink Manufacture* (1874).—*Inaugural Addresses at Edinburgh University* (1871 and 1878).—*Co-operative Congress* (1877).—The *Instruction of the Community, especially the Wage-Earning Classes, in*

Economic Science (Social Science Congress, 1877). He also translated CAVOUR's (*q.v.*) work on Ireland.

[J. M. D. Meiklejohn, *Life and Letters of W. B. Hodgson, LL.D.* of *Edinburgh*, 1883.—E. Woodhead, *Student Recollections of Professor Hodgson*, Edinburgh, 1883.—Prof. Nicholson, *Introductory Address at Edinburgh University*, 1881.]

J. S. N.

HOECK, JOHANN DANIEL ALBRECHT (1763-1839), was, during the year 1796, professor of philosophy and cameralistic science at Erlangen.

Previously he had been attached to the civil service, which he re-entered at the expiration of this single year of professorship, and became first a Prussian director of police with the rank of councillor of justice (*Justizrath*) and afterwards a councillor of government (*Regierungsrath*) in the Bavarian service.

Hoeck's works, *Grundlinien der Cameralpraxis* (1819), and *Materialien zur Finanzstatistik der deutschen Bundesstaaten* (1823), are distinguished by an extensive and practical knowledge of his subject, but are deficient in higher scientific qualities.

[*Allgemeine Deutsche Biographie.*] E. Ca.

HOFACKER, JOHANN DANIEL (1788-1828), doctor and professor at Tübingen. Besides medical publications, he was author of *Ueber die Eigenschaften, welche sich bei Menschen und Thieren von den Eltern auf die Nachkommen vererben, mit besonderer Rücksicht auf die Pferdezucht* (Tübingen, 1828), in which he maintained that in unions where the father is older than the mother, more males than females are born, and *vice versâ*.

[Conrad, *Handwörterbuch der Staatswissenschaften*, s.v., Jena, 1889, etc.] R. H. H.

HOFFMANN, JOHANN GOTTFRIED (1765-1847), statesman, statistician, and economist, was born at Breslau. He studied at Halle and afterwards at Leipzig. In 1798 he was a teacher in the Collegium Fredericianum at Königsberg. He was entrusted with several public employments through the influence of the President von Auerswald, and showed in all a high order of ability. Hence he was appointed in 1807 to the professorship of practical philosophy and cameral science at Königsberg, and in the following year was made councillor of state. He was made professor of political economy in the university of Berlin at its foundation in 1810. He directed the Prussian bureau of official statistics, which Stein had founded, from 1810 to 1844. He won the confidence of Hardenberg and became his principal adviser. He was at the headquarters of the allies in 1813, and was present at the conclusion of the peace of Paris and at the congress of Vienna, and accompanied Hardenberg on several of his diplomatic missions. After the peace, he held office in the ministry of foreign affairs, and resumed his duties at the university and the statistical board, which had for some time been necessarily suspended. In 1834 he resigned his professorship owing to failure of sight. He spent his last years in collecting and re-editing his numerous scattered essays and treatises. J. K. I.

The Prussian statistical bureau was completely remodelled in 1810, and Hoffmann, who may perhaps be considered as the founder of Prussian official statistics, was the first director under the new system. To him is due the radical change in the publication of the statistics of that country, which under his direction were issued as the well-known *Statistische Tabellen*, an official annual publication comprising very miscellaneous statistics. These tables in time became somewhat less comprehensive than at first. Most of Hoffmann's unofficial books were written late in life, after he had retired from office. Some are based on official figures collected by his department, and deal mainly with various aspects of population. His more individual and more strictly economic work is directed chiefly to questions of the freedom of labour and to finance. Generally speaking, his writings show approval of Prussian institutions, as then existing. He was the first who seriously advocated the adoption of the gold standard in Germany.

His most important works are :—*Das Interesse des Menschen und Bürgers bei den bestehenden Zunftverfassungen*, 1803.—*Die Lehre vom Gelde, [als Anleitung zu gründlichen Urtheilen über das Steuerwesen, mit besonderer Beziehung auf den Preussischen Staat,]* 1838.—*Die Bevölkerung des Preussischen Staates*, 1839.—*Die Lehre von den Steuern [als Anleitung zu gründlichen Urtheilen über das Geldwesen, mit besonderer Beziehung auf den Preussischen Staat,]* 1840.—*Die Befugniss zum Gewerbebetriebe [zur Berechtigung der Urtheile über Gewerbefreiheit und Gewerbezwang: mit besonderer Rücksicht auf den Preussischen Staat,]* 1841.—*Die Zeichen der Zeit im Deutschen Münzwesen [als Zugabe zu der Lehre vom Gelde und mit besonderer Rücksicht auf den Preussischen Staat,]* 1841.—*Das Verhältniss der Staatsgewalt zu den Vorstellungen ihrer Untergebenen*, 1842.—*Sammlung kleiner Schriften staatswirthschaftlichen Inhalts*, 1843.

[R. Böckh, *Die geschichtliche Entwicklung der amtlichen Statistik des preussischen Staats*, Berlin, 1863.—W. Roscher, *Geschichte der National Oekonomik in Deutschland*, München, 1874.]

R. H. H.

HOGENDORP, GYSBERT KAREL VAN (1762-1834), was born at Rotterdam. He first adopted a military career, afterwards studied law under Pestel at Leyden, graduated, and published at the same time an essay, *De æquabili descriptione subsidiorum inter gentes fœderatas*. He was appointed "pensionary" of Rotterdam during the revolutionary period (1795-1813), but he declined all public office and betook himself to trade as a member of the house Gysbert Karel van Hogendorp and Co. In 1813 he stood at the head of the movement

against Napoleon, and was a member of the provisional general government. After the return of the House of Orange he was invested with several high offices, but as he could not agree with the king's system of government he resigned them all, retaining only his seat in the second chamber of the states-general (the Dutch House of Commons), where he was almost the sole opposition member. In 1825 he returned to private life, and died 1834.

Hogendorp was in the first place a statesman, in the second an economist,—this is clearly shown by his works; he never gave a general statement of his principles, which therefore must be gathered from his writings on practical subjects.

In these he principally deals with the questions of taxation, national debts, free-trade, pauperism, and colonies. As to the general principles of taxation he shows himself in many respects a disciple of Adam Smith, like his contemporary Gogel (*q.v.*); from the latter, however, he widely differed, at least in his later period, by his views on the income-tax. In his *Lettres* he proposed such a tax on the basis of a classification of incomes. He approved of free-trade as conducing to national wealth. Government therefore should promote trade and industry only indirectly by good instruction, exhibitions, good roads, canals, etc. Yet he was not opposed to premiums on export, and low duties on the import of articles taxed at home. He did not regard pauperism as a necessary evil, and disagreed with Malthus's views on population. He early advocated the system of agricultural colonies. His ideas on colonial policy are very remarkable. The best means to promote the development of colonies, he thinks, is to keep political government entirely separate from trading, to let the inhabitants, natives as well as Europeans, obtain property in land, and to prohibit all monopolies.

[His principal economical works are these:—*Gedagten over 's Lands financiën, voorgedragen in Aanmerkingen op het Rapport tot een stelsel van algemeene belastingen, uitgebragt* 9 *Juli* 1800 (Thought on the Finances of the Country, being Comments on a Report on a System of General Taxation, dated 9th July 1800), Amsterdam, Wed. Doll., 1802.—*Verhandelingen over den Oost-Indischen handel* (Treatise on the East Indian Commerce), *Id.* 1802-3.—*Brieven aan een Participant in de O. I. Compagnie* (Letters to a Shareholder in the East Indian Company), *Id.* 1802-3.—*Missive over het Armenwezen* (Letter on Pauperism), *Id.* 1805.—*Bijdragen tot de huishouding van Staat in het Koningrijk der Nederlanden, verzameld ten dienste der Staten-Generaal* (Essays on the Economic Administration of the Kingdom of Holland, addressed to the States-General), the Hague, 1818-1825. A second edition, edited by the well-known statesman Thorbecke, was published at Zalt-Bommel in 1854.—*Lettres sur la prospérité publique, adressées à un Belge dans les années* 1828-1830. Amsterdam, Diederich frères. A Dutch translation, 1832.] A. F. v. L.

HOLDER OF A BILL OF EXCHANGE. The Bills of Exchange Act, 1882, defines a holder of a bill of exchange or promissory note as the "payee and indorsee who is in possession of it or the bearer"; and further defines a "holder in due course" as a holder "who has taken a bill complete and regular on the face of it under the following conditions: namely (*a*) that he became the holder of it before it was overdue, and without notice that it had previously been dishonoured, if such was the fact; (*b*) that he took the bill in good faith and for value, and that at the time the bill was negotiated to him he had no notice of any defect in the title of the person who negotiated it" (§ 29). A holder may sue in his own name, and if he is a "holder in due course," a defect of title in any of the prior parties does not affect his right, nor can any right of set-off or counterclaim available against any other party to the bill be exercised against him. If a holder, whose title is defective, obtains payment of the bill the person who pays him in due course is validly discharged (see § 38). If, for instance, a person steals a bill endorsed in blank, and obtains value for it from another person, who has no notice of any irregularity, the purchaser is entitled to payment, being "the holder in due course"; also if the thief obtains payment from the acceptor, the latter not having had any notice of the theft, he gets a valid discharge, having paid it to the "holder." It should, however, be pointed out that a person holding a bill, the chain of indorsements on which is interrupted by a forged indorsement, according to English law is not a "holder" in any sense, and is not entitled to payment though he gave value for the bill; also that a payment to a person holding such a bill is not a valid discharge—the only exception being payment in good faith by a banker of a bill payable on demand. English law, in this respect, materially differs from the law of other countries. According to German, Austrian, and Italian law a person, otherwise in the position of a holder in due course, is entitled to sue the acceptor and genuine indorsers though one of the indorsements through which he derives his title is not genuine (German Bill of exchange code, §§ 36, 76, see decision of supreme mercantile court reported Reichsoberhandelsgericht, vol. ii. p. 281; Italian Codice di Commercio, §§ 287, 327). French law confers no rights on the holder of such a bill, but declares the drawee discharged if he has paid the holder without having had notice of the loss of the bill (Code de Commerce, §§ 144, 149). As, according to § 72 of the English Act, the validity of an indorsement depends upon the law of the place where it was made, the provisions of foreign law referred to above may

frequently become applicable in the case of bills of exchange payable in England, and materially affect the rights of the holders of such bills. E. S.

HOLDINGS OF LAND (FLUCTUATIONS IN SIZE AND THEIR ECONOMIC EFFECTS). During the greater part of our history England has been a country of small agricultural holdings, though of large estates. In all probability there was little change in the distribution of land among the cultivators from Anglo-Saxon times until the 15th century, and it was not until the 18th century was well advanced that large holdings, except for sheep-farming, became common. Seebohm (*English Village Community*, p. 141) gives evidence to show that peasants before the conquest held land in parcels of the same size as those held by their successors under the Normans; a virgate or 30 acres (exclusive of pasture, wood, and waste) may be taken to have been the average, perhaps the normal, holding of the higher class of serf—the *villanus*, while the lower sort, the *bordarius* or *cotarius*, commonly held about 5 acres. Round thinks that pasture was allotted in the proportion of a little more than 3 statute roods to an acre of arable (*Domesday Studies*, 1888, vol. i.). The lord's demesne too, which may generally have comprised from a quarter or a third to a half of the manor (Brodrick, *English Lands and English Landlords*, 1881, p. 8, and Ashley, *Economic Hist.*, i. pt. 2, p. 267) was often let off to free tenants, whose holdings were considerably larger than those of the serfs. Sir H. Ellis's classification (*Introduction to Domesday*, vol. ii. p. 511) gives

Unfree Holders or Serfs.	Free Tenants.
82,609 *bordarii*	10,097 *liberi homines*
1,749 *cosceti*	2,041 ,, *commendati*
5,054 *cotarii*	
108,407 *villani*	23,072 *sochemanni*
369 *radmanni*	
749 *bovarii*	

If it is remembered that about a quarter of the arable land in the country was probably kept in the lords' hands, and that Northumberland, Cumberland, Westmoreland, Durham, and Lancashire, besides Monmouthshire and Wales, were not included in the survey of 1086, a rough idea may be formed of the proportion of the cultivated land of the country held by the different classes of cultivators. In Middlesex alone was any attempt made by the Domesday commissioners to record the size of the holdings as well as the number of holders; elsewhere the villeins were taken, not individually, but by classes.

Little change probably took place in this system before the Black Death of 1349, or even, according to Professor Ashley, before 1450 (*Econ. Hist.*, vol. i. pt. 2, p. 264); and it is very difficult to trace the progress or estimate the amount of such change as there was. The destruction of something like half the people by the Black Death, the frequent wars, the attractions of growing towns and of an extended trade, must all have helped to thin the rural population; but the central fact is the rapid increase of sheep-farming to meet a growing demand for English wool, and to avoid the expense of arable cultivation when labour was scanty and dear. From this time it is necessary to consider pasture and arable land separately, and the problem becomes more difficult. There is no doubt that the frequent enclosures of the end of the 15th and the first half of the 16th centuries affected both arable and pasture land, and that one result of the agrarian change was to consolidate some small holdings into larger ones; but many of the lands enclosed for sheep-farming were the demesne lands in the hands of the landlords. The legislative attempts to guide or check the change give some indication of its extent; *e.g.* an act of 4 Hen. VII. forbade farmhouses with 20 acres of arable to be pulled down; an Act of 24 Hen. VIII. ordered the keeping up of all farms from 30 to 50 acres, and an Act of the next year limited sheep-farmers to 2000 sheep, which would mean a legal maximum farm of about 500 acres. (The extent of the enclosures between 1470 and 1600 is roughly estimated with a map in Ashley's *Econ. Hist.*, i. pt. 2). There is abundant contemporary evidence that great numbers of the small farms disappeared, but there is no means of calculating how many remained; or in what proportion the land was divided among landlords cultivating their own demesne, freeholders, leaseholders, and copyholders; or what was the acreage held, collectively or individually, by any of these classes. Nor can the total population during this period be exactly stated. It is reckoned that it amounted to 2,000,000 at the time of the Domesday Survey; in 1377, twenty-eight years after the Black Death had destroyed one-third or perhaps one half of the people, 1,405,602 persons over fourteen years of age paid the poll-tax; in 1574-75 the roll of fighting men numbered 1,172,674.

With the 17th century our information becomes rather more definite, but is founded only upon contemporary estimates, not till the 19th century upon statistics.

Gregory King, writing in 1696 (*Natural and Political Observations and Conclusions*), estimates the numbers of the landed classes as follows:—

160 temporal lords	12,000 gentlemen
26 spiritual ,,	10,000 clergymen
800 baronets	40,000 freeholders
600 knights	140,000 ,,
3000 esquires	150,000 farmers

The whole country population he puts at 4,100,000, the town population at 1,400,000. In the former class leaseholders and copyholders are possibly reckoned together, the freeholders being separately counted, perhaps because they possessed the parliamentary franchise — certainly not because of any superiority in the size of their holdings, for the forty-shilling freeholder need not have possessed much land after the cheapening of silver from the discovery of American mines. As enclosures and other agrarian changes probably took place but slowly during the latter part of the 16th century and throughout the 17th, King's estimate may be taken to hold roughly good for the reign of Elizabeth. But it is not wholly trustworthy; the number of freeholders is generally considered too high (Gneist, *Eng. Const.*, vol. ii. p. 328; Toynbee, *Industrial Revolution*), and 150,000 can hardly account for all the non-freeholders who held land. For the copyholders had been numerous on every manor throughout the four centuries following Domesday, and cannot have decreased so fast as King's numbers would imply; and the tenant farmers had been a growing class since most lords of the manor gave up cultivating their demesne in the 14th and 15th centuries.

The annexed table shows the difference between the estimates made by Gregory King and those of Arthur Young about a hundred years later. Unfortunately the first applies to England and Wales, the second to England only.

Authority.	Date.	Population.	Acreage under cultivation.	Holdings.	
Gregory King .	End of 17th century	5,500,000[1]	Arable 11,000,000 Pasture 10,000,000	70 Acres and under, 200,000	Over 70 Acres, 4,000
Arthur Young .	End of 18th century	8,675,000	Arable 16,000,000[2] Pasture 16,000,000	Farmers, exclusive of those employing no labour, 2,800,000	

During the 18th century the process which converted England from a land of small to a land mainly of large holdings was carried on more quickly. The rise of a moneyed class desiring the political influence which was the monopoly of landowners created a demand for land, and at the same time supplied the capital without which enclosures and the other expensive agricultural improvements of the day could not be carried out. This was the second period of active enclosing, not now, as in the 16th century, mainly for sheep-farming, but for the conversion of the scattered arable strips in the mediæval common fields into separate farms enclosed with hedge or fence. Between 1710 and 1760 334,974 acres were enclosed (Toynbee, 1887, p. 38), and 7,350,577 more were enclosed between 1760 and 1849 (Porter, *Progress of the Nation*, 1851, p. 157). Much of this was of course waste land never before cultivated. Various opinions have been held as to the time and the speed at which the small freeholders disappeared; some causes for their disappearance are at any rate clear. Dr. Cunningham (*Industry and Commerce*, ii. 478) says "that the pressure of poor-rates was the determining cause which rendered the yeomanry willing to sell, while the high prices of the last year of the [French Revolution] war gave them the opportunity of selling advantageously." It is certain too that the decay of domestic industries after the great mechanical inventions of last century took from the less prosperous of the small farmers their only means of eking out a scanty living. Yet Arthur Young's language often implies the disappearance of many of these small freeholders before his day, and Arbuthnot, writing in 1773, regrets "the loss of that set of men who were called yeomen," though, while protesting, with Dr. Price, against great estates, he cordially approves of large farms (*Inquiry into the Connection between the Present Price of Provisions and the Size of Farms*). It is, however, important to notice that Arbuthnot, in defending large farmers against complaints of their comparative unproductiveness, takes 100 and 300 acres as typical instances of small and large farms respectively. It was in Norfolk, Essex, and on the Wiltshire Downs that Arthur Young, when on his tours, found the largest farms. Of 250 farms described by him in the North the average size was 284⅔ acres.

The 19th century has intensified the changes of the 18th. In 1833 small proprietors were selling even in Kent; speculation in land during the high war prices had led very generally to borrowing, and, when the unforeseen fall of prices came, to the ruin of many small landowners and the transfer of their land to more wealthy proprietors (*Report of Select Committee on Agriculture*, 1833, pp. x. 195). The first return of the number and size of agricultural holdings was obtained in 1880; for the "*New Domesday Book*"—the *Return of Landowners* of 1873—made no attempt to distinguish between estates and farms. The census, however, of 1851 (see *Encyclopædia Britannica*, 8th edition, art. "England"), carries our statistical information on the point farther back, but it is probably less exhaustive than later returns, particularly for small holdings.

[1] According to Finlaison's calculation for 1700, 5,184,516.

[2] Couling, in 1827, estimated that 25,632,000 acres were cultivated in England about 1801, and 3,117,000 in Wales.

The following table shows the statistics of recent years; it applies throughout to England and Wales. The size of 2558 farms was not stated in 1851.

It is clear that England is not even now wholly cultivated by large farmers, and that small holdings have of late shown a tendency to increase again. But some at any rate of the causes which produced large farming are still active, and some laws and legal customs combine with social and economic conditions (see CULTURE, LARGE AND SMALL; CONVERSION OF ARABLE INTO PASTURE; FARMING;) to make anything like peasant farming difficult in England. The expenses of conveyancing add appreciably to the sum required for purchase, especially in the case of small parcels of land (see Torrens, *Transfer of Land by Registration*, Cobden Club Essays, p. 38, and Kay, *Free Trade in Land;* but for another view, Jevons, *Fortnightly Review*, Mar. 1881). The development of "small culture," such as market-gardening, may be balanced against these adverse conditions, and allotment legislation (see ALLOTMENT) is a sign of reaction against the accumulation of the land in few hands.

The economic effects of the fluctuations in the size of agricultural holdings cannot easily

Date.	Population.	Acreage under cultivation.	Number of occupiers.	100 acres and under.		100 to 300.	300 to 1000.	Over 1000.	Average size of holdings.

1904	(1901) 32,526,075	Arable 11,761,090 Pasture 15,667,882	432,327	(1 to 5) 91,485	(5 to 50) 198,514	(50 to 300) 125,986		(over 300) 15,342	Eng. 66·2 Wales 46·4

be isolated from the results produced by other factors than mere size; and there has been no time when contemporary opinion was not divided upon the point. But the best writers have generally agreed as to the value of enclosures, which, from the 16th century at any rate, may be considered as *implying* the amalgamation of small holdings. Fitz-Herbert (*Surveying*) said in 1523 that if an acre of meadow "lie in severalty it is worth half as much again" as if "it lie at large in the common meadows." Tusser in 1557 strongly approved of enclosing not only pasture but arable:

"Good land that is severall, crops may have three,
In champion country it may not so be."

i.e. one-third of the champion land must lie fallow (*Five Hundred Points of Good Husbandry*, *Somers Tracts*, 1810, ch. 17). Blith, in 1649, alluding to enclosed pasture, speaks of the "disproportion betwixt the profits of one lordship in common, and the next adjoining to it inclosed. The one worth three hundred pounds in common, the other neere a thousand in pasture" (*The English Farmer*, p. 35). Fortrey in 1663 made the same calculation of comparative values. In the 18th century Arbuthnot in 1773 defended large farms against the charge of comparative unproductiveness by arguing that farmers of only 100 acres could not afford to keep the proper number of labourers and of horses, and that an arable farm of 300 acres employed more men than three 100-acre farms. Adam Smith believed that "after small proprietors, rich and great farmers are in all countries the greatest improvers." (*Wealth of Nations*, ed. M'Culloch, p. 76). Arthur Young, while alluding to contemporary complaints against large farms as depopulating and as raising prices, emphasised their connection with the expensive enclosures of his day: "How, in the name of common sense," he asked, "were such improvements to be wrought by little or even moderate farmers! Can such enclose wastes at a vast expense—cover them with an hundred loads an acre of marle? . . . No. It is to *GREAT FARMERS* you owe these" (*Political Arithmetic*, p. 155). Writers of this century are still divided, but perhaps the balance of expert opinion at the present time inclines, for England, to large farms with a moderate sprinkling of very small ones, not for corn or sheep, but for dairying, fruit-growing, and market-gardening.

HOLIDAYS. The term holiday now signifies little more than a day on which no work is done. But the etymology points to the fact that particular days have been reserved from the performance of labour, usually from a religious motive. All religions have set apart certain days for the performance of religious duties. These duties, whether external as in the case of sacrifice, or internal as in the case of prayer and meditation, have always been deemed to require the undivided attention of those who wish to discharge them, and attention cannot be concentrated upon any act without an interval of leisure longer than is needed for its bare performance. The mind must be disconnected, as it were, from ordinary occupation before it can be devoted entirely to religious duties. The feeling of compassion, too, which may be traced in all the religions of civilised men, has tended to multiply occasions of rest and of enjoyment. In all the more primitive religions the rites necessary to express piety and conciliate the higher powers have been so many and complex that the holidays required for worship have also sufficed for rest. Such was the case with the nobler forms of polytheism, as in ancient Greece or Italy. Such also is or was the case with the Latin and Greek churches. Under these circumstances the demand for holidays merely as opportunities of rest does not occur. But in communities professing a simpler form of Christianity, or little influenced by religious feeling, the proportion of time set apart for religious observances is shorter. Strict Protestants have absolutely condemned all secular occupations on Sunday, but, with the reservation of Sundays, have left the whole year for labour. Hence a demand for holidays not of a religious character has been made by modern philanthropists and has been partially conceded, as in this country by Sir John Lubbock's Act creating four bank holidays in each year.

Considered merely on economic grounds, the necessity of a certain number of holidays in every year cannot be denied. It is proved by an overwhelming induction that incessant labour does not yield the largest net product. As productive labour cannot be continued for the whole twenty-four hours, so neither can it be continued for all days in the year. Moreover all reasonable economists will allow that welfare as well as wealth is desirable, and that even the greatest possible production of wealth in a given time would be too dearly bought by degeneration. But no absolute rule can be laid down as to the number of days in the year which should be reserved from industry. In different cases different periods of leisure are determined by difference (1) in national temperament; (2) in the character of occupations; (3) in the use generally made of holidays. Thus as regards (1) national temperament, certain races evolve an exceptional amount of energy in a given time, and so require longer periods for the restoration of vital force, whilst others evolve energy more slowly but more continuously, and so require more time to produce the same result. A comparison of the Englishman with the Hindu or Chinaman would probably illustrate this difference. (2) Difference in the character of occupations. Tending the machinery of a modern cotton mill is a more exhausting occupation than guiding a plough, and the occupation of the poet or the discoverer is more exhausting than the care of machinery. Purely intellectual occupations in the case of those who follow them assiduously are carried on more or less involuntarily. Much of the highest and most fruitful thinking may be described as unconscious cerebration. The born lawyer is for ever thinking over cases, the born inventor over mechanical improvements. This kind of labour is therefore not only intense but also difficult for the labourer to arrest. Even prolonged leisure may not give him repose unless accompanied by change of climate, scenery, or society. On the other hand the ploughman's labour ends when the plough stops, the bricklayer's when he has laid the last brick of the day. Thus it may be affirmed that the more intellectual the labour, the longer should be the intervals of rest. (3) The difference in the use generally made of holidays,—a holiday may be spent in a great variety of ways, each with a different economic result. It may be spent (*a*) in mere debauchery, in which case the cost of the holiday is great and the result of the holiday is diminished power of production; or (*b*) in wholesome pleasure; or (*c*) in mere vacancy, which, except for the overworked, is comparatively unprofitable; or (*d*) in religious and domestic quiet, as in the English Sunday at its best, with

the result of strengthening and concentrating character. The renewal of energy, the consolidation of character, are all of direct economic value; and the holiday which contributes in due proportion to all is the best holiday in an economic sense.

It is therefore clear that no rational economist will lay down any absolute rule as to the number of days in each year on which productive labour should be intermitted. He will only say that every class of producer should have as many holidays in the year as are necessary to the highest efficiency, which implies (1) that the faculties are fresh and vigorous, (2) that the habit of industry has not been enfeebled by too many or too long intervals of idleness. These conflicting considerations can be balanced only after an independent experimental inquiry for every calling.

[*Blue Book on Sunday Rest in Various Foreign Countries.* See remarks of Petty and Cantillon on the economic advantages of Protestantism as wasting fewer days in holidays than Roman Catholicism.] F. C. M.

HOLLAND, JOHN (*d.* 1722), the organiser and perhaps the founder of the Bank of Scotland, was a merchant of the STAPLE (Munk, *Roll of Roy. Coll. Phys.*, ii. 92), and connected with the East India Company. This may be gathered from his own words, for he says in reply to a statement that the East India Company's cashiers' notes passed currently in payment for the company's use that he "never saw or knew of such notes, although I was about eight years almost every day conversant in that Business, and for several years since, have had opportunity to know the Affairs and Methods of that Company" (*Discourse*, introduction). Elsewhere he mentions that he was sworn to the English East India Company (*ib.* 13). In 1693 he and several Scotch merchants in London obtained for seven years an exclusive right to manufacture in Scotland "Colchester Baises, and all other sort of Baises, which Baises will consume a great deall of wooll which cannot be otherways profitable" (Acts of Parl. of Scotland, ix. 313). Soon afterwards he and four others made various proposals to William III. for starting a bank and for supplying the government with money, but they came to nothing (*Ruine of the Bank of England*, 4, 5). In 1695, being requested by a Scotch friend to draft a scheme for a bank for Scotland, he with some hesitation did this, and his views were incorporated in the act "for erecting a publick Bank," passed July 1695, which authorised the creation of a bank possessing exclusive banking rights in Scotland for twenty-one years (Acts Parl. of Scotland, ix. 494). This institution differed in kind from any existing banks, for it was the "first instance in the world of a private joint-stock bank, formed by private persons, for the express purpose of making a trade of banking, dependent on their own private capital and wholly unconnected with the State" ("Banking in Scotland" in Macleod's *Dict. Pol. Econ.*, 124). And to Holland the credit of originating the idea as well as of drafting a workable scheme is in all probability due. Burton (*Hist. Scotland*, viii. 67) regards him as the organiser rather than as the founder of the bank, but gives no definite reason for his opinion. Holland and four of his associates in the baise manufactory—it would be interesting to know whether they were the four above mentioned—were among those empowered to receive the subscriptions, which were quickly taken up. In 1696 he was chosen as the first governor of the bank which he was invited to organise, being at his "own charge and expense," with the prospect of $\frac{1}{10}$ of any profits which might remain after the payment of 12 per cent interest to the subscribers (*Discourse*, 5). He was a gainer by the bargain, and speaks warmly of the justice and generosity which prevented him from losing by his work (*Ruine*, 6). He had to face great difficulties at the outset, for the Scotch knew nothing about banking, and only after some opposition did Holland succeed in obtaining the sanction of the directors to his suggested rules. He was exceedingly anxious that the rate of interest should be kept low, and that every facility should be given to borrowers, but his proposal that the statutable rate (6 per cent) should be reduced to 4 per cent met with much opposition. The African Company, in defiance of the privileges of the bank and with the object of ruining it, almost immediately set up the trade of banking as one of its many departments of work; but the discretion displayed by Holland and the directors enabled them to tide over the crisis until the collapse of the company left the bank without a rival. Holland, writing in 1715, states that though he had left off business for about twenty years, he could yet spend a good part of his time in doing the business of a bank, and that though living a perfect country life, he spent some time in contriving schemes which might be for the public good (*Ruine*, 6). And from his letters it would seem that his advice was sought in emergencies by the directors of the Bank of Scotland. In 1715 he brought forward a proposal for starting a company which should lend "money on land and for the relief of the poor of the kingdom" (*Directors of the Bank of England*, 6). The rate of interest was not to exceed 4 per cent, and as the possible lowering of the bank rate which might result might be an objection to those interested in the bank, Holland wrote various pamphlets and letters indicating the advantages of a low rate to the nation, and pointing out the ruin which, he considered, must overtake the Bank of England unless it modified its policy. A scheme and rules for the management of a bank in Ireland were also drafted by him and his son

Richard. He died at Brewood Hall, his residence in Staffordshire.

John Holland is known to have written the following pamphlets:—*A Short Discourse on the present temper of the Nation with respect to the Indian and African Company, and of the Bank of Scotland. Also of Mr. Paterson's pretended Fund of Credit* (1696).—*The Ruine of the Bank of England and all Publick-Credit inevitable, and the necessity, in a short time, of stopping the payments upon the several Funds to the Bank, South Sea Company, Lotteries, etc., if the Honourable House of Commons will not themselves be Judges of the means that may be offer'd to prevent it* (1715).—*The Directors of the Bank of England Enemies to the Great Interests of the Kingdom, and also not just to the trust reposed in them by the Adventurers, who chose them to do their best Endeavours, by all honest Means, for the Advantage of the Joint Stock* (1715).—*Some Letters relating to the Bank of Scotland* were published with explanatory remarks in a letter to the Proprietors, by his son Richard Holland in 1723.

(1878).—Lawson, W. J., *History of Banking* (1850).—Macleod, H. D., *Dictionary of Pol. Economy* (1863).—Burton, J. H., *Hist. of Scotland*, viii.—*Historical Account of the Establishment, etc., of the Bank of Scotland* (1728).] E. A. M.

HOLOGRAPH. A term applied to a "deed" or writ written, wholly or in the essential parts, with the granter's own hand. A holograph document, such as a will in the testator's own handwriting, is held in Scots law as well as in French law, and the systems of law derived from French law, to be valid without witnesses. A document may be proved by extrinsic evidence to be a holograph one; and if it is stated in the body of it to have been written by the granter, the presumption of law is that it is so. But a holograph writing, other than a will or a mercantile document written in the course of trade, does not of itself prove its own date where the date is in dispute or of importance; this may be proved by other means. A. D.

HOME INDUSTRIES. This is the older form of industrial occupation, which was gradually, and not without much irritation, superseded by the FACTORY SYSTEM. In contradistinction to the latter, it may be accurately and simply described in the following words, which are taken from the report of the committee of the House of Commons on the woollen manufacture of England, 1806. "In the domestic system, . . . the manufacture is conducted by a multitude of master manufacturers, generally possessing a very small, and scarcely ever any great extent of capital. They buy the wool of the dealer; and, in their own homes, assisted by their wives and children, and from two or three to six or seven journeymen, they dye it, when dyeing is necessary, and through all the different stages work it up into undressed cloth."

Up to the time when the factory system began to be practised, all the industries may be said to have been of this nature. The prevailing feature of the system is the existence of the small capitalist, who provides work and livelihood only for himself and a meagre supply of subordinates. This system produced the crafts and GILDS (see also CORPORATIONS of ARTS AND TRADES) of the middle ages; and the questions of capital and labour to which it gave rise are exemplified in the famous statute of apprentices in our own country (see APPRENTICESHIP, STATUTE OF). It was undermined when the great inventions of last century, and the extension of the principle of division of labour, gave rise to the great organisations of workmen and the concentration of labour power. The savings effected by the large capitalist forced the small capitalists to compete in the only way open to them, viz. by combining their capital and forming one large unit in place of many small ones. Hence the progress of JOINT-STOCK COMPANIES, and the legislation of the present century for facilitating the formation of these. Notwithstanding this process of elimination, there are many scattered survivals of the older system, especially in the textile industries. As an economic system, that of the handicrafts is historically very interesting; from a social standpoint it contrasts in many ways so favourably with the factory system that many are inclined to regret its decadence and virtual annihilation in England.

HOMESTEAD AND EXEMPTION LAWS OF THE UNITED STATES. *Definition.*—Homestead is the house and land constituting a family residence. In law it is such residence exempt from forced sale.

Provision for the exemption of homesteads from levy for the payment of debts was not made in the common law, but is entirely statutory, being made on grounds of public policy only, because it is not well for the state that a family be deprived of its home: it should be protected against alienation of the home, especially through the improvidence or misfortune of the head of the family. Not only is such legislation modern, but it is even of recent date. The first law on the subject found in America was approved 26th January 1839, in Texas, at that time an independent republic,

At present, out of the forty-four states, four territories, and the district of Columbia, sixteen of the states have constitutional provisions for the exemption of homesteads, and all of them, with the exception of Delaware, Rhode Island, and the district of Columbia, provide for such exemption by statute. All of them exempt a certain amount of personal property, including primarily wearing apparel, furniture, tools, library, cattle, etc. Naturally the details of the laws vary much in the different states. Always the legal possessor of a homestead right must be the head of a family. Usually the owner of the homestead must be living on the property in question,—although in the state of Texas and in some few others the homestead right may be obtained as soon as the property is improved, so that the intent of acquiring a residence thereon is clear. In some states the homestead right is assumed from the fact of the head of a family occupying the property with his family. In other states the property so claimed for exemption must be openly declared at the time the property is made the homestead; and in still others there must be a recorded claim to the homestead in order to give it the right to exemption. The nature of the claim is that of an estate for life, although the wife and children of the owner have also an estate of inheritance, the children's rights lasting until they become of age. In some states, in order to give a clear title to the property if it is sold or mortgaged, the wife must freely sign the deed or the mortgage; and in some cases mention must be specifically made of the fact that by so doing she gives up her homestead rights. This provision has at times been used for fraudulent purposes, the wife signing the mortgage, but not specifically mentioning the homestead. Time and court decisions will, however, remedy such defects. The exemption of the homestead from sale on account of debts is not a complete one. In no case is the homestead claim good as against the state itself on a claim for taxes. Generally the right does not extend to exemption for payment of a debt made to purchase the property itself, nor against a mechanic's lien upon the property, nor to debts already existing when the estate was bought. The amount of the exemption varies greatly in the different states. In Maryland the value of the estate which is exempt, whether real or personal property, is limited to $100 (£20); whereas in Texas, California, North Dakota, South Dakota, and in some of the other states the value of the property exempted may amount to $5000 (£1000). In some of the states the amount of personal property that is exempt from levy is fixed; but the homestead may be a certain lot of ground,—for example, in Minnesota 80 acres or less in the country, or one lot to one half-acre in city or town; and in Kansas 160 acres in country, or 1 acre with improvements in town, regardless of its value. Under this law, if the homestead occupied but one lot of ground in a city, it might be almost palatial in nature and of great value, and still be exempt from levy. In Wisconsin and Iowa equal liberality is shown. In some of the newer states great hardship has often resulted from the fact that creditors could not collect from well-to-do debtors sums due to them, because they had been invested in a homestead. The rule of construction of the homestead and exemption statutes varies in the different states. For example, in Louisiana and Minnesota the construction is strict, the courts holding to the letter of the law; whereas in many of the other states—as, for example, in Michigan—the courts have decided that the construction of the law, on a number of grounds of public policy, should be liberal, and in favour of the owner of the homestead rather than of the creditor.

In the statutes of the federal government the expression Homestead Laws applies to the laws of congress which have provided for the free settlement of the public lands. Under the law of 20th May 1862, "every person who is the head of a family, or who has arrived at the age of twenty-one years, and is a citizen of the United States, or who has filed his declaration of intention to become such, as required by the naturalisation laws, shall be entitled to enter one quarter-section (160 acres) or a less quantity of (certain) unappropriated public lands," and file a homestead claim upon the lands. If he lives upon these lands and makes due improvements for five years, he may receive a clear title to the lands from the United States upon the payment of a small registration fee of 5 or 10 dollars (£1 or £2). If, after he has resided upon the land for three years, he can show that one acre out of every sixteen has been planted with trees, cultivated for not less than two years, and set not over twelve feet apart each way, he may at that time get a patent to his land without waiting for the expiration of the full period of five years. At any time before the expiration of the five years provided by law he may receive his patent upon the payment of the $1.25 (5s.) or the $2.50 (10s.) per acre provided under the regular pre-emption law. It is also provided in this homestead law that no such homestead shall become liable to the satisfaction of any debt contracted prior to the issue of the patent therefor. Under this homestead and pre-emption law nearly all of the free public domain of the United States has been already taken by actual settlers, to the great benefit of the country. To this law has been due, in great part, the immigration of the best of the foreign element now in the United States, as well as the enormous increase in the value of the western lands, and

the rapid advance in wealth and culture of the western states.

[The leading authorities on Homestead and Exemption laws in the United States are: Rufus Waples, *The Law of Homestead and Exemption*, 1893; Seymour D. Thompson, *On Homesteads and Exemptions*, 1878; and J. H. Smyth, *Homesteads and Exemptions*, 1875.—A very careful and complete discussion of the subject is found also in Washburn, *On Real Property*, 1887.—Of course the final authority must always be the statutes of the individual states and the legal decisions thereupon.]

The following table contains a very brief digest of the exemptions of real property and personal property in all of the states and territories of the United States, excepting Alaska. The table is modelled after the one prepared for Lalor's *Cyclopedia of Political Science, Political Economy, and of the Political History of the United States*, published in 1883; but it has been entirely revised and brought down to date, 1st January 1895. J. W. J.

States.	Real Property Exemption.	Personal Property Exemption.
Alabama	Homestead worth $2000 (£400) 160 acres in country, or one lot in city.	$1000 (£200) of personal property, wearing apparel and other articles.
Arkansas	Homestead to head of family of value of $2500 (£500) 160 acres in country or 1 acre in city, or at least 80 acres in country or one-fourth acre in city regardless of value.	To amount of $200 (£40) and clothing, if unmarried, or $500 (£100) and clothing to heads of families.
California	Homestead worth $5000 (£1000) to head of family, or $1000 (£200) to any person.	$200 (£40) worth of furniture and a multitude of special articles, and life insurance moneys where the annual premium did not exceed $500 (£100).
Colorado	Homestead not over $2000 (£400) in value.	Furniture $100 (£20) stock in trade to amount of $200 (£40) and various articles.
Connecticut	Homestead worth $1000 (£200).	Library, etc., $500 (£100); cattle, etc., $300 (£60) and wearing apparel to any person; to head of family:—many specific articles; horse, etc., $200 (£40) to physician; $200 (£40) boat, etc.
Delaware	No real estate exemption.	$75 (£15) tools, etc.; and books to any person; to head of family $200 (£40) worth of personal property additional; in Kent Co. $50 (£10) worth of tools to any person, and $150 (£30) worth of personal property to head of family; sewing machine.
Florida	160 acres of land in country, or ½ acre and residence in town.	To amount of $1000 (£200).
Georgia	Real estate or personalty to the value of $1600 (£320).	Real estate or personalty to the value of $1600 (£320).
Idaho	Homestead worth $5000 (£1000) to head of family, or $1000 (£200) to any person.	Desks, etc., $200 (£40); cabin of miner, etc., $500 (£100); life insurance moneys where premium did not exceed $250 (£50); library, etc., of physician, attorney, etc.; many other articles.
Illinois	Residence worth $1000 (£200) to a householder with family.	To any person $100 (£20) personal property; to head of family, $300 (£60) worth; to all wearing apparel, etc.
Indiana	To each householder $600 (£120), real or personal, or both.	Property real or personal to the amount of $600 (£120).
Iowa	Homestead to head of family of 40 acres in country or ½ acre in city or town, of the value of at least $500 (£100).	Presses, etc. of newspaper, $1200 (£240); household furniture, wearing apparel and many other articles; life insurance money to a beneficiary to amount of $5000 (£1000).
Kansas	160 acres in country, or 1 acre with improvements in town; value not limited.	$500 (£100) furniture; tools, etc. $400 (£80); stock, food, etc. $300 (£60); and other articles to head of family; to other person—tools, etc. $400 (£80) and other articles; pension money for three months.
Kentucky	Land with dwelling to value of $1000 (£200) to a householder.	$100 (£20) furniture, clothing and domestic animals.
Louisiana	Homestead and personal property limited to $2000 (£400).	Homestead and personal property limited to $2000 (£400).

States.	Real Property Exemption.	Personal Property Exemption.
Maine	Land and dwelling, value $500 (£100), to a householder.	$50 (£10) furniture, $150 (£30) library, $300 (£60) farm animals, clothing, tools, etc.
Maryland	Real or personal property of value of $100 (£20).	Wearing apparel, books, and many other articles.
Massachusetts	Homestead to value of $800 (£160) to householder having family.	$300 (£60) furniture; tools, etc. $100 (£20); stock, etc. $100 (£20); boat for fishing, $100 (£20); $100 (£20) sewing machine; and many other articles.
Michigan	40 acres in country, or city lot and residence to value of $1500 (£300).	$250 (£50) furniture, $250 (£50) stock in trade, $150 (£30) books, farm animals and minor articles; where judgment is for work, labour or services, not professional, only $500 (£100) worth of personal property is exempt.
Minnesota	Homestead to householder with family, 80 acres in country, or one lot to ½ acre in city or town.	$500 (£100) furniture, etc.; animals, etc.; $300 (£60) tools, etc.; $400 (£80) presses, etc. of newspaper; $2000 (£400) and $400 (£80) worth of stock in trade; and many other articles.
Mississippi	Homestead to householder with family, 160 acres in country, or residence, etc. in city of value of $2000 (£400).	$250 (£50) personal property or specific articles; library, $250 (£50); instruments, etc., $250 (£50), life insurance moneys $10,000 (£2000) to beneficiaries or $5000 (£1000) to executor or administrator for benefit of heirs or next of kin.
Missouri	160 acres, worth $1500 (£300) in country, or buildings in city to value of $1500 (£300) to $3000 (£600).	Furniture $100 (£20), provisions $100 (£20), domestic animals $150 (£30); or in lieu of all specified, $300 (£60) net exemptions.
Montana	Homestead to householder of 160 acres or ½ acre in city or town, of value of $2500 (£500).	Farming tools, etc., $600 (£120); $100 (£20) books, etc.; cabin of miner with appliances $500 (£100); articles specified.
Nebraska	Homestead not exceeding $2000 (£400) in value.	$500 (£100) exempted when no real estate is owned, and pension money or property purchased or improved with it to value of $2000 (£400).
Nevada	Homestead to head of family to value of $5000 (£1000) in gold coin.	Chairs, etc., $100 (£20); cabin of miner $500 (£100), and $500 (£100) tools, etc., $100 (£20) sewing machine; library, instruments, etc.; many other articles.
New Hampshire	Homestead worth $500 (£100), or so much thereof as does not exceed $500 (£100).	$100 (£20) furniture, $200 (£40) in library, $100 (£20) in tools, $50 (£10) in fuel and provisions, clothing, domestic animals.
New Jersey	Homestead to amount of $1000 (£200) to householder.	To amount of $200 (£40) and clothing.
New York	Homestead to value of $1000 (£200) to householders.	$250 (£50) in furniture, mechanics' tools, instruments, library, etc.
North Carolina	Homestead to value of $1000 (£200) to occupant of an estate.	To value of $500 (£100).
North Dakota	Homestead of value of $5000 (£1000) to head of family.	$100 (£20) books, etc.; wearing apparel; and $1500 (£300) worth of personal property additional.
Ohio	To amount of $1000 (£200) to heads of families only. If homestead sold under prior lien, $500 (£100) paid to widow or heirs.	Clothing, furniture, tools, etc., or $500 (£100) additional exemption if no real estate is owned.
Oregon	Homestead of 160 acres in country or one block in city or town, of value of $1500 (£300), or at least 20 acres in country or one lot in city or town regardless of value.	$300 (£60) in furniture, $100 (£20) clothing, or $50 (£10) for each member of family, $400 (£80) tools, etc.; farm animals.
Pennsylvania	Property, either real or personal, to the value of $300 (£60).	$300 (£60) value of property, either real or personal, besides wearing apparel; where the judgment is for wages of $100 (£20) or less, or board for four weeks or less, no exemption is allowed.

States.	Real Property Exemption.	Personal Property Exemption.
Rhode Island	No real estate exemption.	$200 (£40) tools, etc.; $300 (£60) furniture, etc.; books, etc., $300 (£60); many other articles.
South Carolina	Homestead worth $1000 (£200).	$500 (£100) worth of personal property.
South Dakota	Homestead to head of family of 160 acres in country or house and lots in city or 1 acre in city or town, of value of $5000 (£1000).	Books, wearing apparel, etc., to any person; to head of family $750 (£150) additional; to any person $300 (£60) additional; or in lieu thereof:—Books, etc., $200 (£40); $200 (£40) furniture; cattle, waggons, stock, etc., $1250 (£250); library, etc., $300 (£60).
Tennessee	Homestead worth $1000 (£200).	Clothing, furniture, and a long catalogue of miscellaneous articles.
Texas	200 acres with house in country, or lot worth $5000 (£1000), and residence in town, to a family.	Furniture, tools, and many other articles.
Vermont	Homestead worth $500 (£100) to any housekeeper.	Clothing, furniture, farm animals, and sundry stores, $250 (£50) in teams, $200 (£40) professional library, and tool chest of mechanic.
Virginia	$2000 (£400) in real or personal property to head of a family.	Clothing, furniture, library, domestic animals, besides $2000 (£400) real or personal.
Washington	Homestead to householder of value of $1000 (£200).	Wearing apparel; $500 (£100) private library; to householder; $500 (£100) furniture, etc.; cattle, etc., or $200 (£40) personal property; $500 (£100) farming utensils; $500 (£100) tools; $200 (£40) instruments of physician and $500 (£100) library; library of attorney or other professional man $1000 (£200) and $200 (£40) of furniture.
West Virginia	Homestead worth $1000 (£200) to head of a family.	Personal estate not exceeding $200 (£40) in value.
Wisconsin	40 acres with house in country, or house and ¼ acre in town.	$200 (£40) furniture, etc.; $200 (£40) farming utensils; $200 (£40) tools; $1500 (£300) presses, etc. of printer, or where judgment is for wages for services to defendant $400 (£80), many other articles.
Wyoming	Homestead to head of family of value of $1500 (£300).	$150 (£30) wearing apparel; to head of family:—$500 (£100) furniture; and other articles; $300 (£60) tools, etc.; $300 (£60) library, instruments, etc.
Territories.		
Arizona	Homestead to head of family of value of $4000 (£800).	Personal property to family of value of $1000 (£200) and other articles.
District of Columbia	No real estate exemption.	Clothing, furniture, etc. to value of $300 (£60); merchants' stock or mechanics' stock or mechanics' tools $200 (£40); family library $400 (£80); and other articles.
New Mexico	Homestead to head of family of value of $1000 (£200).	Wearing apparel, cattle, etc., books, etc., $200 (£40) furniture, and many other articles; to unmarried woman:—$150 (£30) wearing apparel and other articles; instruments, etc., $150 (£30); library of attorney, $500 (£100); many other articles; to head of family not an owner of homestead $500 (£100) real and personal property additional.
Oklahoma	Homestead to head of family of 160 acres and improvements; or 1 acre in city or town; or real or personal property of value of $600 (£120).	Wearing apparel, furniture, and many other articles.
Utah	Homestead to head of family of value of $1000 (£200), $500 (£100) additional for wife, and $250 (£50) additional for each member of family.	$200 (£40) chairs, etc.; $300 (£60) furniture, etc.; $300 (£60) farming utensils; $500 (£100) tools, etc.; instruments, etc.; $500 (£100) cabin of miner and $200 (£40), tools, etc.; many other articles.

J. W. J.

HOMOLOGATION (Fr.). Term employed for the formality by which an authority confirms certain acts or conventions between individuals or associations. It is most frequently used in relation to railway tariffs, general or special, which cannot be applied without the homologation in France of the minister of public works. The necessity for it was at first contested by the companies, which argued their absolute right to raise or reduce their rates within the limits fixed by their charters or acts of concession. The government maintained its prerogative of examining the proposed tariffs and imposing its veto by a refusal to homologate, as a measure of public policy, otherwise the established economic system of the country might be frustrated by differential rates in favour of foreign imports, particular merchandise, traders, or localities. The contention of the government prevailed, and all modifications of tariffs are now submitted to the department of public works for homologation. T. L.

HONOUR (liberty or franchise), a collection of manors, retaining their separate manorial organisation in most respects, even when one central court was held for all. These estates were developments of grants, made by Anglo-Saxon kings, of jurisdiction, with or without land, over large districts, even whole hundreds. None but lords of honours held courts over a district larger than a manor, and even such courts were really aggregations of manor-courts. As local jurisdiction and feudal organisation decayed the great lords might have succeeded in dividing the country among a few large landed proprietors but for the legal checks put upon their jurisdiction (Assize of Clarendon, 9, 11, Stat. of Marlborough), and upon the formation of new manors (Quia Emptores, 1290). Doubtless the caution of the kings helped to keep up the numbers, as well as to keep down the power, of the landed nobility and gentry.

[Stubbs, *Const. Hist.*, 1880, I. 106, 400.—Gneist, *Hist of Eng. Const.*, trans. 1886, p. 148, and ch. xi.—*Magna Carta*, 43.—Digby, *Real Property*, 1876, 52.] E. G. P.

HONOUR (Payment for). Where a bill of exchange has been noted or protested for non-payment, any person may intervene and pay it *supra* protest for the honour of any party liable thereon, or for the honour of the person for whose account the bill is drawn. Payment for honour is known in continental countries as payment by "intervention," a term which expresses its nature as a "negotiorum gestio." It thus constitutes an exception to the general rule of English law that payment by a stranger to the contract is ineffectual to liberate the debtor. Where a bill is paid *supra* protest the person who pays it is thereby subrogated to the rights and duties of the holder as regards the party for whose honour he pays, and all parties liable to that party.

[See § 68 of the Bills of Exchange Act, 1882; and Chalmers, *Bills of Exchange*, ed. 4, p. 230.] M. D. C.

HOOKE, Andrew (18th century), compared the capital wealth of the country with the amount of the national debt in order to show that the existence of the latter involved no danger to the state. He estimated the growth of capital between 1600 and 1750 by assuming the value of the personal stock to be twenty times as large as the amount of coin in circulation; to this he added the value of lands and houses; and thus arrived at a total of a thousand million pounds, or twelve and a half times the amount of the national debt in 1750. Such estimates must always be based on conjecture rather than on knowledge; and that made by Hooke was distinctly too high. Hooke also suggested a scheme for the discharge of the national debt.

An Essay on the National Debt and National Capital, or the Account truly stated, Debtor and Creditor, London, 1750.

[M. V. D. M. [Monsieur Vivant de Mézagues], *A General View of England from the Year 1600 to 1762 in a Letter to A. M. L. C. D.* Translated from the French, London, 1766.—Sir R. Giffen, in *The Growth of Capital*, London, 1889, p. 90, speaks highly of this publication, which supplies the means for a criticism of that of A. Hooke.] R. H. H.

HORN, Ignace Einhorn, also known as Edward Horn (1825-1875), was born at Vag-Ujhély (Hungary) and died at Pesth. Having taken a part in the insurrection of 1849, he was compelled to leave his country and went to Germany, where he published *Hungary before 1848* (in German) in 1851. The publication of this work brought on him a political prosecution. The severe sentence which followed compelled him to take refuge in Belgium, where he published, also in German, his *Statistisches Gemälde des Konigreichs Belgien*, 1853, and *Bevölkerungswissenshaftliche Studien aus Belgien*, 1854. In 1855 he established himself at Paris, where he was soon employed as a contributor on the *Journal des Économistes* and on the *Revue Contemporaine* as well as on the *Journal des Debats* and *La Presse*, and also published *Das Kreditwesen in Frankreich*, 1857, *John Law ein finanzgeschichtliche Versuch*, 1858, then *La crise cotonnière et les textiles indigènes* (8vo, 1863) as well as the speech made on his reception into the Institute of Egypt at Alexandria, *Du progrès économique en Égypte*, 1864. In 1866 he published *La Liberté des Banques*. In this work Horn argued against monopoly in banking matters. Horn's essay on Boisguillebert, for which he obtained a prize from the Institute, was published the next year under the title of *L'économie politique avant les physiocrates*, 8vo (these four in French). He also undertook a publication of the greatest value, the *Annuaire international du crédit public*. This was established by Horn with the assistance of other well-known writers in France and elsewhere, but

unfortunately it was only continued for the three years 1859, 1860, and 1861.

Horn took an important part during the year 1868 in the economic discussions going on in the public meetings permitted at that time. After this, Horn, who had been naturalised in France, unexpectedly returned to his native country, in which he was appointed to a post of much distinction. It should be added that he was greatly liked by all who knew him; that all his public occupations never made him a rich man; and that in the different countries where he took up his temporary abode he was much esteemed. This was particularly the case in France. A. C. f.

HORNE, ANDREW (d. 1328), an eminent lawyer, legal writer, and chamberlain of London, left two valuable compilations on law and procedure.

Liber Horne (preserved in the Guildhall of London).—*La Somme appelle Mirroir des Justices vel Speculum Justiciariorum*, to which Horne made many important additions, first pub. London, 1642.

[Sir E. Coke, *Prefaces to 9th and 10th Reports*, trans. by G. Wilson, London, 1777.—G. Crabb, *A History of English Law*, London, 1829.] R. H. H.

HORNECK (also written HORNICK and HŒRNINGK), PHILIPP WILHELM VON (about 1638-1713), a German economist, was born at Mainz. He came at an early age to Vienna with his father, who had been a physician in the Rhineland, and who, having become a convert to Catholicism, was ennobled and made an Austrian imperial councillor. The younger Horneck, about 1690, became private secretary of the prince bishop of Passau, who made him a privy councillor in 1695. His wife was a daughter of J. J. BECHER, and he seems to have derived some of his opinions from that economist, whose writings he often quotes. The work by which he is principally known is entitled *Oesterreich über alles, wann es nur will* (1684). It is an attempt to show how by a judicious economic policy the dominions of the House of Hapsburg, whose fortunes were then at a low ebb, might be raised to a higher and more independent position than any other European state. The author seeks to induce his fellow-countrymen to follow the economic methods of France, Holland, and England. The work is based on mercantilist principles; but, along with much that was erroneous or questionable, it contained many important suggestions for the development of the resources of the empire. It enjoyed a great popularity with the author's contemporaries and several succeeding generations, passed through many editions, and had considerable influence on Austrian policy in the 18th century; Joseph II., in particular, is said to have attached great weight to it.

[Roscher, *Gesch. der N. O.*, p. 289.] J. K. I.

HORNER, FRANCIS (1778-1817), born at Edinburgh, and educated at the university there, was called to the Scotch bar in 1800, but, dissatisfied with the law of his native country, removed to London in 1803, and was called to the English bar in 1807. He was appointed, in 1806, a member of the board of commissioners entrusted with the examination of the claims of the creditors of the Nabob of Arcot, but resigned this post in 1809. He entered parliament in 1806, remaining a member, except for one short period, until his early death, at Pisa. As a young man, Horner was remarkably studious, and, after entering parliament, very rapidly came to the front, so that at the time of his death he was one of the foremost of the Whigs, with a constantly-increasing reputation for oratory, sound knowledge, and remarkable integrity, combined with independence. In 1810 he was elected chairman of the Bullion Committee (see BULLION COMMITTEE, REPORT OF). The first part of this is from his pen: it is a concise exposition of the fallacy then generally held by the directors of the Bank of England and others, that the rise in the price of gold was caused by the foreign demand for that metal. Horner rightly attributed it to the over-issue of paper money. Though the resolutions moved by Horner in the House of Commons, in 1811, in favour of the resumption of cash payments, were defeated, and though the bullionists met with no better success in 1816, yet the effects of the Report, and of the controversy which ensued on its publication, were such, that the act for the resumption of specie payments was passed in 1819, following the lines of the recommendations of the committee. As regards other economic questions, Horner opposed the graduated duties on corn, urged the reduction of the peace establishment in 1816, and spoke against the Alien Bills.

Though originating no new theory in political economy, Horner possessed a very complete knowledge of the science—D. Stewart considered him his model pupil—and his critical acumen is well illustrated by his strictures on Adam Smith's deductions concerning the bounty on exported corn (*Edin. Review*, No. ix. pp. 190, etc.), and more particularly on Smith's theory of prices (*Letters, passim*): there exists also a letter from him to Malthus, attacking the latter's reasoning on the corn question. Apart from the *Report of the Bullion Committee* and *A Short Account of a late Short Administration* (Pitt's), his only writings are essays in the *Edinburgh Review*, of which he was one of the founders. These articles are all noticeable for his thorough knowledge of his subject, this being a characteristic trait in all that he undertook. The most important of these reviews are:—

Thornton's *Inquiry into the Nature and Effects of the Paper Credit of Great Britain* (Oct. 1802).—Canard's *Principes d'Économie politique* (Jan. 1803).—Lord King's *Thoughts on the Restriction of Payments in Specie at the Banks of England and Ireland* (July, 1803).—Miss Williams's *Political and Confidential Correspondence of Louis*

XVI. (Oct. 1803).—*Cursory Observations on the Act for Ascertaining the Bounties, and for Regulating the Exportation and Importation of Corn*, by an M.P. (Oct. 1804).—Stewart's *Short Statement of Facts Relative to the Late Election of a Mathematical Professor in the University of Edinburgh* (Oct. 1805).—*Earl of Selkirk's Observations on the Present State of the Highlands* (Oct. 1805).

[*Memoirs and Correspondence of Francis Horner, M.P.*, edited by L. Horner (1843).—*Edinburgh Review*, clviii. (1843), pp. 261-99.—Lord Cockburn, *Life of Lord Jeffrey* (Edin., 1852).—Lord Brougham, *Statesmen of the Times of George III.*, 2nd series (London, 1839).] R. H. H.

HORSLEY, W. (1701 ?-1776 ?), published, in 1744, a translation of a French *Treatise on Maritime Affairs*, and an adaptation of Frederick the Great's Anti-Machiavel entitled *Lord Theodore's Political Principles*. In 1746 appeared *The Political History of Europe*, containing a collection of public treaties and a curiously crude historical summary. Horsley is credited, in the British Museum and other catalogues with the *Universal Merchant*, London, 1753,[1] of which the real author was Nicolas MAGENS, written Meggens by Adam Smith in his "Digression Concerning the Variations of Silver," bk. i. *Wealth of Nations*.

Horsley is stated to have translated the work from the German; he contributed a dedication to Pelham.[2]

[Magens himself in *Further Explanations of some particular subjects contained in the Universal Merchant*, London, 1756, says, "I will add . . . to those, which I ventured to assert in a book upon this and other subjects, published by Mr. Horsley under the too pompous title of the *Universal Merchant*." The authority for the statement that the book was a translation from the German and the translator Horsley is Sir James Steuart, *Inquiry into the Principles of Political Economy*, vol. ii. p. 158, London, 1767, 4to. Otherwise there would be much to suggest that the book was written in English. For Horsley's connection with Magens, see, further, *Quarterly Journal of Economics*, vol. v. p. 356, *Annual Register*, xix. p. 123.] H. E. E.

[1] The title is as follows:—*The Universal Merchant*, containing, etc., London. Printed by C. Say, for W. Owen, at Homer's Head, near Temple Bar. MDCCLIII.

[2] To the Right Honourable Henry Pelham, Esq., etc. This Book, calculated for General Use, is with the Greatest Respect, etc., inscribed by William Horsley.

Sir—I have the Greater Pleasure in presenting this Work to your Consideration, as it is the Performance of a Foreigner resident among us who participates with us the Sweets of Liberty, and who gratefully makes us the best Returns in his Power, for the Benefit he receives from the due Execution of equal Laws. . . .

His views, in the reasoning Part, are to establish an universal social maxim. . . .

The Author, after reasoning the Reader into right Notions of Trade, where he falls into many of Mr. Wood's Sentiments, enters into an Enquiry. . . .

His manner of pursuing those Subjects is different from anything I have seen. . . .

—— the Performance in a particular manner claims your patronage, as the Author, though an *Alien* by birth, is a Englishman by Interest. . . .

HOSPITALS. See CHARITY.

HORTON, SAMUEL DANA (1844-1895), a leading American writer upon bimetallism, was born in Pomeroy, Ohio, and died in Washington. He graduated at Harvard University, in arts in 1864, and in law in 1868. After some foreign travel he began the practice of his profession in the Ohio courts, but was diverted from this after a few years to the study of monetary science, by the protracted discussions which preceded the resumption of specie payments by the federal government. As the son of Valentine B. Horton, who as a member of congress in the early part of the civil war secured wide reputation, but also the displeasure of his constituents, by a courageous opposition to paper money inflation, Dana Horton had an inherited interest in questions of currency. From the publication of *Silver and Gold* in 1876 until the end of his life the study of these were his absorbing pursuit. He was a commissioner for the United States in the International Monetary Conferences of 1878 and 1881, and became widely known in Europe and America as an advocate on scientific grounds of international bimetallism. The independent action of the United States in 1878 and 1890 he condemned. "We should offer Europe to take silver as money without stint when she does, but not take a dollar until she does so." Among the impatient or interested advocates of unrestricted silver coinage therefore he did not retain the authority to which his ability and learning entitled him. His researches in the history of the single and double standards of England and France respectively were fruitful and important. He was a frequent speaker and writer of great vigour, originality, and variety of resource, in a style sometimes striking, but often too involved and abstruse to be thoroughly effective.

Omitting many pamphlets, articles, and addresses, the following are the chief of Mr. Horton's publications, valuable for their research and the number of important original documents which they contain—

Silver and Gold, and their relation to the Problem of Resumption (1876, revised in 1877).—*Historical Material for the Study of Monetary Policy*, and *Contributions to the Study of Monetary Policy*, both prepared for the International Conference of 1878, printed with the proceedings of the Conference by the United States government 1879, and including a bibliography of money, and documents to illustrate the monetary history of France, England, and the United States—some here printed for the first time,—*Sir Isaac Newton and England's Prohibitive Tariff upon Silver Money*, being an open letter to Professor Jevons (1881).—*The British Standard of Value*, being an address before section F of the British Association (1885), with an appendix containing hitherto unnoticed reports by Locke and Newton.—*Silver before Congress in 1886*, in the *Quarterly Journal of Economics* (October 1886).—*The Silver Pound*

and England's Monetary Policy since the Restoration, together with the History of the Guinea, (1887). *Silver in Europe* (1890, revised in 1892). —*The Suspended Rupee and the Policy of Contraction* in the *Economic Journal* (September 1893). [See Obituary by Pres. E. A. Walker in *Economic Journal*, June 1895.] C. F. D.

HOTCHPOT. It frequently occurs in wills and settlements that power is given to a person to appoint a fund in such shares as he or she shall think fit among the members of a class, *e.g.* the children of a marriage; in such cases there is generally a direction that if the appointments made by the person to whom the power is given do not exhaust the fund, the unappointed part is to be divided in equal shares among all the members of the class. If nothing further were added injustice might easily result, and for that purpose a clause called the hotchpot clause is generally inserted, providing that no member of the class shall take a share of the unappointed part, without bringing the appointed share into "hotchpot," which means that for the purposes of the division the appointed share must be thrown back into the common fund. E. S.

HOUGHTON, JOHN, an apothecary and dealer in tea, coffee, and chocolate, was a fellow of the Royal Society and a friend of Halley and other distinguished men of the day. From 1692-1703 he edited a weekly paper called *A Collection for Improvement of Husbandry and Trade*, containing articles on "some matter of public interest in art or science or trade, a price list of corn and some other commodities, from many English market towns, and a number of advertisements" (Rogers, see below). From 17th August 1694 to 17th September 1703 he also kept a weekly register of the price of Bank of England stock, and often of other stock, especially of the East India, the Hudson's Bay, and the African companies; as well as of the "rate of exchange, especially with Amsterdam." He also drew up *An Account of the Acres and Houses, with the Proportional Tax . . . of each County in England and Wales*, 1693.

[Thorold Rogers, *The First Nine Years of the Bank of England*, Preface. The weekly prices of bank stock are prefixed to this book.—Andrew's *Hist. of Brit. Journalism.—Dict. of National Biography.*] E. G. P.

HOURS OF LABOUR. In strictness, economics are not concerned with the amount of the day which should be given to work. The capacity of the individual for valuable work varies enormously. By stress of facts a political question has arisen in most civilised countries as to the number of hours which the manual labourer should be required to give to his employer each day. The scope of the practical question has thus, whether rightly or not, been distinctly limited.

There are three points of view from which the question may be regarded—(1) that of the dependence of the labourer on his employer; (2) that of the improvement of the individual life and happiness; (3) that of the effects on the value of the labour given.

The first two have in turns been uppermost in the minds of those who have advocated the shortening of the hours of labour. The last point of view is one which has only recently attracted real attention in connection with the eight hours movement, though the earlier economists had some notion of it (*vide* J. S. Mill, bk. i.). Yet the most practical method of treating the question of the hours of labour is to establish, if possible, the fact that the work is so much better done on the shorter hours as to make up for the loss of mere time. Professor Thorold Rogers appears to have been the first to suggest this as a practical argument when he held that the excellence of the old masonry and other enduring work of the middle ages was only compatible with the prevalence of short hours. It has recently been asserted by Australian employers that the quality of work has vastly improved with the eight hours day. The most detailed attempt to prove the position is perhaps that of Mr. Rae (*Contemporary Review*, October 1891). It is clear that if the case be made out, the adoption of shorter hours will quickly follow; and it is obvious that greater leisure ought to be better for the individual workman, and that with a rising standard of life he must become more independent without being less useful.

In Great Britain the attempt to legislate on this subject seems to have been much earlier than on the continent. Putting aside Professor Rogers's theory just noted, and Sir Thomas MORE's proposed 6 hours for the Utopia, we have an act of Elizabeth prescribing a day of 12 hours with 2½ hours' rest, and we know that at the beginning of this century the usual working day was from 11 to 14 hours, and often longer, in the factories. The early factory acts were directed to the relief of young children and women. That of 1802 was the first, limiting the hours for children to 12 a day; that of 1819 placed the hours for children between the ages of nine and sixteen at 72 per week; and that of 1825 gave them a Saturday half-holiday. Sir John Hobhouse's act of 1831 reduced the hours for persons under eighteen to 69 per week. The reports of the factory commission (1832-33) took a wider view of the subject. They show that while the working day in many cases at that date ran to 13 hours, it often did not exceed 10 or 11, and was usually 12 to 12½. In Birmingham and Coventry, where the operatives worked, as they now do, chiefly at their own homes, and were independent, the day was usually less than 10 hours, often less than 9. It was about this time that Richard OASTLER and Lord Shaftesbury commenced to advocate a legal maximum of 48 hours per week, which

was adopted for children in the regulations for children under thirteen in the act of 1836. The Mines Regulation Act of 1842 was the next step in advance, and after the failure of a ten-hours bill for females in 1844, and of a similar bill for all persons in 1847, the legal day was made 10 hours in 1850. Apart from a certain agitation for further reduction, no advance was made on this till the Factory Act of 1874, which placed the limit at 56½ hours per week. The recent royal commission find that they have now a tendency to approximate to 54 a week. Recent efforts are dealt with in a separate article (EIGHT-HOURS MOVEMENT), but we may mention the Hours of Labour Bill in the session of 1891, and the Shop Hours Acts of 1892, under which no person under eighteen can be employed for more than 75 hours a week in shops.

In the British possessions there is little trace of a history similar to that of the FACTORY ACTS, but as a rule hours of labour are shorter than at home, and Australia is in advance of the whole world in this respect, as the eight hours system has there become thoroughly established since it was first adopted by the stonemasons of Victoria in 1856 (*vide* art. cit.). In Canada 10 hours is usual, but 9 hours not uncommon. At the Cape 9 hours is the usual length of the working day. In the tropics the style of labour is so different that the mention of any number of hours is hardly a fair criterion. The blue book of the recent royal commission on labour returns them at from 6 to 11 a day in the West Indies, and from 11 to 14 in India.

In most foreign countries there has been a slow growth of agitation in favour of a shorter working day, mostly following in the wake of English experience. Germany has had a special movement arising directly from the efforts of Karl MARX and his school. The United States have had the question settled almost without being raised, owing to the greater independence of labour and the greater profusion of apparent wealth amongst all classes.

In the same district we find different trades working different hours, even in our own country. There seems to be no regular principle determining this. Particular trades have obtained shorter hours by some special agitation often arising out of special events. Where, however, a direct service is rendered to the general public, as in tramcars and restaurants, hours tend to run to greater length.

And different reasons have conspired to bring about the shortening of hours in our own country and the colonies—*e.g.* in Australia climate was alleged as a factor.

HOUSES, TAXES ON. See TAXATION.

HOWARD, JOHN (1727-1790), was the originator of the modern method of dealing with criminals. His career as a reformer dates from his appointment as high sheriff of Bedfordshire in 1773, when, struck with the abuses in the management of gaols, he was led to visit the prisons throughout the kingdom, and afterwards travelled several times over the whole of Europe, devoting his life to the inspection of prisons and hospitals. In his zeal to learn the true facts or to bring relief to prisoners, he never shrank from exposing himself to the infection of gaols, hospitals, and lazarettos; and ultimately died at Kherson of a fever which was raging there. The facts collected during these journeys were laid by him before the government, and many humane reforms were introduced on his suggestion, the most immediate of which were the two acts of parliament passed in 1774, for the relief of acquitted prisoners in the matter of fees, and for preserving the health of prisoners. He was also successful in introducing reforms in many foreign countries. Among those who most fully recognised his merits was Burke, whose eulogy of Howard, in his speech at Bristol in 1780, is well known. Howard's works include observations on the condition, both administrative and structural, of prisons, hospitals, lazarettos, etc., throughout Europe, together with proposed reforms. In preparing these for the press, he was greatly aided by his friend, Richard PRICE. Howard also paid much attention to the condition of the tenants on his estate at Cardington in Bedfordshire, providing sanitary cottages and schools.

R. H. H.

HOWE, JOHN BADLAM (1813-1882), born in Boston, Mass., died in Indiana.

He was the author of several works on money, as follows: *Monetary and Industrial Fallacies*, Boston, 1878, pp. 248.—*Political Economy of Great Britain, United States, and France, in the use of Money.—A New Science of Production and Exchange*, Boston, 1878, pp. 592.—*Monometallism and Bimetallism*, Boston, 1879.—*The Common Sense, the Mathematics, and the Metaphysics of Money*, Boston, 1881, pp. 329. The last of these is a summary of the others. D. R. D.

HOWLETT, JOHN (1731-1800), clerk in holy orders and statistician. Howlett's works merit attention on account of his independence of thought and careful investigation of fact. His researches brought him into considerable opposition to Dr. PRICE (*q.v.*) who—writing in 1779—concluded that the population of England and Wales must have decreased since the Revolution near a quarter, while Howlett showed that it must have increased. With reference to enclosures, at that time of great consequence, Howlett consistently maintained that they were rendered necessary by the increase in population, and resulted in agricultural improvement.

The nature of Howlett's interests can be gathered from the titles of his works:

An Examination of Dr. Price's Essay on the Population of England and Wales, 1781.—*An Inquiry into the influence which Enclosures have had upon the Population of England*, 1786.—*An Essay on the Population of Ireland*, 1786.—*Enclosures a cause of improved Agriculture*, 1787.—*The insufficiency of the causes to which the increase of our Poor and the Poor's Rates have been generally ascribed*, 1788.—At the end of Wood's *Account of the Shrewsbury House of Industry*, is a correspondence with Howlett, 1795.—*An Examination of Mr. Pitt's Speech in the House of Commons on 12th February 1796, relative to the condition of the Poor*, 1796.—*Dispersion of the present gloomy apprehensions of late repeatedly suggested by the decline of our Corn Trade*, 1798.—*The Monthly Reviewers reviewed*, 1798.—*An Inquiry concerning the influence of Tithes upon Agriculture.*

[See references in Dugald Stewart, *Lectures on Political Economy*. An article in the *Dictionary of National Biography* by the present writer gives more details with regard to Howlett's private life, etc.] E. C. K. G.

HÜBNER, OTTO (1818-1877), first a merchant, subsequently manager of one of the departments of the Austrian Lloyd Steam Boats Company, made himself prominent as one of the leaders of the German free-trading party. Exiled from Austria after the revolutionary events of 1848, he spent the remainder of his life in Berlin, and supervised, from 1852, the publication of his *Jahrbuch für Volkswirthschaft und Statistik* (Year-book of Public Economy and Statistics), and from 1869 the *Zolltarife aller Länder* (Customs Tariffs of all Countries).

In his book on *Banken* (1854) he maintained that paper currency ought always to be covered by an equal amount in cash. In 1864 he started with success a joint-stock insurance company destined to protect lenders on mortgage against the risks incurred in case of public sales of real estate given in guarantee of loans.

He also wrote a book on the *Finanzlage der Oesterreichischen Monarchie und ihre Hülfsquellen* (Financial Condition and Resources of the Austrian Monarchy) (1849). [See *Allg. Deutsche Biographie.*] E. Ca.

HUC, E., ABBÉ (1813-1860). After having resided in and travelled through China, Tartary, and Thibet during the years 1839-1846, this well-known French missionary published in 1850 his *Souvenirs d'un Voyage dans la Tartarie, au Thibet, et en Chine* (2 vols., 1850) with a sequel *L'Empire Chinois* (2 vols., 1857); the latter contains numerous notices and observations on trade, administration, navigation, etc. The fourth chapter of vol. ii. deals almost exclusively with these subjects, and gives some extracts from Chinese writers on the same topics. The same volume (pp. 72-83) presents us with a lively sketch of Wang-nan-Che, a Chinese socialist and harbinger of Mr. Henry George's views on the nationalisation of land, who lived in the 11th century after Christ.

The *Empire Chinois* obtained a prize from the French Academy, and has been translated into English; the Abbé Huc certainly does not belong to the class of "stupid" missionaries who excited the contempt of Adam Smith. E. Ca.

HUDSON'S BAY COMPANY. After the voyage of adventure and discovery of Captain Newland in 1669, a charter was granted (May 2, 1670) to the adventurers who had taken part in sending out that expedition, constituting them a company with exclusive trading rights in Hudson's Bay and the surrounding district, by the title of *The Governor and Company of Adventurers of England trading into Hudson's Bay*. Though after the revolution the power of exclusive trading based on royal charter came to an end in this and in other instances, the charter of the Hudson's Bay Company was confirmed by act of parliament for seven years; and the capital possessed by the company, with, in addition, the settlements and forts already founded practically secured it against competition. The company had, however, to endure the direct hostility of the French, who pressed into the territory traversed and worked by the company from Canada. By 1682 the company had five settlements, respectively at Albany River, Hay's Island, Rupert's River, New Severn, and Port Nelson, but with the exception of the last-named, these were all taken by the French in 1686. During the subsequent French war success fluctuated, inclining, however, to the side of the French. By the peace of Utrecht (1713) the forts were re-

stored to the company and reparation promised. This promise does not appear to have been satisfactorily fulfilled.

During the middle of the 18th century the company sustained a severe assault on its powers and privileges, as it was alleged that despite these it had done little or nothing to open up the territories under its control. Its trade was not great. A parliamentary inquiry instituted in 1749 reported at length but no action followed upon it. Over some of the lands the company had acquired definite legal rights, while throughout the whole country it claimed certain privileges.

In 1811 its rights came once more under dispute, and a considerable struggle took place between it and its chief competitor, which ultimately resulted in a coalition against all others.

The company still remains and carries on trade, though the purchase of its territory (1868) by the Dominion of Canada deprived it of any remaining claim to any powers beyond those of an ordinary trading company.

[Macpherson, *Annals of Commerce.*—Cunningham, *Growth of Engl. Industry and Commerce*, vol. ii.—Adam Smith, *Wealth of Nations*, bk. v. ch. i., as to the Trade of the Company.]

E. C. K. G.

HUET, François (1816-1865), the author of *Le règne social du Christianisme* (1853), a liberal Roman Catholic, the representative of what he terms ideal Catholicism, and a social idealist whose theories do not vary much from those of modern "social catholics" in France and Belgium (see Christianity and Economics). M. de Laveleye's high opinion of this writer's views was fully expressed on p. 137 of the 2nd edition of his *Socialisme Contemporain*. It is to F. Huet and J. S. Mill that De Laveleye dedicated his work on primitive property. Huet is equally opposed to individualism, as being founded on materialism, and to communism as the child of pantheism. He advocates liberal socialism as lying midway between the two extremes, and as resting on a theistic foundation or spiritualistic philosophy. Hence in the second book of his work he treats of "la Société spirituelle," in which the religious interest stands highest, whilst the third book is devoted to "la Société matérielle." In the latter he draws a distinction between "les biens patrimoniaux" and "biens acquis." The latter only was the result of individual labour, and as such can be claimed as private property. The former belong to society as a whole, such as land, etc., the gifts of the earth to which all have an equal right. These should return to the community, as public property, on the death of the present occupier. The first article of Huet's right of inheritance is as follows: Every year a division takes place of the *biens patrimoniaux* released by death. All young people of both sexes aged from fourteen to twenty-five have a share in it, the latter receiving twice the amount of the former. From this it will be seen that the standpoint of the author is that of an advanced Christian Socialist, whose endeavour it is to prove the identity of Christian liberty and the socialistic idea.

[F. Huet, *Le règne social du Christianisme;* cp. an article by G. Kriegmann in *Preussische Jahrbücher*, January 1887.]

M. K.

HUET, Pierre Daniel (1630-1721), member of the French academy, and tutor under Bossuet of the son of Louis XIV., directed the publication of the editions *ad usum Delphini* of classical authors, and enjoyed in his time a great celebrity for his erudition, which was rather wide than deep. He wrote several books of religious and philosophical controversy, autobiographical memoirs (in Latin, but since translated into French by M. Nisard), and a *Dissertation on Navigation under Solomon* (1698). Appointed bishop of Soissons in 1685, he had not yet taken possession of his see when he was transferred in 1689 to the bishoprick of Avranches. Shortly afterwards he retired to the abbey of Fontenay near Caen, to devote himself entirely to his learned researches. People wondered why the king had appointed a bishop who had not yet reached the end of his studies.

His *Histoire du Commerce et de la Navigation des Anciens* (1 vol., issued anonymously in 1716, and republished in Lyons in 1763, with the author's name) had been written at the request of Colbert, a long time before it appeared. Commencing at the creation, and including the Persians, Chinese, etc., this book is certainly a rather shallow production, but to be fair, we ought to remember what Huet himself stated in his dedication to Colbert: "Only such an authority as yours could draw me away from the studies which have always engrossed my attention, to direct it towards another so different. . . . No forerunner has opened the road for me, I had no guide to lead me, and no support on which I could lean" (See "Huet," in *Collected Essays*, by Rev. Mark Pattison, Oxford, 1889).

E. Ca.

HUFELAND, Gottlieb (1761-1817), a distinguished German economist, was born at Dantzic, studied at Leipzig, Göttingen, and Jena, and became in 1788 extraordinary, and in 1793 ordinary, professor in the university of the last-mentioned place. He passed in 1803 to the high school of Würzburg, and in 1806 to that of Landshut. From 1808 to 1812 he was bürgermeister of his native city, then republican; in the latter year he returned to Landshut, where he resumed his academic occupations, and in 1816 removed to Halle, where in 1817 he died. His principal economic publication—for he also wrote on jurisprudence—was *Neue Grundlegung der Staatswirthschaftskunst durch Prüfung und Berichtigung ihrer Hauptbegriffe*, vol. i., 1807; vol. ii., 1813.

The second volume appeared in a new edition, 1819, with the title *Die Lehre vom Gelde und Geldumlaufe*. His principles were essentially those of Adam Smith, of whom he speaks with warm admiration in the preface to his work; and he did much to extend the knowledge and acceptance of the English economist's doctrine in Germany.

[Roscher, *Gesch. der N.O.*, p. 654.] J. K. I.

HÜLLMANN, KARL DIETRICH (1765-1846). Appointed professor of history in 1797 at the university of Frankfurt on the Oder, and in 1808 of history and statistics at Königsberg, Hüllmann was sent in 1817 to Bonn, where he was the first rector of the then recently-inaugurated university; for years he acted as the confidential representative of the Prussian government. His literary activity was considerable, as appears from the long list of his historical works.

As an historian, Hüllmann had a decided conservative bias, modified however by the liberal tendencies of the times in which he lived. This appears very clearly from the address to the Germans (*Zuschrift an die Deutschen*), which serves as a preface to the second edition (1830) of his *Geschichte des Ursprungs der Stände in Deutschland* (Origin of the (political) Classes and States in Germany). His best-known work is the *Städtewesen des Mittelalters* (Town Life and Administration in the Middle Ages), 4 vols. Bonn, 1826; "This is still," writes Prof. Ashley in his *Ec. History* (vol. i. pt. ii. p. 5), "the most complete attempt to cover the whole ground of mediæval civic life, and it illustrates the general similarity of conditions all over Western Europe." His other works are *Deutsche Finanzgeschichte des Mittelalters* (1805), giving the history of the mediæval finances of the German empire, not of the various German states, with a supplement on the origin of regal dues (*Ursprung der Regalien in Deutschland*, 1806); *Geschichte der Domänenbenutzung in Deutschland*, 1807 (History of the Management of the State Domains in Germany); *Gesch. des Byzantinischen Handels* (Hist. of Byzantine Commerce), 1808; *Handelsgeschichte der Griechen* (Hist. of Greek Commerce), 1839; he also wrote on the Political Systems of the Ancients (*Staatsrecht des Alterthums*, 1820); the Origin of the Mediæval Ecclesiastical System (*Ursprünge der Kirchenverfassung des Mittelalters*, 1831); the Roman and the Jewish constitutions, etc. E. Ca.

HUMANISM, ITS INFLUENCE ON ECONOMICS. By humanism we mean that tendency of the earlier and later Renaissance which makes the culture of humanity its chief aim, and which in its anthropocentric view of life affects in a marked degree the course of economic theory and practice. As a revolt against the mediæval views of life, being pagan in its origin, it attaches supreme importance to human happiness here below, and puts temporal above spiritual interests. Humanism, in short, as Mr. Symonds defines it, "is an ardent interest in men as men." Hence the beauty of the human form as in classical art, of human virtue according to classical models, and human rights and liberty as conceived of in the republics of antiquity, are its ideals. Accordingly Roscher notes five points of contact between the progress of humanism and that of political economy. (1) As the classical writers represent a high state of civilisation, they raised the general standard of culture and tended to accelerate efforts in the division of labour and the economy of wealth as means thereto; (2) As the higher life of the ancients was mostly developed in the town, so a study of the classics would help in giving force and direction to civic industry of the rising towns towards the close of the middle ages; (3) The patriotism breathing in the classics would stimulate the consciousness of national life and thus encourage the centralising tendencies of "national" economy; (4) The mixed elements of imperialism and democracy reflected in the classical writers would on the other hand foster monarchical absolutism as in the mercantile system, and also its democratic counterpart in the *laissez-faire* doctrine of political economy; (5) The cultivation of the critical spirit of the humanist, which, undermining as it did the foundation of authoritative religion, tended to disparage the spiritualistic ideals of life held up by Christianity in favour of material aims and materialistic pursuits in the place of heavenly felicity. It will be convenient to consider the influence of humanism under these five heads:

1. *Classical culture*, with the revival of learning, brought into prominence the economical doctrines of ARISTOTLE and PLATO, the theory both of state and household economy (*πολιτικὴ ἐπιστήμη* and *οἰκονομία*) from which political economy derives its modern appellation. Aristotle's doctrine of wealth (*χρηματιστική*) and Plato's ideas of the division of labour, and his view of the danger of private property, contain the germs of the science. In a lesser degree this is true of Cicero, Seneca, and Pliny the elder, the first of these, as translator of the *Economics* of Xenophon, being among the earliest economists who show a decided preference for agriculture over manufactures and trade (see Professor Cossa's *Introduzione allo Studio dell' Economia Politica*, 1892, pp. 149 *seq.*; *ib.* 160-161, English edition 1893; *ib.* 129-140). Not only philosophers and jurists in the 14th century, but humanists such as GERSON, who paid much attention to the theory of value, follow Aristotle (*ib.* 102-105), whilst in the 15th century, when the progress of industry and literary culture were at their height, we find Erasmus platonising in his warnings against overestimating the accumulations of wealth, yet at the same time with Aristotle recognising the importance of commerce, and of money as a means of exchange. Another typical humanist, Ulrich von Hutten, inveighs against luxuries

and monopolies, whilst CAMERARIUS, one of the younger humanists, combated mediæval objections to payments of interest. MORE'S *Utopia*, like *The Christian Prince* by Erasmus, bears witness to the influence of classical modes of thought; the keynote in both is "that the object of nations and governments is the common weal of the whole people."

2. *Civic Industry.*—It was in Italian republics, in cities like Florence for example, that the spirit of the Renaissance found its fullest expression (see CITY, MEDIÆVAL); and here, too, the classical ideal of an urban or municipal republic was most closely approached. As the classical modes of industry were reproduced, so here, too, with heightened prosperity and luxurious refinement, we meet the same sharp contrast between rich and poor as of old. There are conflicts between the merchants and the craftsmen: and Savonarola, in one of his sermons, recommends the passing of a law for opening shops and providing work "for the populace now idling in the streets." In estimating the effect of humanistic studies on economic progress there is room for divergency of opinions. Thus, according to Mr. Symonds, "fresh value was given to the desires and aims, enjoyments and activities of man, considered as a noble member of the universal life" (*Revival of Learning*, pp. 46-47). On the other hand Mr. W. S. Lilly, *Nineteenth Century*, p. 5 (Jan. 1893), speaks thus disparagingly of the Renaissance: "It might with far greater truth be called a new birth into servitude. This it was assuredly, both in the political and *economic* order." It has been noticed, too, how in the Germanic towns the energising influence of revived and reformed Christianity, and its consecration of honoured labour, modified the enervating effects of the Renaissance and militated against the classical contempt of handicrafts. We might select as an illustrative instance of this the "city" of London with St. Paul's as the temple of the Renaissance, and the school close by founded by the humanist Dean Colet, with the Royal Exchange founded about the same time in the vicinity of Lombard Street, as bearing the various traces of a contemporary development of commerce, and culture, and religion, under the conjoint influence of the Reformation and Renaissance—an instance showing the truth of M. E. de Laveleye's dictum that "the countries which have embraced the Reformation are decidedly in advance of those which have stopped short at the Renaissance. . . The Renaissance was a return to antiquity, the Reformation a return to the gospel. The gospel being superior to the tradition of antiquity, was sure to yield better fruits" (*Protestantism and Catholicism in their bearing upon the liberty and prosperity of Nations*, p. 32).

3. *Patriotism.*—The pagan view of tribal morality, and its tendency to subordinate the interests of the individual to those of the community, and which as in the neo-paganism of our own time attempts to find in it a kind of substitute for religion, as an antidote against "de-ethicising" influences of scepticism, exercised an important influence on the development of economics in the humanistic era. For the growth of national sentiment stimulated national egoism, and on this is founded the MERCANTILE SYSTEM of political economy. In this respect the effects of the Renaissance were similar to those of the Reformation (see CHRISTIANITY AND ECONOMICS: "Influence of Protestant Thought").

4. *Imperialism and Democracy.*—The humanists, too, like the reformers, and, it might be added, like the rising towns, had a strong leaning towards royalty and regal protection in the struggle against the common enemy, the rude feudality and barbarian aristocracy of the day. Hence they encouraged royal absolutism. In economics this produced *Colbertism*, or the centralisation of trade and commerce and the establishment of royal monopolies. It also led to the creation of "state romances," or pictures of ideal commonwealths like Fénelon's *Voyage en Salente*, in which an important rôle is assigned to benevolent despotism in the economic management of the state. This is in strict correspondence with the classical conception that the head of the state like the head of the family has the *patria potestas*, hence the idea of patriarchal government as the representative of the state. Royalty, as Guizot puts it, was "la personnification de la souveraineté du droit," just as in imperial Rome the head of the state was "la personnification de l'État, l'héritière de la souveraineté et de la majesté du peuple romain" (*Histoire de la civilisation en Europe*, 6th edition, pp. 221 and 228). Thence were derived the earlier cameralistic and later bureaucratic methods of national economy culminating in the *Ancien Régime*, during which, "en pleine renaissance," to use the words of De Tocqueville, it was the fashion to consider "le droit de travailler comme un privilége que le roi peut vendre" (*Ancien Régime*, p. 154). The reaction against this was the individualism of the revolution, in which the opposite or democratic conception of individual rights finds its expression. "The whole movement of humanity from the Renaissance onward has tended in this direction, *i.e.* the Utopia of a modern world in which all men shall enjoy the same social, political, and intellectual advantages"—in short, "the organisation of society in harmony with democratic principles" (Symonds: *Renaissance in Italy*: I. *Age of the Despots*, p. 30). In the same way Rousseau's demand for a return to nature, where all are free and equal, has been traced to a revival of classical stoicism, and the passionate enthusiasm of French lawyers for "natural law," the *jus*

naturæ of Hobbes and Grotius, on which is founded the theory of the rights of men and the demand for natural liberty extended to commerce and economics. This was adopted by A. Smith from the physiocrats, whose chief dogma is to leave everything to nature and natural laws, and not to interfere with the play of natural forces; *i.e.* in the language of A. Smith, not to interfere with the obvious and simple system of natural liberty in the economic world. In this demand appeals are made constantly to the "ancients" by revolutionists in their cries for liberty and equality, as the article on political economy written for the *Encyclopædia* by Rousseau "rings with the names of ancient rulers and lawgivers" (see Morley's *Rousseau*, vol. i. 145 and 191 *seq.*), whilst one of the chief promoters of the doctrine of *laissez-faire*, the Marquis D'ARGENSON, looks to the ancient Greek republics as ideal communities where true liberty prevailed. But from this doctrine of "following nature" are derived other doctrines of "classical economy," such as the "natural increase of capital," and the "natural right of property," which produced in their turn great inequalities, and led on to the socialistic reaction in favour of collectivism and revolt against the power of "capitalism." The latter leans itself for support on the Roman law of private property, just as government direction of trade and commerce was an imitation of classical Cæsarism. Thus both the idea of individualism in the sense of personal liberty, and the collective individuality of the state, the leading doctrines of abstract and historical methods of political economy respectively, may be traced to the influence of classical conceptions revived by humanistic studies under the two-fold aspect of society as a collection of free citizens under the rule of popular sovereignty and a corporate personality with imperial power as the central organ of government, the two modern autonomies in politics and economics alike having for their object on the one hand the independence of man, and on the other the centralisation of society.

5. *Criticism.*— The critical spirit which humanistic studies and the contemporaneous progress in the natural sciences both in the 15th and 18th centuries called forth was antagonistic to the spiritualistic conceptions of Christianity. The epicureanism of the Novi Homines of the Renaissance and the naturalism of the Encyclopædists of the Revolution had for their aim either the culture of human nature, or the use of the newly-discovered forces of nature for the purpose of heightening the "splendid materiality" which captivated all minds then as now. In short, literature, art, and science were all to serve the purpose of terrestrial happiness. The effect of this on political economy as the science of wealth was stimulating. It directed all effort now set free towards the acquisition of material goods, as, also, it received a special impetus from the contemporaneous liberation of mind, and the growth of commercial enterprise owing to the revolution of prices in consequence of the discovery of America in the 15th, and the revolution of industry by steam and machinery in the 18th centuries. These combined in awakening both the spirit of curiosity and cupidity, the love of learning, and the lust of money as the result of the "outburst of new life, the carnival of liberty and energy." The development of the individual and the progress of society was the superstructure built, or attempted to be erected, on this material basis. Later on the philanthropic or humanitarian as distinguished from the purely humanistic elements of the earlier and later Renaissance are brought into prominence with the characteristic appearance of the "religion of humanity." A corresponding movement in political economy arises which seeks to incorporate it into the science of society, having for its paramount object the evolution of humanity. Henceforth the "economic man" is no longer considered merely in his relation to the community as in classical times, or as the "man as a machine" moved by self-interest and made what he is by the mechanism of natural laws, as in the natural revival of the last century; but he is now considered as a social unit in his relation to aggregate humanity, pursuing a higher ideal intellectually and morally, *i.e.* the highest development of man and society (see CARLYLE; CHRISTIAN SOCIALISM; A. COMTE).

HUMBOLDT, ALEXANDER VON, Baron (1769-1859). Besides his writings on natural sciences, the following works of this celebrated traveller, written in French and published in Paris, are entitled to be noticed from the economic standpoint: *Voyage aux régions équinoxiales du Nouveau Continent* (1807); *Essai politique sur la Nouvelle Espagne* (1811); and *Essai politique sur l'Ile de Cuba* (1826), as well as *l'Examen Critique de l'Histoire de la Géographie du Nouveau Continent et des Progrès de l'Astronomie Nautique aux XV^e^ et XVI^e^ Siècles* (1834). In 1848, the *Journal des Économistes* published a translation of his historical and statistical *Mémoire sur la Production de l'Or et de l'Argent considérée dans ses Fluctuations* (also printed separately, with a preface by M. Michel Chevalier) which had appeared several years before in a German quarterly review (*Ueber die Schwank-*

ungen der Goldproduktion in *Deutsche Vierteljahrschrift*, October 1838). It is interesting to notice that in this *mémoire* Humboldt predicts that new silver mines will one day be worked in northern America; he expects the future source of gold supply to be the Altai mountains in Central Asia. E. Ca.

HUMBOLDT, Wilhelm von (1767-1835), brother of Alexander von Humboldt, the traveller, was descended from a noble family in the Mark of Brandenburg. He was early associated with the celebrated Weimar circle, and much influenced by Goethe and Schiller. One of the foremost scholars of his age, renowned in literature, æsthetics, and the science of language, he fills a large space in the intellectual history of Germany. He ranks among economists by virtue of his work, written when he was still a young man, in 1792, *Ideen zu einem Versuch die Gränzen der Wirksamkeit des Staates zu bestimmen*, not published in full until after his death (by Dr. E. Cauer, Breslau, 1851), in which he pushes to the utmost extreme the limitations of the functions of the state. J. S. Mill in his book *On Liberty* highly commends this "excellent essay"; but, in fact, it so exaggerates the doctrine of objection to government interference as practically to refute it. The author restricts the action of the state to the preservation of external and internal security, and excludes from it all positive solicitude for the prosperity, nay, even the character and culture, of the nation. The immaturity of the ideas expressed in this essay is obvious. In his zeal for the supremacy of the individual, he proposes that marriage should be terminable at the will of either party, and without any allegation of reasons—a suggestion from which Mill thought it necessary to express his *partial* dissent. The most complete *ad hominem* answer to his doctrines is supplied by his own activity at a later date in the cause of educational reform in Prussia. In 1809, immediately after the retirement of Stein, and when Altenstein was minister, Humboldt returned from Rome, where he had been Prussian representative at the papal court, and was placed at the head of the section of public worship and instruction under Dohna, who had the general control of the department of the interior. In this capacity he devoted himself to the reform of education in the primary schools and high schools and crowned his work by the foundation of the university of Berlin, procuring for it a large public endowment. Afterwards we find him turning his attention to finance and public economy, a study in which he was encouraged by Stein, who recommended to him in particular the writings of Forbonnais and Ganilh. But his most conspicuous activity in later years was in the fields of politics and diplomacy, into which we cannot here follow him.

[Seeley's *Life and Times of Stein, passim.*—Dove in *Allg. Deutsche Biogr.*—Good account in R. Fester's *Rousseau und die deutsche Geschichtsphilosophie*, 1890, pp. 292-309.] J. K. I.

HUME, David (1711-76), philosopher, historian, and economist, was born at Edinburgh. He was "seized very early with a passion for literature." After fruitless efforts to apply himself to law and commerce, he paid, in 1734, a three years' visit to France, where he laid down his future plan of life. "To make a very rigid frugality supply my deficiency of fortune . . . and to regard every object as contemptible except the improvement of my talent in literature." In 1738 he published his *Treatise of Human Nature*, which contained, though in bald outline, the substance of the future philosophical writings; and in 1742 the first series of *Essays Moral and Political*, which was favourably received. After a twelve months' tutorship of Lord Annandale, he was appointed in 1746 secretary to General St. Clair, and in this capacity visited the courts of Vienna and Turin, wearing, according to Lord Charlemont, his uniform "like a grocer of the trained bands." *The Enquiry concerning the Human Understanding*, a recast of the first portion of the *Treatise*, was published in 1748. The years 1749 and 1750 were spent at his old home, Ninewells, in the composition of the *Political Discourses*; "The only work of mine that was successful on the first publication"; and in the recasting of another portion of the *Treatise* into the *Enquiry concerning the Principles of Morals*. "Of all my writings, in my own opinion . . . incomparably the best." In 1752, Hume became librarian to the Faculty of Advocates, and planned the *History of England*, successive portions of which appeared in 1754, 1756, 1759, and 1761. In 1753, he wrote the Essays *On Suicide* and *On the Immortality of the Soul*, which were printed, but promptly suppressed. *The Natural History of Religion* was finished in 1757, but was not published during Hume's life. In 1763 Hume accompanied Lord Hertford to Paris, where his stay was a continuous triumph. Among others who were brought to do him honour, were the future kings, Louis XVI. and Louis XVIII. Returning to England in 1766, he was appointed, in 1767, Under secretary of State, an office he held for a year. In 1769 he returned to Edinburgh, "very opulent." Six years later he was attacked by a mortal disease, and met death with the fortitude and cheerfulness of a philosopher. He appointed his friend Adam Smith his literary executor.

In Hume's own words, he was "a man of mild disposition, of command of temper, of an open, social, and cheerful humour . . . and of great moderation in all my passions." In justice, however, it must be added, that his letters display a less pleasing side of his character, and modify,

though they do not reverse, the above verdict. The intemperate extravagance with which everything English is continually condemned, the restless vanity that no praises can satisfy, show the other side to the shield.

It has been asked why the labours of Hume in philosophy came to so sudden an end? "His contributions to metaphysics were written by 1736, when he was five-and-twenty; his contribution to the philosophy of religion by 1750, when he was thirty-nine; and after this date, he added nothing." At least two answers may be given, each in itself perhaps sufficient. Hume dearly loved fame, and the *Essays* obtained what had been denied to the *Treatise*. Again, Hume had nothing in him of the martyr's temperament; he loved to stand well in the thoughts of the great and the respectable; for this purpose Tory politics were more profitable than heretical philosophy. Be this as it may, it is possible that Hume had already made his full contribution to metaphysics, while the gain to political philosophy has been great. *The History of England* need not detain us; if it is still read, it is merely on literary grounds. But the two sets of *Essays, Moral and Political*, the later of which was first published under the name of *Political Discourses*, are without doubt *κτήματα ἐς ἀεί*. The original essays, amidst much ephemeral matter, on *Standard of Taste*, etc. (wherein Bunyan and Addison are compared to a pond and the ocean), contain within them a system of political philosophy. The object of government is the distribution of justice; "in other words, the support of the twelve judges." There is a "perpetual intestine struggle" between authority and liberty, of which the former must be "acknowledged essential to the very existence of society," while the latter is "its perfection." Parliament, "while, from our very constitution, it must necessarily have as much power as it demands, and can only be confined by itself," is, in fact, restrained by the interest of the individuals composing it, differing from the interest of the body as a whole, inasmuch as they are individually amenable to the influence of the crown. Absolute monarchy is the "true Euthanasia of the British constitution," as being preferable to pure democracy.

In approaching Hume as economist, it must always be remembered that political economy grew out of political philosophy, and that Hume is still in the transition stage. Although he believes in the possibility of a science of economics, and describes its subject-matter, he does not use the term. The economic essays were published (1752) in a volume entitled *Political Discourses*, and the subjects discussed —commerce, refinement in the arts, money, interest, balance of trade, jealousy of trade, taxes, and public credit—are regarded largely from the statesman's standpoint. In his opposition to the views of the mercantilists, upon the BALANCE OF TRADE (*q.v.*), and the precious metals, he had been forestalled by BARBON and Sir Dudley NORTH. His description of wealth recalls the statement in Berkeley's *Querist*, that it consists "of the four elements, and man's labour therein." Even in his theory of interest, Hume had been anticipated by Barbon, and, more recently, by MASSIE. Nevertheless, the lucidity of his style, the subtlety with which the subjects of money and interest, in especial, are treated, and his connection with Adam SMITH, make Hume an important figure in the history of economics.

As an instance of his marvellous acuteness, may be noticed the letter addressed to A. Smith, on the appearance of the *Wealth of Nations*. After cordial congratulations, Hume proceeds at once to seize upon the points most open to criticism. "I cannot think that the rent of farms makes any part of the price of the produce, but that the price is determined altogether by the quantity and demand (*v.* RENT). It appears to me impossible that the king of France can take a seignorage of 8 per cent upon the coinage. Nobody would bring bullion to the mint, it would be all sent to Holland or England" (p. 286 in Rae's *Life of A. Smith*).

In tracing the development of wealth, Hume considers that the advance of agriculture promotes manufactures, by giving rise to superfluous hands. These must either find employment in manufactures or become soldiers. Sometimes the interests of the sovereign and the people are at issue, as to which the choice shall be. As a rule, however, even in the interests of the sovereign, it is well to have a manufacturing class, because they form a reserve fund upon which the state can draw in time of need. "Everything in the world is purchased by labour, and our passions are the only causes of labour." Hence, even avarice and luxury become spurs to industry. "The camp is loaded with a superfluous retinue, but the provisions flow in proportionally larger." MANDEVILLE (*q.v.*) is wrong, and vice, in itself, is never advantageous, but two opposite vices may be more advantageous than one alone. "By banishing *vicious* luxury, without curing sloth or indifference to others, you only diminish industry." Foreign commerce is justified upon similar grounds. "It increases the stock of labour." Imports furnish materials for new manufactures, and exports produce labour in commodities which could not be consumed at home. The acute remark is appended that foreign trade generally precedes refinement in the home manufactures, and gives birth to domestic luxury. In a noteworthy digression, Hume, following LOCKE, asserts strongly the claims of the labouring classes. A too great disproportion of property is a source of weakness. "Every person, if possible, ought to enjoy the fruits of his labour in a full possession of all the necessaries and many of the conveniences of life." The *power of the state* is thereby augmented, in its capacity to bear taxation.

In the *Essay on Money*, the error of those who held that money was more than a commodity is clearly demonstrated, but it is not clear how far Hume always kept himself free from the opposite error of holding it to be less. Money "is none of the wheels of trade; it is the oil which renders the motion of the wheels more smooth and easy." Men and commodities are the real strength of a community. In a single isolated country, the quantity of money can make no difference, while, in international commerce, the dearness of everything, including labour, which prevails in rich countries, ultimately enables poorer countries to undersell them in neutral markets. "It seems a maxim almost self-evident that the prices of everything depend on the proportion between commodities and money, and that any considerable alteration of either has the same effect, either heightening or lowering the price. Increase the commodities, they become cheaper; increase the money, they become dearer; as, on the other hand, a diminution of the former and that of the latter have contrary tendencies." Hence industrial preponderance is continually shifting. Modern improvements in transportation and labour-saving appliances may successfully check this tendency. But if a mere increase in the amount of money is not, in itself, a benefit, how comes it that it does, in fact, seem to promote prosperity? Hume's answer to this question is one of his most important contributions to economics. An increase in the amount of the precious metals is not followed at once by an advance in prices. "Though the high price of commodities be a necessary consequence of the increase of gold and silver, yet it follows not immediately upon that increase." It is only in the interval "between the acquisition of money and the rise of prices that the increasing quantity of gold and silver is favourable to industry" (*v. Money in its relations to Trade and Industry*, by F. A. Walker, London, 1880, pp. 84-87). Hume clearly points out that only circulating money and circulating commodities operate on prices. He does not, however, perhaps fully take into account the rapidity of circulation. Every absolute or relative increase in the amount of money need not produce a corresponding diminution in its value; the number of trade transactions may increase proportionally. In opposition to Locke and PETTY (*q.v.*), Hume demonstrates that low interest does not arise from plenty of money. High interest arises from a great demand for borrowing; little riches to supply that demand, and great profits from commerce. Low interest arises from the opposite circumstances. The class of landed proprietors is generally spendthrift, and, when it predominates, borrowers will be numerous, and the rate of interest high. Merchants on the other hand are generally frugal, and an increase of manufactures gives rise to a new lending class, and thereby lowers interest. Low interest and low profits mutually forward each other. It is idle to ask which is cause and which is effect; they both arise from an extensive commerce. "Interest is the barometer of the state, and its lowness an almost infallible sign of prosperity." Roscher finds in the essay on interest the first clear germ of the important doctrine that "a change in the channels of international trade, which in most countries is the only source of gold and silver, may make the price of the precious metals dearer in one place and cheaper in another, even while the conditions of the production of the mines remain entirely unaltered."

The essays of the *Balance and Jealousy of Trade* contain a clear statement of sound doctrine. "The more is exported of any commodity, the more will be raised at home, of which they themselves will always have the first offer." "I should as soon dread that all our springs and rivers should be exhausted, as that money should abandon a kingdom where there are people and industry." With his habitual caution, however, Hume safeguards himself. He approves of duties on foreign goods, which tend to encourage home manufactures. Still, the only commercial nations which need dread the improvements of their neighbours are such as flourish only by being brokers or carriers. With regard to taxes, the best are such as are levied upon consumption, especially those of luxuries, because these taxes are least felt. Hume denies that all taxes fall ultimately upon the land (see PHYSIOCRATS). If the artisan be taxed, he may be able to pay, by superior industry or by frugality, without raising the price of his labour. Before the spectacle of national indebtedness, Hume's usual optimism fails him. "Why should the case be so different between the public and an individual?" National debts enrich the capital at the expense of the provinces, put the country at the mercy of foreigners, and encourage an idle class of fund-holders. Public stocks are a kind of paper credit, and have all its disadvantages. The taxes, which the interest necessitates, either raise wages, or inflict hardships on the people. "Either the nation must destroy public credit, or public credit will destroy the nation . . . When I see princes and states fighting and quarrelling amidst their debts, funds, and public mortgages, it always brings to my mind a match of cudgel-playing fought in a china-shop." Repudiation would, however, soon be followed by a revival of credit. "Mankind are in all ages caught by the same baits: the same tricks . . . still trepan them. The heights of popularity and patriotism are still the beaten road to power and tyranny,

flattery to treachery, standing armies to arbitrary government, and the glory of God to the temporal interest of the clergy."

[The best edition of Hume's works is in four volumes, edited by T. H. Green and T. H. Grove, 1875, 8vo. The economic essays are in vol. i. of the two volumes of *Essays, Moral, Political, and Literary*.—J. Hill Burton, *Life and Correspondence*, 2 vols., Edinburgh, 1846, 8vo; and *Letters of Eminent Persons to D. Hume*, Edinburgh, 1849, 8vo, throw light on the economic side of Hume.—The chapter on Hume in J. Bonar's *Philosophy and Political Economy*, London, 1893, 8vo, brings out Hume's position in the history of economics.—Allusions to the essays will be found *passim* in the notes to Roscher's *Principles of Political Economy*, translated from the thirteenth edition by J. Lalor, New York, 1878, 8vo.—Walker's *Money*, New York, 1877, 8vo.—and Gibbs' *Colloquy on the Currency* are among the books which discuss his views on money and interest, London, 8vo.—John Rae, *Life of Adam Smith*, London, 1895, 8vo.—Prof. T. H. Huxley, *Hume*, in John Morley's Men of Letters series.] H. E. E.

HUME, James Deacon (1774-1842), entered the custom house at the age of sixteen. In 1822 he undertook the consolidation of the laws of the customs, which he completed in 1825. In his introduction, Hume states that he was "selected for this service for his supposed practical knowledge of the business of the department, and not for legal knowledge." This consolidation was termed by Huskisson "the perfection of codification." In 1815, according to the Custom Commissioners' Report of 1857, there were 1100 Custom Acts in force. All these, with the additions between 1815 and 1824, were repealed in 1825, by an act in which 443 statutes were enumerated, and the rest repealed by a general definition; thus sweeping away all the laws of the customs which had accumulated during the space of 550 years, and substituting eleven short plain acts contained in a volume of 411 pages. In 1823 Hume had been appointed controller of the customs, and in 1828 he was promoted to be secretary at the board of trade, a position he held till his resignation in 1840. In 1833 he contributed, under the initials H. B. T., some letters to the *Morning Chronicle*, "on the Corn Laws and on the Rights of the Working Classes," which were republished by him in the following year. He contributed articles in 1836 "on the Corn Laws" and "on the Timber Duties" to the *British and Foreign Quarterly Review*. He gave valuable evidence before the Committee of the House of Commons appointed in 1840 to inquire into the duties levied upon imports. In his evidence he stated that he disliked all treaties, except upon navigation. "I would take what I wanted and leave them (foreign nations) to find the value of our custom." He died in 1842, so that he did not live to see the final triumph of free trade. But there can be no question that, by the influence he exercised upon the mind and policy of Sir R. Peel, he did much to bring about that triumph. In the words of Sir James Graham, "the history of the board of trade from the time of Mr. Huskisson to the close of Mr. Deacon Hume's services at that board may be considered as the history of Mr. Deacon Hume himself."

Hume published *The Laws of the Customs*, 6 Geo. IV. c. 106-116, with notes, 1825-1832, 6 pts., 8vo.—*The Laws of the Customs*, 3 & 4 Will. IV., 50-60, with notes, 1833-36, 3 pts., 8vo.

[*Life of J. Deacon Hume*, by C. Badham, *Custom Commissioners' Report*, 1857, London, 1859, 8vo.] H. E. E.

M'Culloch, in his *Literature of Political Economy*, speaks somewhat slightingly of Deacon Hume's letters under the signature H. B. T., to the *Morning Chronicle*, which in his view "involve some very questionable and, as we think, wholly untenable positions," p. 80. Tooke, however, in *The History of Prices*, vol. iv. p. 106, speaks in a very different tone of these letters, and shows how accurate an observer Hume was "of events connected with the commerce of the country."

HUME, Joseph (1777-1855), was the son of a Montrose ship-master. He studied medicine, became a member of the College of Surgeons of Edinburgh, and in 1797 was appointed assistant-surgeon in the marine service of the East India Company. Later he was transferred to the land service of the company. Applying himself diligently to the study of the native languages and religions, he mastered Hindustani and Persian, and was employed by the administration in political duties. He filled in succession responsible posts in the offices of paymaster and postmaster of the forces, in the prize agencies, and in the commissariat. In 1807 he retired from the service, and returned to England with a fortune of £40,000. Hume now devoted himself to a study of the history and resources of Great Britain, and after visiting the whole of the agricultural and manufacturing centres of the United Kingdom, he spent some time on the continent, increasing his stores of political information.

In 1812 Hume entered parliament for Weymouth, having purchased two elections to the seat. He was at this time, and for a brief period subsequently, a tory. He opposed the Framework Knitters' Bill in the interest of the manufacturers. Upon the dissolution, in the autumn of 1812, the owners of the borough of Weymouth refused to re-elect him, when he took legal proceedings, and recovered a portion of the money he had deposited. While out of parliament he took a prominent part on the central committee of the Lancastrian schools, and closely studied the condition of the working classes, advocating the establishment of savings

banks. He essayed in vain to get elected upon the East India Board, but he was active in exposing abuses, and when the charter of 1793 expired he advocated freedom of trade with India, pointing out that it must result in an enormous expansion of commerce with the East. In 1818 Hume was elected as a liberal for the Border Burghs, and from this period until his death—with the exception of a brief interregnum—he held a seat in parliament, representing in succession the Border Burghs, Aberdeen, Middlesex, Kilkenny, and Montrose. During the whole of his career in the House of Commons he unflinchingly advocated financial and general reforms. He first drew attention to the enormously disproportionate cost of collecting the revenue, and compelled the appointment of a select committee, which reported in his favour. He opposed the scheme for the reduction of the pension charges, and in 1824 obtained a select committee on the combination acts. During the reform debates of 1831 he advocated the extension of representation to the colonies, and three years later he moved for the repeal of the corn laws. In 1835-36 he severely attacked the Orange Society, which was credited with a design to place the Duke of Cumberland on the throne after the death of William IV.

Hume was the sleepless watch-dog of finance, and mainly owing to his efforts the advanced radical party became known as the party of retrenchment. Every item in the returns of the public expenditure was subjected to his severe scrutiny—a task over which he expended much toil and money. He procured the abolition of the sinking fund, and it was he who reintroduced the fourpenny silver coin (see GROAT), which, however, has once more disappeared. He secured the repeal of the combination laws, as well as of those prohibiting the emigration of workmen and the exportation of machinery. He was an advocate of Catholic emancipation, of parliamentary reform, and of the repeal of the test and corporation acts. Hume was one of the trustees of the loan raised for the Greek insurgents, and was charged with jobbery in connection with it; but all that he did was to secure an advantageous liquidation of his holding when the loan was at a discount. He served on more committees of the House of Commons dealing with finance and the public service than any other member. Hume died, 20th February 1855; and Lord Palmerston, in alluding to the event in the House of Commons, observed that it was said of an eminent statesman (Burke) that he "gave up to party what was meant for mankind," whereas "the reverse might be said of Hume, who devoted himself first to his country and then to the general interests of mankind at large." A scholarship in political economy was founded in his memory at University College, London.

HUNDRED. The origin of the administrative division called a hundred in England has given rise to endless discussion among historians. There is no documentary mention of it until the ordinance of Edgar in the 10th century, and hence some have considered it a creation of that king. A tradition, recorded by William of Malmesbury, attributes the formation of hundreds to Alfred. On the other hand, the evidence of Tacitus and the analogy of all other German peoples would lead us to expect the existence of an administrative unit larger than the township and smaller than the tribe or kingdom. Moreover, the ordinance of Edgar does not read at all like the starting of an innovation, but only as regulating the use of an existing institution. Probably the best conclusion is that the English brought over with them the organisation of the hundred, but this name was by no means in universal use till the 10th century. In the western conquests, made after Angles and Saxons became Christian, the organisation may not have been introduced, while it may have fallen into decay in the north and midlands during the Danish wars. The effect of Edgar's ordinance would thus be to revive the hundred system where it had fallen into disuse, to extend it to districts where it had never been introduced, and to definitely fix its uses and arrangements.

The origin of the name hundred is even more obscure than that of the district to which it has been applied. It must at some time have had a numerical significance, such as the settlement of a hundred families or the district which sent a hundred warriors to the host, but it is quite impossible to trace such a meaning in England. The court of the hundred, which met every four weeks, consisted of the freeholders of the district with the parish priests and the reeve and four men from each township. It was the primary court of criminal jurisdiction in Anglo-Saxon times. The hundred was also the basis of military assessment and of the system of mutual responsibility, which in those days served instead of police. The organisation of the hundred was carefully preserved by the Norman kings as a counterpoise to the growth of territorial jurisdiction in the hands of the great barons. But it steadily decayed in the 13th and 14th centuries, and its place was supplied by the rise of the justices of the peace.

[*Essays in Anglo-Saxon Law* (Boston, 1876).—Stubbs, *Select Charters*, pp. 68-70.—Stubbs, *Constitutional History*, i. pp. 96-99.]

R. L.

The geographical division of the counties into hundreds continued, however, and for some purposes is still of practical importance. Thus in several counties the liability of the hundred for the repair of bridges continues, and the county councils have power, under § 3 of the Local Government Act of 1888, to assess and levy hundred rates. Up to the passing of the Riot (Damages) Act, 1886, the inhabitants of a hundred were, under a statute of George IV., liable in certain cases to pay compensation for damage done to property within the area of such hundred in the course of any riotous proceedings (for a modern instance of a claim made under the provisions of the statute in question, see Drake *v.* Tootitt, 7 Q.B.D. 201 [1881]).

The organisation of the rural police, until a comparatively recent period, also conformed to the division of counties into hundreds. The "high constables," whose office was abolished in 1867, had jurisdiction over their respective hundreds in the same manner as the parish constables over their respective parishes, and the division of counties into hundreds had to be considered in the arrangement of petty sessional divisions (see 10 Geo. IV. c. 46).

In more recent times the areas of the poor-law unions have been found more convenient intermediate units for the purposes of local government, and the rural districts created by the Public Health Act 1875 (see § 9)—the importance of which has been considerably increased by the Local Government Act 1894—are generally coterminous with these areas.

HUNDRED ROLLS. In 1274, soon after Edward I.'s return from the Holy Land, special commissioners were appointed to summon juries in the different districts throughout the country in order to inquire into the king's rights, royalties, and prerogatives, and into all frauds and abuses connected therewith, by which the crown suffered loss of revenue. This step had become necessary, for, owing to the encroachments of nobility and clergy during the troubles of the preceding reign, the resources of the crown had been seriously impaired. The results of the inquisitions held on this occasion make up the *Hundred Rolls*. These, therefore, contain particulars of (1) all demesne lands, and of manors which had been alienated from the crown; (2) tenants in capite and in demesne; (3) losses to the crown through sub-infeudations; (4) alienations to the church under pretext of FRANKALMOIGN; (5) wardships and other feudal rights withheld from the crown; (6) the crown's interest in fee farms, hundreds, wapentakes, and tythings; (7) *jura regalia*, such as wreck, free-chase, etc.; (8) illegal and excessive tolls on fairs, and for murage, pontage, etc.; (9) exactions and oppressions by crown officers; and (10) unlawful exportations of wool,—the whole forming one of the most valuable records ever compiled. The Hundred Rolls have been printed by the record commissioners in two large folio volumes with an introduction by W. Illingworth.

HUSBAND (AS TO WIFE'S PROPERTY). Husbands who were married before 1883 to wives possessed of property not settled upon them for their separate use, became entitled to extensive rights in respect of such property. All personal property actually in the wife's possession at the time of her marriage became the husband's property; debts owing to the wife became payable to the husband, if recovered within the wife's lifetime; if not recovered during the wife's lifetime the husband became entitled to them as administrator of his deceased wife's personal property. In addition to this, if any children were born during the marriage the husband acquired an indefeasible life interest in his wife's real property (he acquired "an estate by the curtesy"). All this has been materially altered by the Married Women's Property Act of 1882. Women who have married since the 1st January 1883 hold all their property as separate property, and the same rule is applied to property acquired after that date by women married before the commencement of the "Married Women's Property Act." A married woman may also dispose of her separate property by will without her husband's concurrence, and the only rights which remain to the husband are the absolute right to the wife's personal estate in case she dies intestate, and a life interest in her real estate in the same event, if there was a child of the marriage.

HUSKISSON, WILLIAM (1770-1830), the son of William Huskisson and Elizabeth (*née* Rotton), and educated at schools at Brewood, Albrighton, and Appleby in Leicestershire. In 1783 he was taken to Paris by his uncle Dr. Gem, where he remained for a long time, becoming private secretary to Lord Gower, the English minister, in 1790. On his recall Huskisson returned to England, and in 1793 was appointed to consider the position of the numerous French refugees with regard to the requirements of the Alien Act. In 1795 he became under-secretary for war and colonies, and in the following year entered the House of Commons as member for Morpeth. On Pitt's resignation in 1801 he withdrew from office, only retaining his under-secretaryship for a few weeks after that minister's retirement for the convenience of the incoming secretary. In 1804 he was appointed secretary of the treasury, passed into opposition in 1806, and resumed the position of secretary of the treasury in 1807. In 1810 he resigned with Canning; in 1814 was appointed chief commissioner of

woods and forests, a position which he quitted in 1823 to become president of the board of trade. Having sat in succession for several constituencies, he refrained from seeking re-election at Chichester after his new appointment in order to become one of the representatives of Liverpool. The remaining facts of his official life are few. In 1827 he was appointed colonial secretary, an office resigned in 1828. His death was caused by an accident during the opening of the Liverpool and Manchester railway in 1830.

Throughout his career Huskisson was remarkable for his firm adherence to the principles of sound economic reform. He was a member of the Bullion Committee (see BULLION COMMITTEE, REPORT OF), and in the currency discussion he took an important part in the protest made against an inflated paper currency, both then and in his writings laying down most clearly and vigorously the principles upon which a sound monetary system must be based. During his tenure of office at the board of trade he was responsible for important changes in the economic policy of the country. In the first place he modified the navigation system as affecting the colonies and foreign nations; with regard to the former, introducing changes which permitted direct trade to take place between the colonies and foreign countries in either British ships or those of the foreign nations thus concerned, but reserved the trade between the colonies and England. With regard to the foreign nations he carried a measure in 1825, which enabled the king in council "to place the shipping of any other country on an equal footing with our own, when that country was prepared to grant a similar favour in return." By this act Huskisson prepared the way for the final abolition of the Navigation Act, which, however beneficial in former years, was at the time a serious obstacle to the development of the trade of the country.

In the second place Huskisson began the policy of tariff revision and simplification which was afterwards undertaken by Peel and completed by Mr. Gladstone. This course he entered upon in 1824. His policy was twofold, the removal of the custom duties affecting raw material, and the reduction of the duties imposed on the import of foreign manufactures.

In these instances, as in the other changes of an economic character for which he was responsible—as for instance the repeal of the statutes prohibiting combination in 1825,—Huskisson displayed great moderation and foresight. The changes he made fully answered his anticipations. Too much praise, indeed, cannot be given to Huskisson for the courage he displayed in administrative economics. His knowledge of the details was wide, his grasp of principle firm; and though his speaking was not of the order of high oratory, it was lucid and persuasive, in short of the kind most fitted to the subjects with which he had to deal.

[See especially Huskisson's *Speeches*, 3 vols. —*The Question concerning the Depreciation of our Currency stated and examined*, 1810.—A Paper on the currency 1826 in which he recommends a double standard for this country—silver as well as gold—lately reprinted by the Bimetallic League.] E. C. K. G.

HUTCHESON, ARCHIBALD (late 17th century to 1740), barrister of the Middle Temple and member for Hastings. He agitated upon the questions of the national debt and the South Sea scheme. Having spoken on the first of these subjects in the last parliament of Anne, in 1714, he laid his proposals for its discharge before George I., and in March 1716, before parliament. He suggested devoting to its payment "so much as shall be sufficient of the estates real and personal of all the inhabitants of Great Britain . . . ; or by raising of new sinking funds, . . . or by borrowing at lower interest."

He advocated a more frugal expenditure of the public revenue, proposed the abolition of the excise and customs duties, so as to relieve the government of the burden of their collection, and was eager for free and fair elections, frequent parliaments, and the abolition of bribery and corruption.

Hutcheson published:—*A Collection of Treatises relating to the Public Debts and Funds, etc.*; and also *A Collection . . . relating to the South Sea Stock and Scheme*, London, 1721, fol.—*An Abstract of all the Public Debts remaining due at Michaelmas, 1722, and an Estimate of the Annual Sinking Fund towards the Discharge of the same, etc.*, London, 1723, fol.—*An Abstract of an Account stated by some of the Clerks at the South Sea House, relating to the Estates of the late Directors, etc.—The case of Contracts for South Sea Stock in General, etc.* (By A. H.) 1720, fol.—*A Collection of Advertisements, etc. . . . relating to the Last Elections of Westminster and Hastings. . . .* London, 1722, 8vo.—*Copies of some letters . . . from Mr. Hutcheson to the late Earl of Sunderland.* T. Payne, London, 1722, 8vo.—*An Estimate of the Value of South Sea Stock*, 1720, fol.—*Some Computations and Remarks relating to the Money, Subscribers, and the Proprietors of the Public Debts, etc.*, London, 1720.—*A Speech made in the House of Commons, 24th April 1716 (by A. H.)*, 1716, 8vo, 2nd edit. 1722, 8vo. A. L.

HUTCHESON, FRANCIS (1694-1746). Born in Ireland, but of Scottish descent, Hutcheson was appointed to the chair of moral philosophy in the university of Glasgow in 1727, and was thus a predecessor of Adam Smith. It is chiefly on account of the influence his writings are supposed to have had upon Smith that he is classed as an economist. He was one of the earliest propounders of what is known as the utilitarian doctrine of ethics; and his teaching

in this matter may be regarded as the foundation of the corresponding theory of economics, whose supporters included Smith, Bentham, and James Mill, and in a modified degree J. S. Mill. The following quotation from his inquiry concerning moral good and evil (§ 3) contains the kernel of this doctrine, compressed into remarkably few words. "In equal degrees of happiness expected to proceed from an action, the virtue is in proportion to the number of persons to whom the happiness shall extend." Bentham's often quoted ideal, "the greatest happiness of the greatest number," is to be found in Hutcheson. In his principal work, *A System of Moral Philosophy* (1742), there are many passages which foreshadow the theories subsequently developed by his great successor in the *Wealth of Nations*. Bk. ii. ch. vii. is a discussion on public and private property, the latter of which Hutcheson explains and defends in a manner somewhat different from that commonly employed by modern economists. He also examines the origin of capital, very much as Smith does. Chapters viii. and ix. of the same book are an expansion of the same subject; in the latter he deals with the subjects of contract. W. R. Scott, *Francis Hutcheson: his Life, Teaching, and Position in the History of Philosophy*, 1900.—See also the Introduction to Cannan's edition of Smith's *Wealth of Nations*, 1904, vol. i. pp. xxxvi.-xliii. M. G. D.

HUTCHINSON, JOHN HELY (1724-1794), a well-known Irish lawyer and statesman. Upon his marriage with the niece and heiress of Richard Hutchinson, he adopted that name.

He first sat in 1759 as member for Lanesborough, but from 1761-90 for the city of Cork. To quiet his violent opposition, the government made him privy councillor, and for subsequent services he was successively appointed prime serjeant-at-law, alnager, and in 1777 chief secretary of state. In 1774 he also obtained the provostship of Trinity College. In 1785 he accepted a peerage for his wife, who accordingly became Baroness Donoughmore. His greed of money and place won him the title of "ready-money-voter," and it cannot be denied that on more than one occasion he stretched his authority and influence to further his own and family interests.

But apart from this he was an able, if an unpopular, provost, and a clever and far-sighted statesman. Where his private interests were not concerned he followed the promptings of patriotism and public spirit. He was a fearless advocate of independence, of Roman Catholic emancipation, and of free trade; and one of his last votes was in favour of parliamentary reform. Hutchinson is best known to economists as the author of *The Commercial Restraints of Ireland*, a work which originally consisted of a series of letters to the lord lieutenant, Lord Buckinghamshire. It was published anonymously in 1779, but condemned to be burnt by the common hangman for its seditious doctrines. The advocates of free trade, however, gave it high praise.

The author is at pains to discover the causes which had ruined and were still ruining Ireland; and traces it to the selfish, and as he endeavours to show, suicidal, policy of the English parliament of 1699, which absolutely prohibited the exportation of Irish woollen manufactures. Hutchinson, very moderately, points out that, apart from its injustice, this policy was injurious to English interests; that one third of the wealth of Ireland was possessed by England, and that she would receive more than half the benefit of the woollen trade, and even at that price Ireland would obtain some prosperity.

In 1785 he repudiated the accusation of playing into the hands of the government, by his *Letter from the Secretary of State to the Mayor of Cork*, in which he put the case for the Anglo-Irish trade very plainly before his constituents.

He shows that no two countries on the globe are more necessary to the happiness and welfare of each other than these two islands, and advocates a noble equality and reciprocity of commercial tariffs.

The following is a list of his writings:
The Commercial Restraints of Ireland considered, 1779, 1780, 8vo.—*A Letter . . . to the Mayor of Cork on the Subject of the Bill presented by Mr. Orde, on the 15th Aug. 1785, for effectuating the Intercourse and Commerce between Great Britain and Ireland on . . . Equitable Principles, etc.* Dublin, 1785, 8vo.—*Mr. Hutchinson's Letter to his Constituents at Cork*, 1786, 8vo.—*The Speech of . . . J. H. H. . . . made in the House of Commons on the 26th day of June 1793, on the Resolution . . . respecting the Regulations of the Treasury Board*, Dublin, 1793, 12mo. A. L.

HUYSERS, ARIEN (died in 1806). A Dutch merchant and clerk in the service of the (Dutch) Company of the East Indies. Besides the biography of one of its governors-general, R. de Klerk (Amsterdam, 1787), he published a description of their settlements (*Beschryving der Oost Indische Etablissementen*), Utrecht, 1789, and reprinted in Amsterdam in 1792.

[Frederiks en Van den Branden, *Biographisch Woordenboek*, Amsterdam, 1888.] E. Ca.

HYPOTHEC (Scots Law). A lien or right existing at law in some particular cases, in favour of a creditor, by way of security over property of his debtor, while that property continues to belong to the debtor and to be in his possession. Examples of this are: the landlord's hypothec for rent, over the crop and stock of his tenant in a pastoral or agricultural holding, this hypothec having now been abolished by the Hypothec Abolition Act, 1880, so far as regards land exceeding two acres in extent; his hypothec over household furniture, etc., in houses, for

the rent; the hypothec of a superior or overlord for the last or current feu-duty or annual payment to him, this hypothec being over the crop and moveable property on the land, and being preferred above the landlord's hypothec for his rent; the hypothec of seamen over the freight and the ship for their wages; that of the shipowners against the cargo for freight; that of freighters over the ship against the shipowners for loss through mismanagement; and that of ship-repairers over the ship for cost of repairs in a foreign port. The law-agent's right of retainer of documents until paid is also called, in Scotland, his hypothec (see LIEN). A. D.

HYPOTHECA, the right of pledge or mortgage of a thing, constituted by mere agreement without any transfer of possession of the thing to the creditor. It sometimes means the thing thus pledged or mortgaged (see PIGNUS).

E. A. W.

HYPOTHECATION. A general expression for all transactions by which some property is mortgaged or pledged by way of security for a debt. The expression "letter of hypothecation" is frequently used for the document by which goods, the bill of lading relating to which is attached to a bill of exchange, are mortgaged to the holder of the bill, by way of security for the acceptance or payment of the same. As such goods have sometimes to be landed or re-shipped, and during the time before warrants or new bills of lading are issued may be in the possession of the mortgager or his agent, there was a doubt whether the letter of hypothecation did not have the effect of a BILL OF SALE (*q.v.*) and ought to be registered accordingly, but the Bills of Sale Act 1890 has made it clear that the registration of such a document is unnecessary. E. S.

HYPOTHESIS.

(1) The Illustrative Hypothesis, p. 348; (2) The Approximate Hypothesis, p. 348; (3) The Tentative Hypothesis, p. 349; (4) The Explanatory Hypothesis, p. 350; (5) The Working Hypothesis, p. 350; (6) Relations between the different types of Hypothesis, p. 350.

The word hypothesis is used in science to denote any supposition put forward as a premiss from which deductions are to be drawn. Hypotheses, however, differ in their essential character according to the purposes for which they are constructed and the uses to which they are put. Most of these varieties of application are exemplified in the writings of political economists. It will be convenient to treat the various kinds of hypothesis under different heads, and to give examples under each head of the ways in which hypothesis has been applied in political economy.

(1) *The Illustrative Hypothesis.*—Hypotheses of the first kind are those used in the exposition of complex phenomena. The purpose here is primarily didactic; the writer having in view the need of familiarising students with the conceptions appropriate to the subject. It is very usual to begin the exposition of any branch of economic study by describing phenomena of a much simpler character than the corresponding phenomena of actual economic life. Simple conditions of a definitely assigned character are laid down for illustration, without any implication that these necessarily accord with reality. Such a use of hypothesis may be called *Illustrative.* One of the best examples of such hypothesis is that used by Professor Nicholson in *Money*, ch. v. § 3. He begins his exposition of general prices by assuming an artificially simplified case in which it is supposed that money consists of counters only of use to effect exchanges, that no exchanges are made without the passing of money from hand to hand at every transaction, and further, that there is a definitely assigned distribution of commodities and of money among a given number of traders. Hypotheses of a similarly illustrative character are used by Mill and Bastable in their expositions of the theory of international values. They begin by assuming that there are but two nations in existence, that these nations trade only in two commodities, and that there are no expenses of carriage, etc., between the nations, or other items of mutual indebtedness, besides exports and imports. We may add that a mathematical treatment of the pure theory of exchange or of distribution necessarily employs simple hypotheses for illustration or exposition, as for example in the works of Cournot and Jevons. Such instances are too numerous to be recounted. Simplifications of this kind, used merely for illustration, and not supposed, at least in their initial form, to accord completely with facts, are necessary for the rigorous exposition of complex phenomena. Sometimes indeed a hypothesis is propounded which does not profess to answer to any possible or probable state of affairs; as, for example, when an investigation is made of the consequences that would follow from supposing that the amount of coin in circulation is suddenly doubled or halved, or that all the fixed capital of a country is suddenly annihilated. The uses of such hypotheses and the limitations to which they are subject are very instructively treated by Dr. Venn, *Empirical Logic*, ch. xvi. Hypotheses of the illustrative type tend to pass over into hypotheses of a somewhat different kind, to which we may refer under our second head.

(2) *The Approximative Hypothesis.*—Hypotheses made primarily with the purpose of simplifying exposition are often secondarily applied under the supposition that they accord, at least approximately or in the long run, with the nature of the phenomena to be expounded. Indeed the most useful form of the illustrative hypothesis is that in which, after beginning the exposition with the simplest possible description

of conditions, we introduce step by step further conditions till it is believed that all the essential circumstances of the case are included. Nevertheless the point of view of the expository hypothesis is essentially different from that of the hypothesis now to be considered. The propounder of the hypothesis now adopts the position that it expresses a true tendency; that even if the conclusions derived from it do not appear to accord with observation, yet this is only because counteracting agencies have concealed its operation. We are supposed to be dealing, not with fictions, but with abstractions. The use of hypotheses of this kind has been formally justified by Mill, Cairnes, and Bagehot. Undoubtedly the method of hypothesis in this sense is the most fruitful and potent instrument in the hands of the deductive economist. In almost all cases, the risk of error is eliminated if care is taken to express explicitly the precise assumptions employed. In this respect the use of a mathematico-analytic method has a very marked advantage over arithmetical or even diagrammatic expositions; for in the former every assumption must be explicitly formulated, while in the latter we are liable to introduce unnoticed relations between the numbers or points chosen for illustration. An example of errors arising from this source is to be found in the treatment by Ricardo and Mill of the effect on rent of agricultural improvements (Ricardo, *Principles*, ch. ii. § 31; Mill, *Political Economy*, bk. iv. ch. iii. § 4). Hypotheses which profess to represent actually operative tendencies, and are therefore intended to yield results true approximately or in the long run, are often adopted more or less unconsciously. It is in this unconscious employment that their main danger lies. For in such cases the writers have really believed that they were taking into consideration all the essential circumstances of the case, and that the conclusions deduced could be applied in practice to real concrete phenomena. They have often passed unawares from the standpoint of exposition to that of practical application. Hence the use of hypotheses has been sometimes too vehemently attacked by opponents of the deductive school. We may give a few examples of cases in which assumptions have been made more or less consciously and applied perhaps without sufficient qualification to concrete economic facts. Ricardo has been charged with assuming in his theory of value a fixed standard of comfort of the labouring population, or at least a standard determined independently of the play of ordinary economic forces. Again, the same writer and some of his followers have tacitly or explicitly assumed perfect *mobility* of capital and labour in their treatment of distribution and cost of production in domestic trade; while, as regards foreign trade, their theory of international values has been based on the assumption of the practical *immobility* of capital and labour as between nation and nation. Again, adherents of the wages-fund theory have often based their arguments on the tacit assumption that "the amount of wages that will be paid in any country in, say, a year, is fixed absolutely by the amount of capital existing there at the time" (Marshall, *Princ. of Economics*, 2nd ed. p. 573). Similarly, in maintaining the proposition "Demand for commodities is not demand for labour," Mill in one part of his argument assumes that "the consumer who hires labour postpones the consumption of the fruits of that labour to a later date than he who with an equivalent portion of wealth purchases commodities." One other less important example may be cited from Ricardo, who, in discussing the effect on rent of agricultural improvements, assumes that the demand for corn is absolutely inelastic. As regards many hypotheses that are adopted either as true or as approximately true in application to facts, it should be noticed that their logical character is often likely to elude the reader. For they are sometimes the suppressed premisses of an elaborately constructed argument, in which the conclusion which professes to be proved is to all intents and purposes merely a formal or verbal equivalent of the premiss suppressed.

(3) *The Tentative Hypothesis.*—Hypotheses in either of the above forms, illustrative or approximative, are used in the process of deduction, in which the course of the exposition is from the abstract to the concrete. Hypotheses of an apparently opposite type are also used in inductions from specific experience or explanations of concrete phenomena. Here the starting-point is—not some accepted law of nature—but an observed fact. This leads us to consider a third use of hypothesis, where the scientific imagination is called into play, to find some general formula adopted conjecturally which shall connect an empirically observed set of occurrences with a known law of nature. Such a hypothesis is put forward at first merely tentatively, with the clear recognition that it requires verification. The best example that can be cited of such a tentatively adopted hypothesis is the suggestion of Jevons that the periodicity of commercial crises might be connected with that of the sun-spots. Such a suggestion obviously awaited deductive or inductive verification; and Jevons has shown how, in the course of his investigations, a certain amount of verification was gradually obtained. This case derives a special interest from the fact that Jevons, as a logician, had emphasised the necessity for such tentative guesses in all inductive inquiry. But it would be difficult to find many examples of the inductive hypothesis in its purely tentative stage, because investigators have not as a rule recorded

guesses afterwards found not to accord with facts. Indeed the tentative hypothesis has rather a psychological than a logical interest, as indicating the mental process that must be gone through by an individual whose aim is the discovery of truth and the enlargement of knowledge and insight. Nevertheless, it will not be irrelevant to remark that workers in the field of statistics must have often tentatively brought into comparison two sets of phenomena, such as variations in the price of corn and in the marriage rate, with the view of examining whether the one set of changes can be so harmonised with the other as to suggest causal connection. A very similar investigation is made by Jevons (*Theory of Political Economy*, pp. 167-172), where he adopts a conjectural formula for expressing the relations between the supply and price of wheat in accordance with the estimates known as Gregory King's. This formula has since been amended by Mr. Wicksteed in the *Quarterly Journal of Economics*, April 1889.

(4) *The Explanatory Hypothesis.*—A hypothesis which has been put forward at first tentatively, with a view to future verification or refutation, comes after a time to be adopted as an explanatory theory when it has received some degree of confirmation. Such a theory is spoken of as a hypothesis, because it is not affirmed categorically, but is regarded as a premiss from which conclusions can be deduced which coincide with empirically observed facts or uniformities. The explanatory hypothesis differs from the tentative hypothesis mainly in respect to the point of view from which they are regarded. The latter indicates a stage in the process of *discovery*, the former is concerned with the question of *proof*. For the explanatory hypothesis is a theory regarded as deriving some degree of probability from its accordance with observations of fact. It differs from a law guaranteed by stricter induction in being avowedly subject to more or less doubt. A hypothesis used in explanations falls into one or other of two classes. It may be that the facts put forward as explanatory are not themselves in dispute, but only their causal connection with the phenomena to be explained. Or it may be that the facts put forward as explanatory are themselves open to question, though it is not denied that if true they would be adequate to explain the effect observed. The following are a few examples of hypothesis used in explanation of economic facts. Malthus, observing that the two countries Norway and Sweden closely resembled one another in their general economic conditions, and yet that the average proportional mortality was considerably higher in Sweden than in Norway, inferred that the difference was to be explained by the superior force in Norway of preventive checks to the increase of population due to certain governmental regulations and national sentiment and customs. Similarly, the difference in the prosperity of two similarly situated countries has been often hypothetically explained as the effect of the maintenance of a policy of free trade or of protection as the case may be. Or again, the fall in the gold-value of silver since 1874 has been explained as effect of the German demonetisation of silver; and the present depression in trade as effect of a scarcity of gold. In Adam Smith many hypothetical explanations of observed facts are to be found. He, for example, suggested that the impossibility of separating the different branches of labour employed in agriculture is the probable reason why improvements in agriculture have not always kept pace with improvements in manufacture. He gave numerous hypothetical explanations of variations in profits, in wages, in riches, etc., gathered from observations extending over large ranges of time and place.

(5) *The Working Hypothesis.*—The expression working hypothesis is in common use, but it seems to bear no universally recognised meaning beyond what is implied by the word hypothesis alone. The word *working* implies that the value attributed to such a hypothesis is due to the expectation that true results can be deduced from it, though in itself it has no claims to be regarded as true or even probable. It is adopted, at a particular stage of scientific investigation, to assist the mind in realising a mass of complex phenomena. In the theory of electricity, the hypothesis of one and that of two fluids are examples of working hypotheses. Similarly, the *social contract* of HOBBES and ROUSSEAU may in the same sense be regarded as a convenient fiction which enables us to understand some of the aspects of social evolution. The working hypothesis, as thus defined, is midway between the illustrative and the explanatory hypothesis. It is not merely illustrative, since it leads to results that agree with experience; but it can hardly be called explanatory, since its use does not depend on any belief in its truth or even its probability.

(6) *Relations between the different types of Hypothesis.*—Though we have hitherto been concerned to bring out the distinctions between different kinds of hypothesis, yet it is equally important to point out the mutual connections between them and to show how they are to be correlated in economic science. The expository hypothesis is derived primarily from generally accepted and comparatively simple laws of nature. It is of value in proportion to the extent to which its results are confirmed by facts directly observed and by uniformities directly generalised from experience. Conversely, the explanatory hypothesis is derived primarily from data of observation; but it is of value in proportion to the degree with which it is confirmed by deductive reasoning from

acknowledged laws of human, social, or physical nature. A complete method, therefore, requires that the processes of induction and deduction should supplement one another, each serving as verification of what is arbitrary or uncertain in the other. The hypothesis used in deduction keeps as closely as possible to the simple laws of human nature known to be actually operative; but, since actual phenomena are due to the composition of many concurrent tendencies, we can never be sure that all these tendencies have been taken into account, or that their comparative force has been correctly estimated. Similarly the hypothesis used in induction keeps as closely as possible to the actual facts of economic life ascertained by direct observation; but, since no mere generalisation is acceptable unless its dependence on fundamental principles of human nature has been exhibited, we must verify any inductively suggested explanation by showing how it may be derived from such fundamental principles. The consilience of deductive and inductive inferences is thus the ultimate criterion by which the value of every sort of hypothesis is to be measured.

[Mill, *Unsettled Questions of Political Economy*, Essay v.—Cairnes, *Logical Method of Political Economy*, *passim*.—Bagehot, *Economic Studies*, Essays i. ii.—Keynes, *Scope and Method of Political Economy*, *passim*, see also DEDUCTIVE METHOD; EXAMPLES; INDUCTIVE METHOD.]

W. E. J.

ICARIA. See CABET, ÉTIENNE; COMMUNISM.

IDDESLEIGH, THE EARL OF (1818-1887), better known as Sir Stafford Northcote, came of an old Devonshire family, and was educated at Eton and Oxford. He was intended for the bar, and in 1841 became private secretary to Mr. Gladstone, whose liberal views on finance and political economy he imbibed. His general political opinions, however, were conservative. In 1845 he accepted a permanent post in the board of trade, and two years later he became legal secretary to the board. During the debates on the navigation laws he published an able pamphlet on the subject which convinced the Duke of Wellington of the necessity and expediency of removing this vestige of the old protective system. In 1851 Mr. Northcote succeeded his grandfather in the baronetcy, and in the following year he rendered signal assistance to the Prince Consort as one of the secretaries of the great exhibition. His labours at this time were so exhausting that his health was seriously impaired, and the first symptoms of that cardiac weakness which afterwards proved fatal were developed. Rest restored his health considerably, and his joint labours with Sir Charles E. Trevelyan in connection with the report on the civil establishments of the crown (1853-54) led eventually to the establishment of the civil service commission, and the throwing open of the civil service generally to public competition.

Sir Stafford Northcote first entered the House of Commons in 1855 as conservative member for Dudley; he sat for Stamford from 1858 to 1866; and for North Devon from 1866 until 1885, when he was raised to the peerage as Earl of Iddesleigh. In 1858 he was appointed financial secretary to the treasury, and when Lord Derby's third administration was formed in 1866, he became president of the board of trade, an office which he exchanged in the following year for that of secretary of state for India. In 1871 he was nominated by Mr. Gladstone one of the special commissioners for the negotiation of the treaty of Washington, which had for its principal object the final settlement of the Alabama claims. The treaty was successfully concluded, and the long and bitter controversy between Great Britain and the United States finally closed. In 1874 Sir Stafford Northcote was appointed chancellor of the exchequer, an office for which he was eminently fitted. He had already published his important work *Twenty Years of Financial Policy: a Summary of the chief financial measures passed between 1842 and 1861; with a Table of Budgets*. In this work—which is one of the best efforts of recent times to record the effects of taxation, including local taxes—the author declared himself a disciple of the financial school of Peel and Gladstone. As chancellor of the exchequer he upheld the doctrines of free trade; and his financial policy included the final extinction of the sugar duties, and a slight increase in the tax on tobacco; the temporary reduction of the income tax to twopence in the pound, the lowest point it had reached from the first imposition of the tax; and the establishment and maintenance of an effective sinking fund, maintained generally by his successors. While out of office, Sir Stafford Northcote acted as chairman of an important parliamentary committee on the income tax, which his report contributed largely to sustain against the attacks of its enemies. From 1876 to 1880 he was leader of the House of Commons, in succession to Lord Beaconsfield. Besides being called upon to deal with parliamentary obstruction as a system, he had to grapple with many critical events, including the Russo-Turkish war, the Berlin treaty, the Zulu war, the Afghan war, etc. From 1880 until 1885 he led the conservative opposition, but a more robust leadership was desired in certain quarters,

and he was ultimately elevated to the House of Lords. He became first lord of the treasury in Lord Salisbury's first government, and secretary of state for foreign affairs in the second Salisbury administration; and was chairman of the Royal Commission on the Depression of Trade and Industry (1885-1886). The principles of Lord Iddesleigh's financial policy were thus defined by himself in a letter to Sir Reginald Welby (1875):—"1. Prudent, but not deliberately *under* estimates. 2. The habitual retention of a substantial surplus. 3. The retention of the income-tax at a low fixed rate, not to be disturbed for anything short of a national emergency. 4. The appropriation of a fixed annual sum to the charge for debt. 5. The avoidance of new taxes. 6. As a corollary, the toleration of old ones. Parliament and the country ought really to make up their minds to deal frankly and courageously with these matters, to eschew sensationalism, and to act on steady principles."

[*Twenty Years of Financial Policy* (1842-1861), by Sir Stafford Northcote, 1862.—*The Times*, Jan. 13, 1887.—*Life, Letters, and Diaries of Sir Stafford Northcote, first Earl of Iddesleigh*, by Andrew Lang, 2 vols., 1890.] G. B. S.

IDEAL, The Economic. However much an economist may protest that political economy is a science, not an art, and that it is no business of his to tell people what they ought to do, he can scarcely help assuming that both they and he have some ideal towards the attainment of which a knowledge of political economy is expected to assist. In English political economy this ideal has usually been considered to be simply the greatest possible creation of wealth. Whether this is a satisfactory ideal or not depends entirely on the way the formula is interpreted. To make it satisfactory:

(1) "Wealth" must mean average or *per capita* wealth. If it be taken to mean simply aggregate wealth without any regard to the number of persons who have to share that aggregate, this would make the ideal of economic progress "a human ant-hill" (Leroy-Beaulieu, *Répartition des richesses*, p. 126). We no longer believe, with Paley, that "in comparing adjoining periods in the same country, the collective happiness will be nearly in the exact proportion of the numbers, that is, twice the number of inhabitants will produce double the quantity of happiness" (*Moral Philosophy*, bk. vi. ch. xi.). We speak of countries as rich or poor according to the wealth enjoyed by each inhabitant, not according to the wealth of all inhabitants taken collectively.

(2) The creation or "production" of wealth must not be understood in such a way that it is merely equivalent to the accumulation of instruments of production and means of enjoyment. It must mean the creation of income, not the creation of capital. Accumulation is only useful in so far as it increases consumable income. Economists of the school of which M'Culloch was the chief representative were apt to regard the mere heaping up of goods as an end, and men only as the instruments employed in effecting this purpose.

(3) "Wealth" must be taken in its original sense, in which it means material welfare (cp. *Book of Common Prayer*, Prayer for the Queen's Majesty), not in the sense which many definitions have endeavoured to affix to it, of things possessing exchange value. It is a state or condition of human beings, not a number of objects or even objects and services. If wealth were taken merely as things possessing exchange value, and were measured by exchange value, the ideal of the greatest possible creation of wealth would be an extremely unsatisfactory one for two reasons. (*a*) It would be equally nearly approached whatever the quantity of painful labour expended in producing the wealth; two communities each with an income of £40 per head would have to be considered as equally near the ideal state even if the one had to work twice as hard as the other to procure that income. (*b*) It would be equally nearly approached however the wealth was distributed; two communities with equal incomes per head would have to be considered as equally near the ideal state, even if in the one the whole income was distributed without great inequalities, while in the other three-fourths of the whole went to one man. E. C.

IDEALIST. Like most words which are constantly employed to express praise or blame, the word idealist may be said to have lost all definite meaning. If we are to speak with philosophical accuracy, all changes, great or small, good or bad, which are effected by human will, are due to idealism. They are due to the faculty which enables man to conceive as possible and desirable a state of things different from that which actually exists. In this sense everybody is an idealist. But in practice it is convenient to reserve that appellation for persons who possess an imaginative faculty beyond the common, especially for those who conceive of society and life as dominated by some one principle which in the actual world can never find perfectly free play. Men of this type are undoubtedly the most powerful impellers, although not the most skilful executants of moral, political, and economical changes. Their idealism may take the most varied and contradictory shapes, and may be wholesome or pernicious. The believers in absolutely free competition, the believers in all-pervading state regulation, the believers in universal suffrage, and the believers in philosophical despotism, are alike idealists, although they contradict and vilify one another. The value of idealism, however, will depend on the intellectual and

moral endowment of the idealist, and especially upon his power of comprehending the actual world which he wishes to reform. F. C. M.

IDEAL MONEY is a term applied to certain species of currency which do not consist of a material thing such as coin, or notes convertible into such things. The principal species of ideal money are — I. Money of Account, and II. Inconvertible Currency.

I. (1) The simplest kind of money of account is that which was employed by the older banks, such as those of Venice and Amsterdam (see BANKS, EARLY EUROPEAN), where the unit was in effect a certain quantity of a standard precious metal. Thus at Venice the ducat banco was equal to 1·2 the standard ducat of the currency. So in the monetary system which was introduced into India on the advice of Sir James Steuart, "an ideal coin was invented by which all rupees might be valued" (Sir W. Hunter, *Rural Bengal*, quoted by Prof. Walker, *Money*, *sub voce* "Ideal Money," p. 594). Since the unit represents a definite quantity of precious metal, "a money of account of such a character is not properly an ideal money" (Walker, p. 295).

(2) Yet the term is applied not inaptly by Sir James Steuart to a certain money of account proposed by him, of which the unit corresponds to a definite quantity not of one but of two precious metals (*Political Economy*, bk. iii. ch. i.; and ch. xv.—an obscure passage, as to the interpretation of which see Lauderdale, *Depreciation proved*, p. 70 *et seq.*).

(3) A still more "ideal" money of account would be one referring not to two commodities only but to many, a tabular standard based on an Index Number (see INDEX NUMBERS). As explained in the article on that subject, the unit of such a currency might ideally be conceived as a certain quantity either of utility or of labour.

II. Inconvertible paper-money is in one sense less "ideal" than money of account, in that it consists of a material substance. But in another sense it is less real, since its value, depending on the quantity of the paper-money and the demand for it, does not conform directly to that of objects having INTRINSIC VALUE (*q.v.*) such as the precious metals or commodities in general. The quantity of an inconvertible currency may indeed be regulated so as to be brought into conformity with such standards; either with the value of bullion as contemplated by the older economists (*e.g.* Mill, *Pol. Econ.*, bk. iii. "On Inconvertible Currency"), or with the index number of recent theory. Some hint of the latter plan may perhaps be gathered from the writers who, during the bank restriction, advocated an "abstract currency," or "ideal money," . . . "not formed of substantial and therefore variable materials" (Gloucester WILSON, and Perceval ELIOT, quoted by Prof. Walker in *Money*). Perhaps they did not deserve the unbounded contempt which was poured on them by orthodox economists, such as CANNING (in the *Quarterly Review*) and PEEL (speech on the Bank Charter Act). But no doubt in the pursuit of the monetary ideal they often wandered into the realms of "nonentity and nonsense" (Canning). F. Y. E.

IDEOLOGUE. A contemptuous epithet applied by the first Napoleon to the philosophic liberals who kept alive in France the ideas of the 18th century, and assailed the imperial system with literary and social weapons. Napoleon felt the contempt of a man of action for those who merely talked and wrote about politics. His experience of the French Revolution had inspired him with a profound dislike of system-makers and rhetoricians. It must be added that he could not endure frank and independent criticism of his grandiose but immoral and impracticable political schemes, his fatal endeavour to make France the tyrant of Europe, and his reckless continental blockade. Having silenced this criticism in the French parliament and press, he proceeded in 1803 to suppress the department of the moral and political sciences in the Institute, which included such well-known names as Volney, Chénier, Cabanis, and Daunou. They continued the contest with Napoleon in a periodical known as the *Décade philosophique* (see DESTUTT DE TRACY). F. C. M.

ILLEGAL CONTRACTS. Contracts infringing a statutory prohibition, or deemed illegal at common law, or considered contrary to public policy, cannot be enforced in any court of law. Wagering contracts, and contracts in undue restraint of trade, and contracts made for immoral objects, are among the best-known instances of illegal contracts. A policy on the life of any person in which the insured has no insurable interest is deemed a wagering, and hence an illegal, contract. Contracts that are in fraud of creditors or of the bankruptcy laws are not enforceable. A contract is unlawful where goods are sold by improper weights or measures.

[Pollock, *On Contracts*, 7th ed., 1902.] E. S.

ILLEGITIMACY. All children born out of wedlock are and remain illegitimate according to English law. The rule of the canon law which enables parents by their subsequent marriage to give the rights of legitimate children to their previous issue, and which is applied in Scotland and most continental countries, has never been introduced into England. English courts would recognise children as legitimate whose parents at the time of their birth and at the time of their subsequent marriage were domiciled in a country in which "legitimatio per subsequens matrimonium" is recognised. Such children could not, however, in any case inherit by descent land situate in England. E. S.

IMMATERIAL CAPITAL AND IMMATERIAL WEALTH. The word capital has been made, at one time or another, to include every concrete good known to economics, many material and immaterial objects of desire not usually classed as goods, and even abstract conceptions hardly to be reckoned as objects of desire. These classifications are considered under CAPITAL (*q.v.*). We have here to consider the inclusion of immaterial entities under capital and wealth.

The commonest of these is "skill." Its inclusion under capital has been due to two analogies: (1) Skill is productive, and those who emphasise the productivity of capital naturally place skill under this head; (2) skill is costly. The expense of training a labourer of a specified grade of skill may be determined almost as accurately as in the case of a horse. In productivity and cost therefore skill is closely analogous to capital.

Against these analogies must be offset certain contrasts. (1) Skill, like fertility in soil, is not wholly the result of development. The cultivated man like the cultivated farm owes much in the way of productivity to investment, but the element of natural productivity, however hard to disentangle, cannot be ignored. A more marked contrast consists in the disposition of society towards a human creature as a commodity. A trained labourer is, in an economic sense, comparable to a machine or productive commodity having certain qualities of value; but for reasons happily beyond the pale of economics, society draws a deep distinction between the two (see WAGES). This distinction is artificial, but its profound importance cannot be doubted. Skill therefore resembles capital in being productive and costly; it differs from it in standing in a different relation to exchange and in many other respects. Convenience is the only just criterion for determining our classification.

The question therefore arises, What is usage on this point? It seems plain that when men apply the term "capital" to skill they do so in a purely metaphorical way, and that few things are more deeply contrasted in men's minds than labour and capital. The majority of prominent economists are also opposed to the inclusion of labour under capital. This inclusion causes economic questions to be regarded from an absolutely wrong standpoint, a habit which leads men to speak of dear labour in the same way in which they speak of dear coal. To make the similarity between these the basis of classification is certain to make men forget that from the social standpoint these are phenomena of exactly opposite significance.

Finally, we have to ask whether skill can be properly called immaterial. Good-will, patents, and guaranteed industrial privileges generally are often reckoned as immaterial capital. When a business pays an income greater than normal interest on its invested capital, it acquires an additional value known as good-will, and roughly equal to the capital which would produce an equal sum at normal rates. In the case of many companies this is covered by an issue of stock. This stock, which becomes indistinguishable from the original issues, merely capitalises this extra dividend-earning power of the business. The sale of good-will is but a clumsier mode of transfer. Good-will, etc., may properly be called individual capital, but there is no propriety in calling it immaterial unless the latter term is extended to all stocks, mortgages, etc. These have more properly been called representative goods or capital, *i.e.* mere titles to the ownership of other goods material or otherwise.

[Schäffle, *Ausschliessende Handelsverhältnisse* and Böhm-Bawerk, *Recht und Verhältnisse.*]

We have still to consider a quite different theory. Some economists have maintained that capital does not consist of goods but of a quality corresponding to an immaterial essence contained in those goods. Thus M'Leod speaks of capital as "purchasing power" or "circulating power," and adds that it "does not represent commodities in any way whatever." Kühnast calls it "a complex of productive, material values." More explicit is J. B. Clark, who distinguishes between "capital goods," *i.e.* goods employed for acquisition or production, and "capital . . . a permanent fund of productive wealth, expressible in money, but not embodied in money." He adds: "There is a long list of assertions that are true of capital goods, and that directly contradict the truth, if they are made concerning true capital, or a permanent productive fund." It will be observed that he does not claim that capital is immaterial, and Kühnast speaks of it as "a complex of productive, *material* values," but it seems necessary to make capital immaterial if we are to distinguish it from goods. Otherwise the distinction vanishes or reduces itself to a mere difference in point of view. The last is probably Clark's meaning.

The first question is as before one of usage. Clark finds the double concept in popular and scientific use but unconsciously confused. Men recognise capital as a permanent fund expressed in money, while they recognise capital *goods* as constantly consumed and replaced. The distinction, however, is not certain. Men estimate capital in money, though it is composed of concrete goods, because heterogeneous goods have no other fact in common than value. When for other purposes people enumerate the items of their capital in a more exact way, this does not imply that they are talking of a different

thing. Nor does the fact that capital is spoken of as permanent, while goods are known to be transient, imply anything more fundamental. A herdsman, who buys and sells cattle continually, may say that he keeps a herd of a hundred cattle without implying anything else by the term herd than the shifting aggregate of cattle in his possession. A merchant who speaks of his stock would be surprised to learn that he is talking about something else than the goods in his shop.

The question whether there is utility in such a distinction if established is not easy to discuss. It has found no clear expression in popular speech, and few economists have used it. It is not clear that any important economic truth is dependent upon it or cleared up by it, though such a judgment may be premature. If unnecessary, a distinction so subtle should certainly be abandoned in the interest of simplicity. While it is important to recognise the constant consumption and replacement of capital on the one hand and its position as an aggregate permanency on the other, it is not clear that a redefinition of capital is desirable to that end.

[All important works on economics contain discussions of CAPITAL. See especially Mill, *Principles*, vol. i. bk. i. ch. iv. — Sidgwick, *Principles of Pol. Econ.*, bk. i. ch. v., 2nd ed. 1887.—Marshall, *Principles of Economics*, vol. i. bk. ii. ch. iv., 3rd ed. 1895.—Jevons, *Theory of Pol. Econ.*, ch. vii., 2nd ed. 1879.—Walker, *Political Economy*, pt. ii. ch. iii. 1883. By far the best general survey of the field of literature on this subject is found in Böhm-Bawerk, *Kapital und Kapitalzins*, admirably translated by Smart.]

H. H. P.

IMMATERIAL RIGHTS (see INCORPOREAL PROPERTY).

IMMEUBLES (Fr.) One of the two classes into which property is divided in France. The other is *meubles*. Those terms correspond in a measure to realty and personalty in England. The words immovables and movables do not apply strictly, as there are numerous exceptions on both hands. Properties are *immeubles* by reason of their nature, or the purpose for which they are intended, or on account of the subject-matter with which they are placed in relation (Civil Code, art. 517). The first category comprises land, houses, buildings, crops ungathered, etc.; the second includes animals attached to the farm, straw and manure, the inmates of rabbit-warrens, pigeon-cots, beehives and fish-ponds, implements and utensils for working farms and factories, etc.; the third, usufructs, right of way and other servitudes on *immeubles*. Art. 528 of the Civil Code classes as *meubles* by their nature properties that may be moved from one place to another, either by their own action, such as animals, or by extraneous force, like inanimate objects; thus ships are, by art. 531 of the Civil Code, and art. 190 of the Commercial Code, declared to be *meubles*, they may however be mortgaged under laws of 1874 and 1885, contrary to the provisions of art. 2119 of the Civil Code, which states that no right over *meubles* can be acquired by a *hypothèque* (mortgage) of property remaining in the debtor's possession. The procedure for the execution of judicial seizures differs for the two classes of property.

T. L.

IMMIGRATION. The early history of immigration corresponds to that of COLONIES and EMIGRATION, and reference is made to those articles. By immigration is meant that movement by which persons, on their own responsibility, seek settlement in new countries with the intention of becoming permanent residents there. There is also temporary immigration, as of Italians into France during the harvest season, of French Canadians into the United States during the building season; but these movements are of local importance and cannot be treated generally. Permanent immigration, on the other hand, is a demographic and economic phenomenon of great importance to new countries such as the United States, Canada, Australia, the Cape colonies, and the republics of South America.

Immigration differs from colonisation inasmuch as the immigrants do not form a new community themselves, but are projected, so to speak, into a state and social organisation already formed, where they undergo a process of absorption and assimilation. When the new country is an independent one (*e.g.* the United States), all political and to a large extent social connection with the country of emigration is broken off. And even where the emigrant seeks a colony of his native country, many of these colonies are in modern times so nearly autonomous that the political and economic influence is much the same as if he had changed his allegiance.

The importance of immigration lies in two directions—namely, in the effect upon the happiness and well-being of the immigrant himself, and in its effect upon the community which receives him. In the history of immigration there have doubtless been frequent abuses, many cases where the immigrant has been deceived by false representations, or has made a mistake, so that he has found himself worse off abroad than he was at home. In many cases he has been unable to cope with the difficulties of the new life, and has either returned home a sadder man or been overwhelmed by adversity. But in the great majority of cases the immigrants have prospered and attained a position of comfort which they would never have reached at home. A more difficult question is the influence of immigration upon the countries which receive the immigrants. In the early history of new countries, additions to the labour-force have always been welcomed as

so much aid in the great contest with nature involved in opening up and settling waste tracts of land, in making them accessible by roads and railways, and in carrying on the general work of improvement. Later on, as the community begins to be more self-sufficing, and to feel more self-conscious, questions arise as to the *quantity* and *quality* of the immigration, whether it can be readily assimilated, and whether its character is such as to change the type of civilisation already established and which the community values. This is the modern immigration problem. It can best be studied by the experience of the United States of America, where immigration has been going on for the longest time and on the greatest scale (see art. on EMIGRATION).

Statistics of Immigration to the United States.—Prior to 1820 there was no official record of immigration, but it is estimated that the total number of immigrants from the close of the revolutionary war to 1820 was 250,000. Prior to 1856 the records indicate the arrivals of alien passengers only, but it is estimated that 98 per cent of these were immigrants. The general course of the movement is shown by the following table:

Immigration by Decades.

Decade ending with	Aggregate arrivals.	Annual average.
1830 . . .	143,439	14,343
1840 . . .	599,125	59,912
1850 . . .	1,713,251	171,325
1860 . . .	2,598,214	259,821
1870 . . .	2,314,824	231,482
1880 . . .	2,812,191	281,219
1890 . . .	5,246,613	524,661
1900 . . .	3,844,420	384,442
1901-1904 . .	2,809,068	702,267
Total . .	22,081,145	

In the total number from 1820 to 1890, and from 1895-1904, the principal countries are represented as follows:

Country.	1820-1890.	1895-1904.
Germany . . .	4,504,128	276,246
British Isles . .	6,235,277	560,551
Norway, Sweden, and Denmark . .	1,067,548	384,932
Austria-Hungary .	434,488	1,018,376
Italy . . .	388,558	1,134,233
France . . .	366,346	33,788
Russia, Poland, and Finland . .	324,892	767,600
China . . .	290,655	19,237
Switzerland . .	171,269	very small
		1901-1903.
Japan . . .	...	39,507

The proportion from the different countries has varied. From 1821 to 1860 inclusive, over one-half of the whole immigration was from England and Ireland, the greater portion from Ireland. During 1861-70, 1871-80, 1881-90, 1895-1904, the proportions were as follows:

Country.	1861-1870.	1871-1880.	1881-1890.	1895-1904.
	Per cent.	Per cent.	Per cent.	Per cent.
England . .	24·54	16·88	12·53	12·11
Ireland . .	18·82	15·54	12·49	
Germany . .	34·02	25·54	27·70	5·96
Austria-Hungary	·34	2·60	6·74	21·98
Norway and Sweden . .	4·72	7·51	10·84	8·31[1]
Russia & Poland	·20	1·86	5·05	16·58[2]
Italy . . .	·51	1·98	5·86	24·48

[1] Includes Denmark. [2] Includes Finland.

Sex.—During the decade 1880-1890, 61·10 per cent of the immigrants were males and 38·90 per cent were females.

Country.	Total.	Males of total.	Females of total.
		Per cent.	Per cent.
Germany . .	1,452,970	57·6	42·4
Ireland . .	655,482	51·0	49·0
England . .	644,680	61·3	38·7
Sweden & Norway	568,362	61·0	39·0
Italy . . .	307,309	79·4	20·6
Russia including Poland .	265,088	65·8	34·2
Austria . .	226,038	62·9	37·1
Hungary . .	127,681	73·8	26·2
Scotland . .	149,869	61·6	38·4

1904.—Males, 67·6; females, 32·4.

Age.—Of the immigrants arriving in the United States during the 10 years from 1881 to 1890, 21·4 per cent were under 15 years of age, 68·1 per cent were from 15 to 40 years, and 10·6 per cent were over 40 years of age.

Country.	Under 15 years.	From 15 to 40 years.	Over 40 years.
	Per cent.	Per cent.	Per cent.

Hungary . .	14·7	74·9	10·4

Occupation.—The statistics show that only 10·35 per cent of the immigrants belong to the professional and skilled artisan classes. The remainder are unskilled labourers, women, children, or without occupation.

Causes.—Immigration varies considerably from year to year. Commercial distress in Europe drives immigrants to America, as after the Irish famine of 1846, and the German dearth

of 1853. Bad times in the United States discourage immigration, as during the civil war (in 1861 the immigration sank to 89,724), and the financial panic of 1873, after which the number sank steadily down to 1878, when it was only 138,469. The highest numbers were in 1882 when 788,992, and in 1903 when 857,046 immigrants landed in the United States. Aside from this general economic influence, there are two forces in constant operation which tend to keep up a regular stream of immigration. The first of these is the communication between immigrants and their friends at home. Thousands of letters are sent back annually urging their friends and acquaintances to follow them, and hundreds of thousands of dollars are remitted in order to pay the expense. The custom of the steamship companies in selling prepaid tickets greatly facilitates and encourages these efforts. This attractive force remains constant from year to year, although of course it is more active in good times when money is plentiful and places can be found for the new arrivals. A second powerful force in modern times is the activity of the great steamship companies. Enormous steamships sailing regularly every week must be filled. Competition is very keen, and hence each company has thousands of agents scattered through Europe for the purpose of inducing emigration, and thousands of agents scattered through America, selling prepaid tickets on commission. There is thus an artificial stimulation to immigration, inasmuch as the opportunity is given to all sorts of persons and the way made easy. In former times it required considerable energy and some money for a man to emigrate. At the present time it requires but little money and less energy. At various periods foreign governments, especially local authorities, have assisted criminals, paupers, and other undesirable persons to emigrate, but this has now generally ceased owing to protests from the side of the countries receiving the immigrants. So also at various periods new countries have sought to attract immigrants either by paying their passage or by giving them land and the means of settling; but this has generally ceased as the need for labour has become less pressing. The movement at the present time, therefore, is a purely commercial-industrial one, dependent, on the one hand, on the interests of transportation companies and, on the other hand, upon the supposed economic interests of the individual immigrant. It differs, therefore, from the movement of the 18th century, in which religious, political, and patriotic motives were more or less involved, and is to be treated principally from the economic standpoint. Immigration to the United States was affected by the cholera scare of 1892 and the panic of 1893. For the four years 1891 to 1894, and for the year 1904, the figures are as follows:

Year ending June 30th.	
1891	560,319
1892	623,084
1893	502,917
1894	314,467
1904	815,361

Such being the facts in regard to immigration we go on to inquire its effect on the population and economic condition of the United States.

Effect on Population.—It would seem that immigration must increase population by the number of immigrants and their descendants; and as the majority of the immigrants are in the most productive ages of manhood and womanhood, the natural increase of the population must be greatly accelerated. As, however, in the United States there is no complete registration of births and deaths, and as even in such registration as exists no distinction is made between natives and foreigners, we cannot determine what proportion of the present population is due to immigration since 1820. The census of 1900 returned 26,198,939 persons who were either foreign born or who had one or both parents foreign born. This represents approximately the population of foreign descent for two generations. But the immigrants of the earlier years are now represented by grandchildren or by great-grandchildren—that is, by the third and fourth generation, so that the above figure is entirely inadequate. If we should represent the survivors in the third and fourth generation by 5¾ millions, we should have the number 31,948,939 as representing the portion of the population due to immigration. A similar result is reached by taking the annual immigration since 1820, and applying to it the rate of natural increase for the whole population. We have no means of knowing, it is true, whether the rate of natural increase is the same for the foreign born as for the native born. It is probably greater, so that our result will be a minimum. Such a calculation gives us for 1900 about 32,000,000 descendants of immigrants, and 36,000,000 descendants of the white colonists.

It is sometimes denied that immigration has had any very decided effect in absolutely increasing the total population of the United States. It is said that the pressure of immigration has retarded the natural increase of the native population, so that the immigrants have simply taken the places which would otherwise have been filled by native-born Americans. The decreasing size of the American family is cited as proof of this tendency. We have no exact statistics upon this point. The census of Massachusetts (1885) showed indeed that the foreign-born women had a larger number of children than the native-born, but that there was a greater mortality among them. The just conclusion seems to be that while immigra-

tion is not a clear gain to the population, yet it acts as a powerful stimulus.

A more important result of immigration has been to introduce into the population of the United States great ethnical groups which are separated from each other either by race, by origin, or by parentage. The population of the United States consists now of the four groups shown in the following table:

Population of the United States according to colour, birthplace, and parentage, 1900.

Total population .	76,085,794	100·00%
Native White, native parents . .	41,046,467	53·94%
Coloured population.	8,840,388	11·62%
Foreign White . .	10,460,085	13·75%
Native White, foreign parents . .	15,738,854	20·69%

We have here four different elements entering into the population of the United States. The native Americans, that is, the native whites whose parents are native born, number a little over one-half of the total population. Upon this native American element is imposed three elements different either in race, or in birthplace, or in parentage. The first is the coloured, 11·62 per cent of the total population, composed principally of negroes. The second element, 13·75 per cent, is composed of white persons born abroad, that is, the survivors of the immigrants. This is the element by which the foreign influence on the institutions and people of the United States is exercised. The third element consists of native white persons whose parents, one or both, were foreign born. They may be called the second generation of the immigrants. It is evident that there may be, and probably is, an important difference between these last two classes. The native-born whites of foreign parentage are not to be regarded entirely as foreigners. Born in America, educated in the public schools, learning the English language, they have been subjected to the assimilating influence of American life. These assimilating influences are principally intermarriage, the exercise of political rights, common school education, and social intercourse with the native Americans. It is an important fact that in most of the states the second generation of the immigrants is already more numerous than the first. This indicates that the assimilating influences have a good field in which to work. On the other hand, there are also indications that the assimilating influences have thus far been effective. For otherwise we should certainly find great differences in language, customs, and laws in different portions of the United States, due to the different elements introduced into the population by immigration. The United States would seem to offer in this respect a unique opportunity to study the question of the mixture of races or of nationalities. This, however, is a complicated sociological study into which we cannot enter here.

Economic Effects.—There is no doubt that the rapid development of the material resources of the United States has been greatly aided by immigration. It has furnished the labour-force necessary for the arduous task of opening up a new country, building railways, digging canals, exploiting mines, starting factories, and founding cities. In 1880 nearly 10 per cent of all the persons engaged in agriculture, 25 per cent of those in trade and transportation, and nearly one-third of those employed in manufacturing, mechanical, and mining industries, were of foreign birth. The domestic servants were for the most part females of Irish, German, or Swedish birth. The ordinary craftsmen, such as bakers, butchers, blacksmiths, coopers, masons, plasterers, etc., were largely immigrants or their descendants. The same is true of the employees in cotton, woollen, iron and steel, leather and other factories. A curious fact is that while the immigrants are, upon their arrival, mostly common labourers or agricultural labourers, yet only 23·32 per cent were found employed in agriculture, while 34·89 per cent were employed in mechanical, manufacturing, and mining industry. Doubtless great numbers were employed in the merely mechanical branches of these industries, but the figures show that the unskilled labourer can be readily trained to factory work.

A corresponding fact is that while the immigrants are for the most part from the rural districts of Europe, they congregate after arrival in the larger cities. In 1900, 49·5 per cent of the foreign born were found in cities of 25,000 inhabitants and over. This movement is due partly to the ignorance, inertia, and poverty of many of the immigrants, which retain them in the cities of the east where they land, instead of pushing them forward to the unoccupied lands of the west; and partly to the modern preference for city rather than country life. It has important economic influence both for the immigrants and the country receiving them. It means a change of occupation and social environment for the immigrant, and an intensification of the movement towards cities which is one of the characteristics of modern civilisation. This movement in America has been accelerated by immigration.

Many attempts have been made to measure the direct economic gain to a country by immigration. There are two items to be considered; first, the money or capital which the immigrants bring with them; second, the economic value of the immigrants themselves. The amount of money brought by the immigrants to the United States is not large. For 152,360 immigrants landing at the port of New York during the first six months of 1892,

it was returned as $20.09 (£4) *per caput*. This is offset by the large amounts of money sent back to Europe by the immigrants to aid and support their friends or to assist them to emigrate. It has also been suggested that the amount of wealth brought by the immigrants is much less than the *per caput* wealth of the people of the United States, estimated at $1000.00 (£200), so that the average well-being is not increased.

The real economic gain to the United States by immigration consists in the value of the full-grown labour supplied to it by the countries of Europe. Various attempts have been made to estimate this in money. One way is to consider every full-grown immigrant as worth to the United States the cost of his bringing up to the age of fifteen. Estimating that at $1000 (say £200), the 315,054 immigrants in 1890 between the ages of fifteen and forty would represent an enormous sum, $315,054,000. A second method of estimating the economic value of the immigrant is to capitalise his future earnings over and above his future cost of subsistence, according to his probable after-life. This sum will represent the amount of wealth he may be expected to add to the community before he dies. Dr. Wm. Farr estimated the net future value of immigrants from Great Britain on this plan as £175 *per caput*. The money value of an annual immigration of 500,000 souls would be $437,000,000 (say £87,400,000). In fact, as wages are higher, and cost of living not proportionately greater in the States, the real gain would be considerably more.

All these attempts to put a money value on the economic gain by immigration are fallacious. An immigrant is worth the cost of bringing him up only if he becomes an honest, industrious, able-bodied labourer. If he is vicious, idle, or infirm, then he is only a care and a burden to the community that receives him. So, also, there is no real capitalised value of his future earnings unless there is a demand for his labour. Immigration is of economic value to a country if the immigrants can be usefully employed. That is not a matter for statistical computation, but for general observation. The considerations which are of importance from this point of view are as follows:

(*a*) The need of unskilled labour in the new countries is much less pressing than it was forty years ago. This is due partly to the increase of population, partly to the employment of machinery on a grand scale, and partly to the fact that the most productive lands have been occupied. We have the same complaints in regard to lack of employment in new countries as in old. The tendency of the immigrants to congregate in large cities instead of spreading over the country makes the congestion of labour still more acute. Immigration has passed beyond its first phase, where any and every sort of labour force was welcome for the purpose of opening up the country. A sign of this is seen in the general cessation of governmental efforts to stimulate immigration, and the indifference, not to say hostility, with which continued immigration is viewed.

(*b*) The immigration of criminals, paupers, persons diseased in mind or body, and persons unable to support themselves, is a direct economic and social detriment to the community. Since 1882 such persons have been refused admittance to the United States, and, when rejected, the steamship companies that brought them have been obliged to carry them back. Statistics for the United States show that the burden of public and private charity has been greatly increased by the indiscriminate admission of immigrants of all classes. No law of international comity is violated by the refusal to receive these unfortunates. They should be taken care of at home.

(*c*) Immigration sometimes increases the competition in the labour market, and thus lowers wages. It is often denounced by labour organisations on this account. One case is particularly aggravating, viz. when the employers import foreign labourers to take the place of their men who are on a strike. This renders all organisation of labour futile. The law of 1885 in the United States, commonly called the Labour Contract law, forbids the entrance of persons who are already under contract to labour there. But it is extremely difficult to prove the existence of such a contract. Outside of this particular case it does not appear that the ordinary competition due to immigration is felt by the labouring class in a new country where that competition is on the same plane of living.

(*d*) Immigration of masses of men accustomed to a lower standard of living than prevails in the new country may have a disastrous effect on the economic well-being of the community. An example of this is the Chinese immigration into the States (practically prohibited in 1882). The Chinese are industrious and thrifty, but they live in a way impossible for the American workmen to imitate. They never assimilate with the Americans or adopt western civilisation. Besides the social danger arising from the presence of such an alien element in a new country, there is the economic danger lest the standard of living of the whole labouring class should be brought down to their level. Some of the recent immigration from southern and eastern Europe raises the same question.

Restriction of Immigration.—Legislation in the United States has attempted to meet the dangers noted under the last three heads. The act of 1882 mentioned above has been

supplemented by the act of 1893, which provides for the exclusion of idiots and insane persons, paupers or persons likely to become a public charge, or suffering from a loathsome or dangerous contagious disease, convicts, polygamists, and contract labourers. The number excluded under the former acts was in 1890, 535, in 1891, 1026, and in 1892, 3732. The contract-labour law of 1885 excludes persons coming under contract to labour. The Chinese exclusion policy adopted in 1882 was made more severe by the act of 1888, which forbade the return to the United States of Chinese labourers who had left there, and by the Geary Act of 1892, compelling the registration of Chinese on pain of deportation. The latter act has not been enforced.

Future Policy in regard to Immigration.—There is no doubt of the political right of a country to restrict or prohibit the immigration of persons whom it considers undesirable. During mediæval times such restrictions were universal. They fell into disuse owing to the increased facilities of communication between countries and the modern spirit of individual liberty. But a state must be sovereign in its own territory, and hence must have the right to exclude persons whose presence it regards as detrimental to its civilisation. In fact, we may say that this is the highest duty of a state, viz. to preserve its standard of civilisation. International comity demands that trade and travel should not be unnecessarily embarrassed, and that prohibitions should be directed against individuals as such and not against nationalities or races, unless the race as a whole proves incapable of assimilation. Numerous political and social effects are connected with immigration which prevent its being treated simply as an economic question. In a democratic country like the United States rapid immigration and easy methods of naturalisation throw political power into the hands of the immigrants, who are often ignorant, unaccustomed to the exercise of political rights, and sometimes venal. The foreign-born males of twenty-one years of age and over constitute 23·78 per cent of all the males of that age. In some of the western states and in many cities they constitute more than one-half. The social effects are felt in the abnormal number of the foreign-born in the poor-houses, asylums, hospitals, and prisons. Their participation in crime is not so disproportioned to their number if we take into consideration that the immigrants are mostly adults. These social effects influence legislation, and in the future the restrictive policy will be more or less severe according as the pressure of immigration is more or less keenly felt by the labouring class, and increase of crime and pauperism, outbreaks of anarchism and other social evils, are attributed by public sentiment to immigration.

Other Countries.—In the British colonies the question of immigration seems to be in almost the same stage as in the United States, only the movement has been smaller and the evils less felt. In Australia we find the same prohibition on Chinese immigration, and the same jealousy of the working-classes in regard to competition in the labour market. The countries of South America welcome immigrants more gladly, but many complaints are heard of the way in which they are treated.

[Besides the Bibliography in Richmond Mayo-Smith, *Emigration and Immigration*, New York and London, 1890, the following recent publications may be mentioned: *Quarterly Reports of the Chief of the Bureau of Statistics*, Treasury Department (No. 2, 1892-93), Washington, 1893—*Report of the House Committee on Immigration and Naturalisation*, Washington, 1892.—*Correspondence relating to Chinese Immigration into the Australian Colonies*, Parl. Return, 1888.—*Indagini sulla Emigrazione Italiana all' Estero*, Roma, 1890.—Rossi, *Del Patronato degli Emigranti*, Roma, 1893.—Philippovich, "Die Vereinigten Staaten und die Europäische Auswanderung," in Braun's *Archiv für Sozialegesetzgebung*, etc., vol. vi. No. 2, Berlin, 1893.—Report by Burnett and Schloss on *Immigration into America*.]

R. M-S.

IMMORAL CONTRACT. See ILLEGAL CONTRACT.

IMMOVABLES. By "immovables" is primarily meant such things as lands and buildings that cannot be moved. The term is used in a secondary meaning as including rights over immovable things. "The only natural classification of the objects of enjoyment," says Sir Henry Maine (*Ancient Law*, London, 1861, p. 273), "the only classification which corresponds with an essential difference in the subject-matter, is that which divides them into movables and immovables."

[As regards the historical development of the distinction, see Maine's *Ancient Law*; as to the importance of the distinction in modern law, see Foote's *Private International Jurisprudence*, 3rd ed. 1904.] J. E. C. M.

IMPEACHMENT OF WASTE. A tenant for life of an estate—unless expressly declared to be "not impeachable for waste"—is not allowed to do any act, such as cutting down trees or opening mines, that would injure the inheritance. Such acts are called waste (see WASTE), and the tenant is said to be liable or impeachable for waste.

[Goodeve's *Real Property*, London, 1891.]

J. E. C. M.

IMPERIAL. Russian gold coin of the value of fifteen roubles. Weight, 199·1 grains; fineness, 900. Value (English standard) £1:11:8·79, (French standard) 40 francs. Half-imperials are of the same fineness, and of proportionate weight. Prior to 1886 the half-imperial was 916·6 fine and weighed 101 grains. F. E. A.

IMPORTS AND EXPORTS. Imports and exports are correlative terms; they denote the organic constituents of that which is known as commerce. Early opinion looked favourably on exports, regarding them as signs of successful trade.

In 1776 Adam Smith published his *Wealth of Nations;* in 1783 the first reference in parliament was made to that work; in the same year the younger Pitt became prime minister of England. This period may fairly be taken as the starting-point of the modern history of European trade. The closing years of the 18th century and opening years of the 19th saw almost universal war amongst civilised peoples; and the war was accompanied by extraordinary efforts to restrict and regulate the trade of the belligerents. It has been said that in the later years of the war Napoleon's chief object was to strike a fatal blow at English trade. The Berlin decree of 1807, and the counter-moves which it called forth, were evidence of the mischief he did to all (see CONTINENTAL SYSTEM). For thirty years, from 1785 to 1815, the trade of Europe was subjected to the double disturbance arising from constant war and from unreasoning interference of all descriptions. The next thirty years (1815-1845) represent a period of rest, and, as far at least as England was concerned, a period of transition. The remaining years of the century to our own time exhibit free-trade England dealing with a world mainly, almost universally, protectionist, and expanding her commerce to a degree of which the trade-reformers never dreamed.

A review of foreign legislation during this century shows that in varying degrees protection, sometimes contracting even to prohibition, has everywhere ruled abroad. Commercial treaties and the most favoured nation clause have been a palliative, but have not checked the inveterate evil. The establishment of the German ZOLLVEREIN in 1833 is a leading event in the period, but had little effect on external trade. The United States of America started the theory of absolute commercial independence as early as 1789; their consequent efforts at protection have not been uniform; they rose to their greatest height (before the recent Act) in the tariffs of 1824-28. In 1833 (the Clay tariff), and again in 1846 (the Walker tariff), opposite tendencies prevailed, but since 1860 there has been a gradual tightening of the cords.

The commercial history of Great Britain has been more interesting for this period than that of any other country. The closing years of the 18th century contained the germs of many changes. In 1784 England had parted definitely with her great colonies in the New World, and in 1788 she laid the foundations of Australia. About the same time Ireland was admitted to something like commercial equality; in 1801 came the union. In 1804 England obtained a lasting footing in South Africa. The East Indian empire was being gradually built up throughout the period; the Company's East Indian trade being thrown open in 1813, and its China monopoly coming to an end in 1833. Again in 1785 Arkwright's patent was thrown open, and the use of machinery began to spread in the woollen and cotton manufactures. But till past 1820 the national life was weighted with commercial restrictions. "Everything conceivable was taxed," says Rogers. Smuggling was rampant; the tariff and excise laws were "all but universally disregarded." In 1825 through HUSKISSON (*q.v.*) the first indications of a change came, and the theory of a close colonial trade was broken down. The repeal of the corn laws in 1846, and the freeing of the tariff in 1861, were the final scenes in the commercial emancipation.

The commercial history of the British colonies is more recent. Canada and most of the Australian colonies have tended more and more towards protection. In most of the other colonies the customs tariffs have been sufficiently heavy to operate as some check to trade, but they remain revenue tariffs nevertheless. The discovery of gold in Australia in 1851 gave a special impulse to the trade of those colonies (see COLONIES).

It would have been interesting to compare the gross value of the trade of the world at the end of last century with its value at the present time, but the apparent impossibility of obtaining satisfactory statistics of exports and imports, even of the leading European countries, at so early a date has prevented this attempt. For Great Britain fairly trustworthy figures exist, and the same is true of the United States, and we therefore give tables illustrating the development of the trade of these two leading commercial powers of the world. It is clear that any development of the trade of a single great commercial power is an index of a general development of some magnitude; as an increase of imports by that power postulates an increase of the exporting power of other parts of the world and *vice versa*. And in the case of Great Britain it can be shown that her trade has always been widely distributed, and that its growth represents a corresponding development of many countries.

At the beginning of the century, Pitt, in the House of Commons, in the course of his resolutions of the 28th July 1801, dealing with the public debt, stated the increase in the exports and imports of Great Britain as follows:

		Imports.	Exports.
Average of six years to	1784	£11,690,829	£8,616,660
"	1793	18,685,390	14,771,049
For the one year "	1799	29,945,808	24,084,000

The following table gives some idea of the growth of the foreign trade of the United Kingdom since Pitt's time.

Year.	Imports.	Exports.	Population.	Trade per Head.
	£	£		£ s. d.
1786	26,500,000	27,000,000	13,500,000	4 0 0
1800	53,250,000	52,000,000	15,000,000	7 0 0
1815	43,000,000	64,000,000	19,000,000	5 12 6
1830	58,000,000	45,000,000	24,000,000	4 6 0
1845	88,000,000	68,000,000	27,000,000	5 15 0
1860	210,580,873	164,521,851	28,900,000	13 0 0
1875	373,939,577	281,612,323	32,700,000	20 0 0
1890	420,691,997	328,252,118	37,800,000	19 16 3
1904	551,038,628	371,015,321	42,800,000	21 10 11

The figures of the earlier years, viz. from 1786 to 1845, are, so far as we know, the first attempt to give some idea of the actual value of exports and imports for those periods. The principles of the calculation are briefly indicated in the last paragraph of this article; it is enough to say here that the amounts have been calculated with great care and verified in different ways from the most authentic records. The trade between Ireland and Great Britain in 1786, 1800, and 1815 has been excluded, and the foreign trade of Ireland added; so that those years are on the same basis as the later ones. For figures which can only be approximate we purposely adopt round numbers.

The table justifies the following conclusions—

(1) In the first period, when invention was giving an impulse to industry, the exports and total foreign trade nearly doubled in amount and gave an increase of 75 per cent per head of population.

(2) The volume of foreign trade was practically stationary for the first thirty years of the century, but the amount of exports and imports fluctuated greatly as compared with each other.

(3) The turn for the better was coincident with free trade, and since 1845 the expansion of foreign trade has been continuous. The trade per head in 1860 was two and a quarter times as great as it was in 1845. It was more than half as large again in 1875. Since 1875, judging by the board of trade statistics, the average of the annual imports and exports per head of the population of the United Kingdom has, apart from an occasional drop, been fairly steady at £19 or £20.

(4) Imports have, as a rule, largely exceeded exports; the only year in which the exports materially exceeded imports being the year of Waterloo, and this fact agrees remarkably with the statement made by Macgregor that we paid our subsidies to the continent in that war in the goods of British origin for which, in spite of embargoes, there was such a demand on the continent. The theory of the excess of imports will be found fully treated in the article on COMMERCE.

That the trade of the United Kingdom has always been so diversified and widely ramified that its growth is a fair index of expansion in other parts of the world may be gathered from an inspection of the tables of trade with different foreign countries. For the trade of the present day there are the board of trade abstracts. But the same tale is told by an examination of old parliamentary returns. In 1786, for instance, the following countries participated as follows in English trade:

Germany—total trade with England		.	£1,763,952
Holland	,,	,, .	1,842,057
Russia	,,	,, .	1,717,604
United States	,,	,, .	2,443,574

and there was a large trade with our own possessions in Asia and the West Indies. A century later, in 1890, the total trade with the countries above mentioned, which we place here merely for comparison, was as follows:

Germany—total trade with England			£56,589,612
Holland	,,	,, .	45,245,007
Russia	,,	,, .	32,597,022
United States	,,	,, .	143,623,361

The comparison of such figures indicates the general growth of trade in the world.

The following figures exhibit the growth of the imports and exports of the United States.

Year.	Imports.	Exports.	Total per head of pop.
1840	$107,141,519	$132,086,000	$14·05

Mr. Farquhar (*Econom. and Industr. Delusions*) states that the total exports in 1806 and 1807 exceeded $100,000,000, and that this sum was not surpassed till 1834, and he shows that the amount per head of exported merchandise only, excluding specie, rose from $5½ in 1821 to more than $13½ in 1890, having been as high as $17½ *per caput*. This in spite of the unwise commercial policy which Mr. Farquhar seeks to expose. But steady as the progress of trade per head had been, it did little more than double itself between 1840 and 1880, whereas in that period, as we have seen above, British foreign trade was nearly quadrupled. At the present time the external trade of the States per head of population is not many more dollars than that of Great Britain is pounds sterling; and it seems to be declining.

As a further indication of the growth of trade in the world, we append a table showing the exports and imports of seven chief European countries up to 1890 during forty years; and we have added those of Mexico, Brazil, and Chili, as giving some indication of the development in Central and South America, to which so much European capital has of late years flowed. As far as possible bullion and specie

are omitted, but not for Holland, Spain, or the American States; it is impossible to obtain complete uniformity either of years or method; but the average results of the table are sufficiently correct to support general inferences.

The figures in the above table given under each year are usually the mean of two or more years around the year of the decade. It has been impossible, owing to imperfections in all the returns, to take the same years for each decade, or for all the countries in any one decade; but the variations are not material. The sterling amounts are mostly taken from board of trade returns.

It will be observed, that the volume of exports in all these countries increased at an even faster rate than those of England. Between 1850 and 1860 in this country exports rather more than doubled themselves, and between 1860 and 1890 they again did the same. But in the latter period those of Belgium and Spain were trebled, those of Holland rose to four and a half times their former amount; and the other countries selected except France increased their output as fast as our own country. Germany in the whole period increased its exports nine-fold. The growth of the imports is in much the same proportion. There has been no marked change in the figures of the above table during the last fifteen years, except the very large increase of trade which is found in the case of France and in a lesser degree Holland. The deductions remain broadly the same. So that without going into the rate of growth per head of population in each country, allowing for incorrectness of figures and divergence of method in returns, it may safely be inferred that everywhere increase of trade has been considerable. And this increase appears to have been hitherto largely independent of the trade policy of each particular country.

We shall now come back to Great Britain and examine the growth of its trade with its own colonies during a century past, and then compare its colonial trade with its foreign trade, as some considerable questions are centred in that comparison.

The following tables show the trade of Great Britain and Ireland with the rest of the empire at three periods. In the year 1815 the germs of the colonial empire of Great Britain as it now exists had been finally established. For 1855 careful returns are available in regard to the colonies; and the new trade policy of Great Britain was well settled. With these years we compare the figures of 1904, as representing the present extent of the trade.

The figures for 1815 in this return should be somewhat, but not a great deal, higher, as it has been impossible to ascertain and add to them the separate trade of Ireland in that

year with the British colonies; the total, however, would probably not exceed £17,000,000. Both imports and exports came near to doubling themselves between 1815 and 1855, while the imports nearly, and the exports more than, quadrupled themselves between 1855 and 1904. The increase of the total trade has been remarkable: in the case of the Australasian colonies it has sprung from £40,000 to a value of nearly £63,000,000; in the case of South Africa the exports of the United Kingdom have increased over ninety-fold, although the imports have increased in a much smaller ratio. The increased figures for South and West Africa are in part due to transfers—in the former case through the conquest of the Boer republics. One striking fact is not of course brought out by the table: within the last ten years the trade with several of the colonies, notably Canada, has doubled; with Natal it has almost trebled. Another point of interest is that in 1815 the West Indian trade is seen to be the greater part of the whole; it is now but one-fortieth of the aggregate, India taking the first place, with Australia closely following.

We may now turn to the trade of the United Kingdom in 1904 with various foreign countries.

Country.	Imports.	Exports.	Total Trade.
	£	£	£
United States	119,227,802	39,272,433	158,500,235

Total	431,020,222	250,231,825	681,252,047

The table has been so arranged as to show the order of magnitude of our total trade with the United States of America and the chief European countries; and one thing which is obvious on the face of the two last returns is that the foreign trade of England is far more valuable at the present time than the trade with the British empire.[1] It is well to lay stress on this fact at a moment when Great Britain is often exhorted to let one trade perish so long as she holds the other. The imports from the United States alone are equal to those from the whole of the colonies and India; though the latter are thrice as good customers for our exports as the States. In the European countries enumerated we find a market at least as valuable as that of our own possessions. The sum total of our foreign trade is not so very far from three times as great as that of our colonial trade. Yet if we compare the trade per head of population in each case, the comparison is immeasurably in favour of our own possessions. Against this in turn we must remember the heavy debts which our colonies have contracted on the London market. In any case the figures are a sufficient warning as to the inevitable derangement which would result from hasty tampering with the course of our trade.

[1] Originally written in 1892.

We proceed to give some idea of the total trade of the world, and the rate of exports per head in each country. The original table for 1890 sufficiently represents existing facts.

The materials at command do not admit of this table being perfect. There is a large balance of trade done in the world which is nowhere recorded. Many of the figures are rough averages. The conversion from foreign currencies into sterling admits new error. The varying methods in which returns are compiled is another difficulty. The case of transit trade is yet another, for the same goods may appear under two or three countries. Further, bullion and specie are omitted in most of the European returns, and as a rule are included in all others—but it has been impossible to reduce the returns to a fixed principle in this respect.

Yet with all these drawbacks it may be taken to show roughly that the exports of all the countries of the world amounted to £1,900,000,000 sterling in value in 1890; that 1,250 millions came from Europe, and only about a fourth of that amount, or 317 millions, from the whole of America; that the exports of Great Britain alone were equal to the whole of those of the American continent (comp. art. on COMMERCE).

Further, we observe that the imports generally exceed the exports; but in a large number of cases, particularly undeveloped countries, this result is not specially prominent. All those imports must be somewhere in the other column of the return as exports, but by the time they appear as imports their money-value has increased by the amount of freight and other charges.

In giving figures to show the comparative producing power of the different populations, we have confined ourselves to the rate per head of exports. The results of these figures are exceedingly interesting. Generally speaking, people in a backward state of civilisation give a low rate of production. Certain of the Australian colonies are at the head of the list, notably Queensland and South Australia, but Hawaii runs them close. Holland and Belgium stand very high, and the comparatively low position taken by Great Britain is remarkable. The United States have a very low rate per head. A little reflection shows that these figures cannot be taken by themselves as an index of a country's prosperity; one country may have an enormous internal trade, to which the exports are no index; another may have a large transit trade. The imports and exports of Malta, as given in the *Statesman's Year-Book*, are an instance of the latter case.

We have hitherto been concerned chiefly with the statistical side of our subject; we have used values as the most convenient form of indicating the wealth involved; comparative value of trade being some index also of comparative volume; although, when we have to do with specific deductions from these figures, there are many cases in which the quantities of commodities and their prices must be examined with care.

There is, however, quite another side of the subject, which is of no little importance, though it cannot here be dealt with at length. The economic lesson of tables of exports and imports—their teaching as to the life and occupation of the people—is one of the most important branches of the study, and one that is usually neglected. This must be shown by tables of the kinds of articles exported. We find in the case of Great Britain a complete change in the nature of its trade during the period under review in this article. Until some years later than 1750 England uniformly exported grain and rough woollen goods; with the closing years of the 18th century she was developing manufactures at home, and her mercantile marine was bringing in tea, sugar, spices, and other tropical produce from her colonies. This was the transition; to-day an examination of her trade-returns presents the picture of a country all but exclu-

sively dependent for her food supply on foreign nations; and exporting her manufactures to every part of the habitable globe. Carrying this economic examination of the returns to those of the colonies, we are struck by the capacity of the British empire to depend entirely on itself in case of need; distance, however, being the great difficulty in the way of a realisation of this imperial independence. No other country in the world, save Holland, stands in anything like the same position as to the imports of the necessaries of life; but the colonial empire of Holland, important as it is, is entirely different in character from that of the United Kingdom. If we turn to the table of the world's trade and treat it similarly, we shall be able to classify the countries of the world according to their production of the necessaries of life, of luxuries, of raw materials, of manufactured goods; and the classification will obviously form a basis for a further sociological examination of the condition of each people.

Another point which may be illustrated by figures of exports and imports is the effect of war on the interchange between nations. War may act in two ways: in checking production and in diverting the course of trade. A great falling off in exports and imports, or a sudden development of trade with a particular country, may equally be the result of a state of hostilities. The trade of the United Kingdom in 1815 and 1855, and the years around these points—the trade of the United States in 1860 and onwards—that of France in 1869-1872, all illustrate the principle.

It remains to consider briefly the value of the available figures representing the trade of various countries. In the length of time for which even approximately accurate figures can be obtained, Great Britain is far ahead of other countries. Probably the United States come next, although we have had great difficulty in tracing any figures at all in the early part of the century. It is a matter of serious doubt how far any set of figures represents what it professes to represent; thus the statement of the trade of the world above given is in the broadest sense provisional, for there are scarcely any countries which make their returns on the same basis. Even the British possessions vary from one another and from the correct system of calculation; they are not even always *bona-fide*. In 1883 a witness before an inter-departmental committee on the subject of the statistical returns of the British empire admitted that it was at one time a practice in the colony which he represented to cook the returns, so as to accord with the theory that exports should exceed imports. The divergence between official and real values in the figures of British trade prior to 1854 we have already mentioned (see also Declared and Real Values). The official figures up to that date were founded on valuations of products settled in 1694; these valuations probably held good well into the 18th century; but towards the close of it they had got very far out, and official reports began to recognise this. The inspector-general of imports and exports, after making his official return, would add a computation of the real values. For the adjustment of the imports we have to rely upon general inference from those computations, and upon the fact that in 1854, when the new system was introduced, the real value was found to exceed the official value by 22¾ per cent. In regard to the valuation of exports material for adjustment came in during 1798; from which date the declared value of British produce exported is found side by side with the official value; exceeding it by 68 per cent in the first year, and by a diminishing percentage until 1820, when the divergence went the other way, and official value rose from 5 per cent in excess to about 150 per cent at the date when the fictitious official value was finally discarded. It is obvious that any argument based on the official figures was misleading; and we have therefore in this article used all the material at command in adjusting the figures and checking the adjustment, until we obtained figures which, as nearly as it can ever be done, represented the course of the trade of Great Britain prior to 1854. It will, however, be many years before general correctness can be obtained and we can hope to have from every country exports calculated at their value at the port of shipment, and imports representing the value as exports *plus* the value of the freight, insurance, etc., while transit trade is carefully eliminated from importation for consumption. The variant practice as to bullion and specie also needs correction. The separation of these commodities from merchandise is usual in modern statistics and is adopted by the board of trade; it is due to some sort of recognition that they are often in the nature of a transit trade; but the analysis is very imperfect and probably as often wrong as right.

[There is no single work on the study of exports and imports which can be referred to. Sir R. Giffen's essay on the use of import and export statistics, published in the second series of his *Essays on Finance*, is quite the best summary of the theory of the matter.—In Marshall's *Statistics of the British Empire*, 1800-1833, there is a useful introduction to the tables of exports and imports, vitiated by the old fallacy as to official values.—*First Report of the Commissioners of Customs and Appendices* (1857).—The Board of Trade annual *Statistical Abstracts* of the trade of (1) the United Kingdom, and (2) the British possessions.—The similar abstracts of the trade of foreign countries from 1830 to 1860.—Various valuable returns laid before parliament.—The

Statesman's Year-Book and *Annuaire de la Statistique* summarise the returns published by foreign countries.—The *Consular Reports* published annually for Parliament give more detailed but partial information as to foreign countries.—Macpherson's *Annals of British Commerce, passim.*—Pitkin, *Statistics of the United States, New York*, 1817.—Porter's *Progress of the Nation*, 1847, § iii. ch. ix.—M'Culloch, *Account of the British Empire*, vol. ii. pt. iii. ch. v.—List, *System of National Economy* (translated, 1885).—S. IMPORT DUTIES.

History of Import Duties, p. 367; Incidence of, p. 369; Specific *v. ad valorem*, p. 369; Amount of Duty, p. 369.

History of Import Duties.—A reference to the article on EXPORTS, DUTIES ON, will show that duties on imports, though now so much the more important, were instituted later in time, at any rate in England, than export duties. At first the two were not thought of as distinct forms of taxation: both were merely an impost on the trader. The custom called Scavage, which we find, in the reign of Henry III., levied on all sorts of merchandise brought from beyond seas, was akin to an import duty, and the PRISAGE on wine was practically one taken in kind. But the first real import duties date from 1304, under the name of *parva custuma:* they were levied on foreign merchants only, and in addition to other existing duties, as follows:

Wine, per dolium 2s.
General merchandise, 3d. in the £1 *ad valorem.*

On 20th August 1309 these duties were suspended with a view to seeing whether consumers would gain in the price; but on 2nd August 1310 they were re-imposed, as "no advantage had ensued either to the king or people." The duty on wine came to be called *tunnage*, and the *ad valorem* duty *poundage* (see TUNNAGE AND POUNDAGE); and these under the name of SUBSIDY became a regular part of the financial system of England. In 1548 the duty on wine was 3s. (except for Rhenish), and the poundage 12d. in the £1, or 5 per cent.

The progenitor of the modern tariff rose in the shape of the BOOK of RATES at a comparatively early period. This book, issued at first by the sole authority of the crown, enumerated the values which were to be assigned to different articles for the purposes of calculating the *ad valorem* duty just referred to. "These values were probably in the earliest instances the current prices of the articles imported." One of these rate-books was "imprinted in 1545." The principle of assessment was laid down ten years later (1555) as "to underrate the most necessary commodities that came into the realm, to draw them hither, and to overrate the superfluous commodities inwards to drive them away." James I. was not satisfied with this principle, and declared that everything required to be rated higher. He levied a new imposition in addition to the subsidy, thereby complicating the form in which duties were received, and in many cases doubling the revenue which parliament had intended him to derive. This gave rise in 1642 to the issue of a rate-book by the Houses of Parliament only. The book issued in 1662 enumerated 1139 articles inwards, and 212 outwards (see ENUMERATED COMMODITIES).

In the ensuing century it became a growing practice to impose fresh import duties by special acts in special emergencies; and by 1784 no fewer than 100 new heads of account referable to different funds—*e.g.* aggregate fund, sinking fund, general fund, etc.—had been opened in the customs department, under any or all of which any given article might be liable to duty. An example of this "bewildering and appalling chaos" is given on p. 18 of the First Report of the Customs Commissioners. Merchants hardly knew what they had to pay without expert assistance; even officers at the outports were sorely puzzled. The whole system hindered trade, and lent itself to smuggling; so that, in spite of the mercantile theory, which enforced the view that protective import duties were an encouragement to the country's trade, it became felt that the existing system was intolerable. The first step in the direction of reform was made by Pitt's Customs Consolidation Act in 1787. This rated 1200 articles for duty inwards; of these 300 were rated *ad valorem.* It also provided that all import duties should henceforward be carried to one fund, now known as the Consolidated Fund.

But in the moment that the collection of the import duties was simplified, the idea which assigned to them an important function in enhancing a nation's wealth appears to have gained new strength. For forty years thereafter the followers of ADAM SMITH made no impression on the idea. HUSKISSON, as chancellor of the exchequer in 1825, was the first statesman who showed the possibility of dispensing with a multiplicity of import duties. Sir Robert PEEL, in the tariff of 1841, made the next move; and with the triumph of the free-trade policy the numbers of articles subjected to duty rapidly diminished, as the following table will show:

Year.	Principal articles.	Subdivisions.	Total number.
1660	490	1140	1630
1787	290	1135	1425
1826	432	848	1280
1841	564	488	1052
1849	233	282	515
1855	153	261	414
1861	19	123	142
1876	10	32	42

At the same time the customs revenue showed no signs of decrease.

In 1855 it amounted to			£22,227,570
,, 1860	,,	,,	24,391,084
,, 1865	,,	,,	22,527,373
,, 1870	,,	,,	21,449,843

As a matter of fact there was a considerable expansion due to causes amongst which the progressive simplifications of the tariff had a considerable place. It is calculated that the customs duties remitted between 1855 and 1870 amounted to £14,872,331, and those imposed to £612,915, showing an estimated loss of revenue of £14,259,416, which never took place, as the figures above quoted have shown.

In 1860 there were duties levied on the importation of nineteen articles, in 1890 on ten only, excluding certain minor divisions under "spirits." The subjoined table shows those which had dropped out, and compares the produce for the two dates.

	1860	1890
Sugar, etc., producing	£6,100,288	abolished
Tea	5,444,157	£4,490,506
Coffee	445,999	172,832
Corn, etc.	751,046	abolished
Butter	23,881	do.
Currants	233,897	534,831
Raisins	103,196	
Wood	294,134	abolished
Tobacco, etc.	5,674,053	9,061,984
Wine	1,174,103	1,302,160
Spirits	2,413,919	4,681,225
Silk manufactures	16,576	abolished
Other articles	490,515	183,157

Since 1890 there have been two important changes in the tariff. In 1901 the sugar duty was reimposed, and in 1902 a duty on corn was imposed for one year as a temporary measure. The tariff of the United Kingdom, then, subjects the minimum number of commodities to taxation.

In the import duties of various British colonies we find considerable divergences, illustrating different phases of history. Those of the older colonies, especially the West Indies, have always borne the stamp of the old cumbrous régime; those of the Australian colonies began with a levy of *ad valorem* duties on a few imported articles; but developed, as in Canada, into an engine for protection. The hand of Canadian legislators has been forced by the proximity of the United States; after an effort in 1867 to work with moderate import duties, the colonial manufacturers overbore the liberal opposition; and the "national" policy of Sir J. Macdonald has, since 1879, been driving the Dominion into stricter forms of protection, chiefly directed against the United States. The tariff of Canada now fills twenty-seven closely-printed columns of a parliamentary return, and makes a respectable pamphlet by itself. Even Victoria's covers eleven only. The spirit of the new protection has caught all the Australian colonies except New South Wales. Their high duties are directed alike against the mother country and the foreigners. The Cape has been slowly tending to imitate Australia. The Eastern and West Indian colonies, with some exceptions, have tariffs which are in form a survival of the old mercantile system, but their duties are levied simply for revenue purposes, and their rates are rarely excessive. As most of these colonies are under the more immediate control of the crown, there has been a considerable effort made to simplify their tariffs, and remove the duties on food-stuffs and necessaries, but the success has been small; local opinion, particularly in the West Indies, argues that imported food-stuffs are to the negro or coolie a luxury, and that by giving up the duty on such articles, an easily-collected revenue would be lost without one whit improving the condition of the labourer (*cf.* COLONIES; COLONIAL POLICY).

India, following the lead of the imperial government, keeps to a small and purely revenue tariff of import duties.

The history of import duties in the European continental countries records a passage from restriction to moderate duties and a reaction to rigid protection. For the import duty is the engine of protection. France, down to 1860, had always adopted a system of jealous exclusion. Macgregor, in 1841, calls the commercial legislation of Spain "the most pernicious and restrictive of all the systems of trading exclusion." The same condemnation was accorded to the other European tariffs except, perhaps, that of the German customs union, which had conferred incalculable benefit on the states included in it by breaking down the barriers of import duties between them, and assigning more moderate duties on the importation of foreign goods. The adoption of free trade by England induced Holland and other countries to modify their import tariffs. The treaty of 1860 with France marked a new era; restriction gave way to duties which, though still protective, were comparatively low. A great increase both in imports and exports was the immediate result. Other nations followed this example, and for some years the import duties of European countries were in practice regulated by treaties in the general interest. Then came the protectionist reaction, which Prof. Bastable dates from the Franco-German war of 1870; war expenditure and national jealousy gave a bias towards a system of heavier duties as between the two rivals; other nations followed with an idea of protecting themselves.

The United States have passed through various stages of doubt; from 1824 to 1875 their import duties were alternately raised and lowered for two or three years at a time; here again the great rise took place in the war period from 1861-65, and subsequent efforts at reduction made no great impression. Since 1883 the tariff has been severely protective, ultimately culminating in the cumbrous McKinley tariff of 1890, which laid crushing duties on all foreign manufactures, though it freed certain commodities which were thought to be required for the home producer.

The South American states, influenced partly by the United States, and partly by European example, levy onerous duties.

To sum up: England stands practically alone in the world as a country with a simple and low tariff; in British colonies the tariffs are usually cumbrous, but fall into two classes, —the one where many import duties are merely the easiest way of getting revenue, the other where those duties are avowedly protective. Of foreign countries it may be said that, at the present day, all except Holland and Belgium which at a considerable interval followed England, have deserted the revenue and adopted the protective tariff.

Incidence of Import Duties.—The popularity of import duties as a source of revenue is usually and probably correctly ascribed to the fact that they are collected without application to any large number of the taxpayers. The question of their incidence has in England been settled for years; the accepted view being that all duties paid by the merchant on importation are added by him to the price of the commodity, and are thus eventually paid by the consumer. It is probable that in early days there was an idea that the foreign merchant paid the tax. But it soon came to be understood that they were at least usually paid by the consumer and not by the merchants; the order of 1309 (see page 367) seems to be clear evidence of this. The proposition that they are actually paid by the merchant himself has been advanced in recent controversies with some of the British colonies, more particularly those in the West Indies, where it is commonly held that an increase of 5 per cent in an *ad valorem* duty cannot be put on the price, but must be borne by the merchant, and, on the other hand, that a remission of duty benefits the merchant only, as price is not affected. This view, however, is difficult to support, and has been contradicted by its advocates in the course of their own arguments. An opposite view was held in the case of these very colonies in 1842 by both the parties to the controversy whether higher import duties were the best means of increasing the inducement to the negro to work (Earl Grey's *Colonial Policy*, vol. i. p. 80 *et seq.*). Again, it has been advanced, chiefly in the United States, that protective import duties are paid by the foreigner; but this cannot, properly speaking, be true for long, even when the foreigner's market is restricted to the nation which imposes the duty. The foreign producer, if the consumer declines to pay a higher price, may consent to forego for a time a part of his ordinary profits, and in this sense he may "pay the duty"; but eventually he will cease producing; if he is willing to accept a permanently lower rate of profit, this can hardly, in economics, be spoken of as paying the duty. As an illustration we may cite the case of the Bermuda onion-growers, who sent a deputation to New York in 1893, with a view of obtaining concessions in the matter of the import duty on onions. As interesting examples of the operation of certain import duties, we may refer to the old duties on sugar (*v.* M'Culloch, *Taxation*, p. 210), and those on corn (*v.* Leone Levi, *On Taxation*, pp. 77-79).

Specific v. *Ad valorem Duties.*—The question of specific or rated as against *ad valorem* duties is one that has been vigorously debated, and cannot be considered settled; there are still high practical authorities who state that it costs no greater trouble to collect the latter than the former. The better opinion is, however, that *ad valorem* rates are constantly unfair, and give rise to unnecessary friction between the customs staff and the merchants; Mr. Gladstone, in his budget speech of 1853, adopted this opinion; the customs commissioners in 1857 stated that the labour of their officers had been greatly reduced in consequence of the diminution in the number of *ad valorem* duties. This is equivalent to economy in the cost of collection. The legislation of Great Britain has been based on this opinion; in 1797 there were 300 *ad valorem* duties, in 1842 there were 156, in 1855 they had been reduced to 40: they have now disappeared. In the colonies they remain in full force, though the home government, where it has influence, is gradually obtaining a change to specific rates.

A plan of combining a specific with an *ad valorem* duty on the same commodity has been adopted in the United States, and has spread to Canada. It hampers trade and adds to the labour of collection. Nearly akin to it was the old plan, adopted in England in 1840 and rejected in 1853, of adding a general percentage to all duties. This was till lately a favourite mode of raising additional taxation in many of the British colonies.

Amount of Duty.—It is a question of some nicety whether import duties should be adjusted so as to represent as far as possible a uniform percentage on the value of the commodity. Mr. Gladstone apparently adopted the theory in 1853, and placed the percentage at 10 per cent. But the nature and use of a commodity, and the extent of the demand for

it, may render a much higher percentage an equally fair tax. The highest *ad valorem* rate in any British colony upon general merchandise is 25 per cent; it is usually far lower. Protective tariffs load imports with duties which are usually at least 30 per cent, and the general basis of the McKinley tariff was 50 per cent for all manufactures.

This article would not be complete without reference to drawbacks and the methods of facilitating the collection of duties. DRAWBACKS (*q.v.*) were the original method of relieving a merchant of the payment of part of the import duty when he desired to re-export a duty-paid article. The statute 12 Car. II. c. 4, first admitted this, reimbursing the whole duty in some cases, half in others. In 1788 a fourth of the gross revenue of the customs was returned by way of drawbacks. This system was first modified by permitting the importation of articles merely on a bond for the payment of the duty; this gave rise to constant fraud, and was the source of much risk and additional labour to the government. The warehousing system, or deposit of commodities in BONDED WAREHOUSES (*q.v.*) until such time as the duty is paid, has almost entirely done away with drawbacks. They still, however, form a common item of account in colonial budgets.

A. H.

IMPORTS AND EXPORTS, FREEDOM AND RESTRAINT OF. We shall deal with Imports and Exports separately.

Free Imports.—This subject may be considered under two divisions.

(*a*) *General freedom of importation.* This matter may best be studied from the point of view of its converse (see below, IMPORTS, RESTRAINT ON): it is on the whole easier to show the results of moving contrary to natural laws, than to exhibit the working of a natural system. And though the general history of commerce seems to be the history of restriction, yet the natural impulse of commercial man is to exchange his products with others free from let and hindrance.

The leading commercial nations of the middle ages admitted imports free of duty, or at a low duty: and the leading commercial nation of the present day—Great Britain—admits almost all commodities free of duty. The Hanseatic towns, in an age of general exclusion, levied duties ranging from one-half to three-quarters per cent: and Holland for some two centuries, and all through the time of its greatness, kept its ports practically free to the importation of all sorts of merchandise from all parts of the world. It is somewhat surprising to find that the Turkish empire was the only other European power, till modern times, which kept its ports free for all imports, but the Turkish government spoiled their policy by prohibiting exports! Early in this century, and before England was converted to free trade, the Argentine republic endeavoured to remove all restrictions on importation; but it has now fallen under the influence of American example.

At the present time Great Britain and some of her dependencies, notably India, Hong-Kong, and the Straits Settlements, with Holland and Belgium, are the only examples of an importation generally free.

(*b*) *Free importation of special articles.* This is nowadays a usual feature even in countries which are strictly protectionist; it is usual to admit free of duty various articles which are expected to be of special advantage to the importing nation. These are included in a "free list" (see FREE LIST). C. A. H.

Free Exports.—As nearly all nations now encourage exportation, not only by refraining from the levy of duties but even by granting bounties, the expediency of leaving export trade generally free may be assumed. The articles on EXPORTS, DUTIES ON, and FREE TRADE will give some idea of the progress of the modern principle, and the cases in which it is still interfered with by duties. It will best be understood by considering the cases of its infraction.

Restraint on Exports.—The idea of prohibiting exports of certain commodities appears to have influenced communities earlier than the attempt to restrain imports. It is based on the idea of preventing—to quote the French statement of it—"all that may contribute to the development of foreign industry."

In the case of England it was first applied in 1261 to the export of wool—the subject of her great original industry. By 8 Eliz. c. 3, and later enactments, severe penalties were imposed on those who exported sheep and wool. But these severe laws failed to attain their end. By 13 & 14 Car. II. 7, hides and leather, by still older statutes, metals, as late as 7 & 8 Will. III. c. 20, instruments of industry, were made the subjects of prohibition. This has all now been reversed for fifty years.

Similar prohibitions, or discouragement of exportation by high duties, were common to most European countries. The French at the end of last century, in the words quoted above, laid down the principle publicly. The Spaniards prohibited the exports of corn up to 1820: Turkey prohibited all exportation till well on into this century. Greece, on her independence, was more moderate, simply imposing a duty of 6 per cent *ad valorem* on all exports. Sicily, in 1839, had recourse to a monopoly to limit the export of sulphur to a fixed annual amount.

The prohibition of the exportation of precious metals rested on a different shade of the idea,

and formed part of the MERCANTILE SYSTEM (*q.v.*), by which they were considered the sole source of wealth to be retained in the country at all hazards.

Prohibition on exportation to an enemy had a somewhat different basis, and still is recognised as perfectly legitimate in the case of munitions of war (see CONTRABAND).

[An excellent summary of the English history will be found in Adam Smith's *Wealth of Nations*, bk. iv. ch. viii.—Art. on BUDGET.—See also Macgregor's *Commercial and Financial Legislation of Europe*, and the works cited under EXPORTS, DUTIES ON.] C. A. H.

IMPORTS, RESTRAINT ON. This is a subject necessarily interwoven with the history of import duties and the theory of trade. The restriction of importation of foreign goods has, in the history of commerce, taken two forms—(1) absolute prohibition, (2) the imposition of heavy duties. It appears to have had its origin in the desire of keeping all production in the hands of the home-producer; and so far it is the ancestor of protection which Mill defines as "the prohibition, or the discouragement by heavy duties, of such foreign commodities as are capable of being produced at home": it was used later as a punishment to the foreigner. Its correlative is smuggling: when restriction is at its height, smuggling is rife.

It appears to be true that in modern history England was the first prominent example of a restrictive policy: this policy was carried out rather by the NAVIGATION LAWS (*q.v.*) and by complexity of customs laws than by direct prohibition or through the medium of heavy import duties; but as late as 1841 Macgregor (*Commercial and Financial Legislation of Europe and America*) could state that English legislation practically prohibited the importation of corn and of foreign sugars and coffee, and up to a recent date this was true of malt.

It was in France, however, that the use of direct prohibition and of the prohibitive duty was first developed. In 1664 Colbert introduced the principle of excluding foreign manufactures by raising the duties on them: the first absolute prohibitions of foreign commodities—woven clothes from India and the East—became law in 1686. The celebrated commercial treaty of 1786 gave a comparatively easy entrance to English manufactures; but the subsequent wars introduced a complete reversal of this more liberal policy. The episode of the prohibitions based on the Berlin and Milan decrees belongs rather to the story of the war than to ordinary commercial history; but it illustrated singularly well the futility of restrictions on trade: *viz.* the automatic tendency to defeat their own end. In spite of Napoleon's efforts to exclude English manufactures and thus ruin English commerce, these manufactures not only found their way into continental markets, but were brought into France with the connivance of the French ministers: "M. de Talleyrand . . . secretly countenanced the landing of British goods solely for the benefit of France" (Macgregor, work cited, p. 38 note). Prohibition remained a leading feature of the French tariff till the treaty of 1860 with England; and of late years French legislation has been retrograding in the old direction by imposing heavy protective duties (see IMPORT DUTIES).

In Spain a definite restrictive policy began almost contemporaneously with that of France, and has hardly ever seen any relaxation. The Spanish tariff, besides hampering trade by its complexity, loaded all foreign imports with duties varying from 50 to 100 per cent of value; and in the middle of the century it contained at least 500 total prohibitions. Holland, after an era of freedom, adopted a few fairly heavy duties in the course of this century, and some actual prohibitions, which were partly political. And, generally, all European nations have been wedded to systems of restraint more or less complete.

The leading modern example of a restrictive policy is the McKinley tariff, which became the law of the United States in 1891; it was avowedly a stringent protective tariff, aimed at making the States self-supporting and crushing out foreign competition; its duties amounted in many cases to 50 per cent of the value of the commodity on arrival, and this was sufficient in some articles to cause a complete transfer of the capital engaged in their production from England to the United States.

The evil effects of a restrictive system are (*a*) its expense to the consumer. Restriction could only be necessary to force a trade out of its natural channel, and that is always expensive. Other bad results appear to be felt more slowly than formerly, for (*b*) smuggling is more easily checked owing to facility of communication; (*c*) adulteration and counterfeiting are more difficult because of the general prevalence of minute inspection.

In particular cases evils more far-reaching have been traced, and are doubtless still traceable to restriction. Macgregor in 1841 attributed the heavy drudgery of the peasantry and especially the women in France, and the backwardness of cultivation, to dearness of iron consequent on prohibitions of foreign goods. The prohibition of corn has produced evils more patent still. A good illustration of this point occurred a few years back, when the government of Venezuela was forced to suspend its heavy import duties on food-stuffs owing to complete failure of the home crops.

The accepted opinion of economists is that all restraint on commerce is injurious: the whole theory of free trade is built up on that idea. It would hardly be necessary to refer to this, were it not that List and others have argued that

restriction at an early period of a nation's history is the source of ultimate wealth; and the commercial greatness of England has by some been traced to the self-sufficiency produced by past restrictions on foreign trade—that is, to protection in past ages. These reasoners have neglected the fact of England's geographical position and conformation, her comparatively early political freedom, the early invention of machinery, and other factors.

As regards new countries, however, the system has been in some measure justified by the high authority of Mill (bk. v. ch. x. § 1) (see PROTECTION).

There are certain cases in which the importation of special articles is prohibited or restricted on grounds of public safety or morality: obscene books and prints or dangerous explosives are instances which are common to most modern tariffs. The case of foreign reprints of copyright works—which are prohibited from importation into Great Britain and Ireland and also into the colonies unless certain special arrangements have been made for the benefit of the authors (see 5 & 6 Vict. c. 45, § 17; 25 & 26 Vict. c. 68, § 10), rests on conventional and quasi-moral grounds.

[Ad. Smith, *W. of N.*, bk. iv. ch. ii. and iii.—For facts see John Macgregor's *Commercial and Financial Legislation of Europe and America*, London, 1841.—See also, for America, Edward Atkinson's *Taxation and Work*, New York, 1892.]

C. A. H.

IMPÔT UNIQUE (or SINGLE TAX). The limited and restricted sense in which this term was used by the physiocratic school is best explained by the following quotations from the writings of Quesnay and his followers. "Taxation ought not to be destructive of nor out of proportion to the total income of the nation; . . . it must be levied directly on the net return (*produit net*) of land and not on wages, or on the [gross] produce, in which case it would increase the cost of production, be detrimental to trade, and destroy annually a part of the wealth of the nation" (Quesnay, p. 83, ed. Daire, Paris, 1846, p. 332, ed. Oncken). "Men are not at liberty to assess taxation according to their will; it has an *essential* basis and form settled by the order of nature. . . . Only the portion of crops called the *net product* (meaning after deduction of the outlay made by the agriculturist) should contribute to taxation. . . . Taxation is thus *essentially* a portion of the *net product* of land" (Dupont de Nemours, *Physiocrates*, p. 351, ed. Daire). This system Dupont, in his letters to J. B. Say (p. 405 same ed.), calls a *domanial constitution of finance based on the sharing of returns*. "What is only a portion of a net product can only be taken on a net product; . . . hence the essential form of the tax consists in taking taxation *directly* where it is present" (Mercier de la Rivière, *Ordre Naturel des Sociétés Politiques*, p. 474, ed. Daire). The Abbé Baudeau considers that a share of six twentieths of the *net product* may be allotted to the representatives of the sovereign (*Introduction à la Philosophie Économique*, p. 760, ed. Daire).

Viewed historically, the idea of the single tax is the result of a reaction against the crushing weight of a vexatious and omnipresent system of taxation. In France, as far back as 1576-1577, the states-general of Blois were asked to consider a motion of one of the members of the *Tiers État* to do away with all the existing taxes, and to establish instead an *impôt unique* described as the "*taille égalée*" (equalised tallage), assessed according to the means of the owner of each dwelling; it was in fact a kind of proportional hearth-money, from which, however, the nobility and clergy were to be exempted. This proposition was rejected, probably out of mistrust of the court (Clamagéran, *Histoire de l'Impôt*, ii. pp. 217-219). The system recommended by Vauban in his *Dîme Royale* (republished in Daire's *Économistes Financiers du XVIII^e Siècle*, and *Petite Bibliothèque Économique*) is well known, but was rejected by Mirabeau as "absolutely defective because this excellent man, having disregarded the principle that all wealth and income can only be derived from land, makes a muddle of his scheme by introducing an infinite number of double appropriations" (Knies, *Carl Friedrich von Baden's Brieflicher Verkehr mit Mirabeau*, i. p. 37, Heidelberg, 1892). In Italy, BANDINI (*q.v.*) entertained the same notions in his *Discorso Economico* presented in 1739 to the grand duke of Tuscany.

But owing to the unsoundness and iniquity of its financial system, Spain is the country where the single tax theory took the earliest and kept the most persistent hold both of the official and the speculative mind. Eager to defend the founder of its Austrian dynasty against the aspersions of Spanish writers, Mr. Konrad Haebler, in his *Wirtschaftliche Blüte Spaniens im 16. Jahrhundert* (p. 12), ascribes to Charles V. the first idea of a system of taxation based on the establishment of a single and direct tax. During the decay of the Spanish monarchy under the emperor's successors this idea was resumed under different forms: in 1573-75 and 1592-98, the cortes of Madrid proposed a single tax on grist levied when it left the mills, and this system was advocated at different times either by official bodies or private writers down to the middle of the last century. In 1646, Alcázar de Arriaga, in his *Nueva Declaracion de un medio universal para extinguir los tributos en Castilla* (New Declaration of a Universal Plan for Suppression of Taxes), advocated what he denominated the single ALCAVALA, a kind of general income tax of 2 per cent. In 1651 father Bautista DÁVILA proposed a single general and progressive capitation or poll-tax. Centani, however, is more than any one else entitled to be considered as a direct ancestor of the

French physiocrats. In a memorial entitled *Tierras* (Land), and submitted in 1671 to the king of Spain, Centani, taking up an opinion expressed a few years before by Juan de Castro, explicitly asserts that land is the only real wealth (*la tierra es la verdadera y fisica hacienda*), and insists on the removal of all indirect taxation in favour of a direct and territorial taxation founded on an exact and extensive CADASTRAL SURVEY. About half a century later, the minister ENSENADA gave orders to proceed with this survey in Castile on a plan which had been successfully carried out in Catalonia; and in 1770, Charles III. decreed the "*única contribucion*," which was, however, never actually put into force (Colmeiro, *Hist. de la Ec. Polit. en España*, ii. pp. 570-576).

In Baden, the margrave Carl Friedrich, prompted by purely theoretical views, decreed a similar experiment in three villages—Dallingen (district of Pforzheim), Bahlingen, and Theningen (district of Hochberg). Established in the years 1770 and 1771, it by degrees excited the discontent of the population, was gradually abandoned, and came to an end about the beginning of the present century. A good and clear account of this experiment is given in Conrad's *Jahrbücher für Nationaloekonomie u. Statistik*, 1872, vol. xix. (article by Emminghaus, *C. F. von Baden's Physiocratische Verbindungen*. See also Rodolphe Reuss, *Ch. de Butré*, Strasbourg, 1890).

In France, although the physiocratic doctrines always remained confined to theory, their influence may be traced in the steady aversion to indirect taxation of the representative assemblies at the time of the revolution of 1789. But after the space of a very few years, this aversion had to be overcome, for whatever may be its theoretical merits, no system of single taxation could possibly satisfy the ravenous appetites of our modern budgets.

[In addition to the works mentioned before, see Mirabeau's *Théorie de l'Impôt* (1761), various writings by Turgot collected by Daire in his edition under the heading of *Impôt* (vol. i. pp. 392-434), and Turgot's *Réflexions sur la Formation et la Distribution des Richesses*, in the first volume of *Mélanges* (ed. Daire).—Condillac, *Le Commerce et le Gouvernement* (pp. 355-359), also Cantillon, *Essai sur la nature du Commerce*, 1755 (pp. 55-61, Harvard reprint, 1892).—Saint Péravy, *Mémoire sur les Effets de l'Impôt Indirect* (1768), etc.

Among the opponents of the tax are Voltaire, *L'homme aux Quarante Écus*.—Forbonnais, *Principes Économiques* in Daire's *Mélanges* (p. 235 note, and p. 210, notes 1 and 2).—Mably, *Doutes proposées aux Économistes sur l'Ordre Naturel des Sociétés Politiques* (Paris, 1768, pp. 40-44).—GRASLIN (*q.v.*), *Essai Analytique sur la Richesse et sur l'Impôt* (London, 1767).—Rivière, *L'Ami de la Paix ou Réponse à la Théorie de l'Impôt du Marquis de Mirabeau* (1761).—Champalin, *Taxe-Personnelle et Unique* (1789).—Guiraudet, *Erreur des Économistes sur l'Impôt* (1790).

(See ÉPHÉMÉRIDES; PHYSIOCRATS; SINGLE TAX.)

IMPOUND. An expression originally used in respect of distrained cattle only, which were placed into a "pound" by way of security. It is now used generally with respect to any objects which, with some ulterior purpose, are put into a place of security. Thus a judge may order documents to be impounded if he thinks they may furnish material for a criminal prosecution. As to the way in which such documents are to be dealt with, see Rules of the Supreme Court, Order 42, Rule 33A. E. S.

IMPRESSMENT. From the earliest times every free and able-bodied Englishman has been liable to military service, but only for purposes of defence. The service of the primitive FYRD, and of the later militia, was restricted to putting down rebellion and repelling invasion. The sovereign could not lawfully claim the service of the subject for the purpose of manning the fleet, or of forming armies to serve abroad. But voluntary enlistment did not always furnish men enough for these purposes. The Tudors and Stuarts, therefore, had recourse to impressment. Impressment may be defined as an irregular and arbitrary compulsion to serve. It differs from the modern CONSCRIPTION, which is also compulsory, but imposes uniform and definite liabilities either on the whole population or on large classes of the community. In England, sailors were liable to be pressed for naval service (see Alexander JUSTICE), and men of the lower classes generally were liable to be pressed for military service. The impressment of sailors for the navy fell upon so limited a class, and was so convenient as a means of securing the national safety, that in spite of the gross abuses which it involved, it was maintained down to the close of our great naval wars, and never elicited a serious protest either from the courts of law or from parliament. It was otherwise with impressment for military service. The hardships which it involved affected a much greater number of persons, and the military strength which it lent to the crown provoked the jealousy of the friends of constitutional freedom. The impressment of soldiers by Charles I. in the course of his conflict with the Scotch people led to the statutory declaration made in 16 Car. I. c. 28, that no subject ought to be impressed, or compelled, to go out of his country to serve as a soldier except in case of the sudden coming of strange enemies into the kingdom. But parliament regarded impressment as necessary upon occasion, for by this very act it sanctioned the pressing of soldiers to serve in the Irish war. Several acts of parliament in the course

of the last century sanctioned the pressing of vagrants, and of idle or disorderly persons. Since 1780 impressment of soldiers has been virtually unknown. Impressment of sailors became unnecessary after the close of the French wars, but has never been declared unlawful. Should voluntary enlistment hereafter fail to supply the needs of the army and navy, recourse will probably be had to some scheme of conscription. The old impressment was inequitable in principle and brutal in execution. Much may be said for the policy of recruiting the army from the least valuable class of citizens. But the pressing of vagrants and disorderly persons would be a feeble resource now that the size of armies has been so much increased.

[See Clode, *Military Forces of the Crown.*—Anson, *Law and Custom of the Constitution.*—Captain Marryat, R.N., *Suggestions for the abolition of the present System of Impressment in the Naval Service*, 1822.—*Edinburgh Review*, Nov. 1814.] F. C. M.

IMPREST in public accounts denotes an advance to a sub-accountant or individual, usually from an authorised vote, to be accounted for in detail after expenditure. C. A. H.

IMPRISONMENT FOR DEBT. See DEBT, IMPRISONMENT FOR.

INCOME may be defined as the wealth, measured in money, which is at the disposal of an individual, or a community, per year or other unit of time. This term is not easily freed from ambiguity. Does wealth imply materiality; as Mill decides in a passage (*Pol. Econ.*, bk. i. ch. iii. § 2) which has been severely criticised by Mr. Cannan with reference to that kind of wealth which constitutes income (*Production and Distribution*, p. 31). The attribute in question may seem to be the only logical ground for a distinction which has been drawn by high authorities: by DUDLEY BAXTER (*National Income*, ch. viii.) between "original earnings," namely, "the productive income from agriculture and manufacture," and the "second-hand income" "paid out of original earnings"; and by Leone LEVI (*Report of the British Association*, 1881, p. 274), between "income derived from independent sources of production" and an opposite kind including "professional incomes which really constitute the expenditure of other classes." Can "original" and "independent" here mean anything but *material?* Probably it is best not to take this distinction, and to understand the "aggregate of commodities material and immaterial, including services of all kinds," (Marshall) which have the character of wealth.

Among such objects a distinction is drawn between those which commonly fetch a price and those which, though exchangeable, are not commonly exchanged. If a mother hire another woman to watch her baby while she herself works at a factory, the amount of paid services is greater than it would be if the mother attended to her home and the other woman worked in the factory. But the "aggregate of commodities" may well be less. So "no account is commonly taken of the benefit he [a man] derives from the use of his furniture" (Marshall). The distinction between *possibly exchangeable* and *actually exchanged* must be attended to when we compare incomes in widely different states of society in one of which many gifts of nature are free, in another, appropriated. The difference between the "luxuries, conveniences, and necessities" enjoyed by the English labourer, now and in the age of the Tudors, cannot be calculated from the difference in the respective money-incomes.

Next, what is meant by "at disposal," or the term which some would prefer, "net"? It excludes that portion of incomings which is required to keep up capital, and other outgoings. Are we then to exclude from the income of the labourer the expenditure which is necessary for his efficiency? This view is taken in a masterly report on the *Common measure of value in direct taxation*, by a committee of the British Association, which included Farr and Jevons and Newmarch (*Report of the British Association* for 1878). They say: "As the horse has to be clothed and stabled, so the productive labourer has to be clothed and housed." But there is this difference, that the cart-horse's food and gear are not "goods of the first order," objects of human consumption.

Again, among outgoings, should we place that portion of earnings which forms compensation for *désagréments?* If the trade of a butcher "is in most places more profitable than the greater part of common trades" only because it is "an odious business" (Adam Smith), should we say that the real net income of the butcher is the same as that of his neighbour in a common trade?

The preceding ambiguities are common to individual and social income (which is the sum of the incomes of individuals); the following is peculiar to social income: "Is the richness of a nation to be measured by the aggregate money-income of its inhabitants, or by their average income"? Prof. Marshall, who asks this question, suggests that "a rough notion of the economic strength of a nation . . . may be got by multiplying the aggregate income of its inhabitants by their average income."

It is fortunate that some of these difficulties disappear when the object is only to compare the incomes of different nations, or of the same nation, at different epochs. If the compared incomes are calculated on a uniform though imperfect plan, the ratios between the results are apt to be trustworthy (cp. Nicholson's *Principles of Political Economy*, p. 216); provided that account is taken of differences in the value of money. An example of the latter

correction is afforded by Sir R. Giffen's estimates of the growth of capital, which are based upon the growth of income.

[The most philosophical treatment of the subject known to the writer is to be found in Prof. Marshall's *Principles* in the chapter on "Income" (bk. ii.), and the sections relating to "National Dividend" (see Index). See also preface to 3rd edition. The statistics in the other works which have been referred to also deserve attention.] F. Y. E.

INCOME TAX IN THE UNITED KINGDOM.

History, p. 375; Scope of the Tax, p. 375; Basis of Charge, p. 376; Exemptions, p. 376; Inequalities, p. 377; Differentiation, p. 377; Graduation, p. 377; Incidence, p. 378; Rate and Yield, p. 378.

History.—It is only within the last century that a general income tax, imposed alike on profits derived from property, from trade and commerce, and from personal exertions, has become a normal method of levying taxation. In England a graduated tax, sometimes called an income tax, was levied in 1435 and again in 1450, but these taxes, as Thorold Rogers points out, fell short of the scope of a general income-tax, being levied only on those who possessed fixed sources of personal revenues (*Economic Interpretation of History*, p. 130; see also Dowell's *History of Taxation*, vol. i. pp. 112 and 116). In the reign of Henry VIII. taxes levied on earnings were imposed, but unsuccessfully, and from this time until the close of the 18th century no further attempt seems to have been made to levy a general income-tax.

Even under the great strain on our finances caused by the French war, it was with reluctance that W. Pitt made, in 1798, the great experiment of imposing a general income-tax, and he only did so after the failure of his attempt to arrive indirectly at the taxation of income by means of his celebrated plan of the Triple Assessment (*q.v.*). The income-tax imposed by Pitt was repealed on the conclusion of the Treaty of Amiens; but the tax was reimposed within a year by Addington, and remained in force until the end of the war. In 1842 Sir Robert Peel revived the tax to enable him to introduce fiscal reforms, and to improve the commerce and manufactures of the kingdom. It was intended that the revival should only be temporary, but the tax had now ceased to be a war-tax, and since 1842 it has maintained its place as one of the recognised means of meeting ordinary expenditure. In 1853 the area of the tax, which had previously been confined to Great Britain, was extended to include Ireland.

On one occasion only since 1842 has a serious proposal been made for the immediate repeal of the tax. On the dissolution of parliament in 1874, the prime minister (Mr. Gladstone) in a manifesto to his constituents announced his view that the circumstances of the time rendered it practicable to confer on the country the advantage and relief of the total repeal of the tax, which it had been the "happy fortune" of Mr. Lowe to reduce from 6d. to 3d. But on the re-assembling of parliament, Mr. Gladstone's government found themselves in a minority and resigned. Their successors retained the tax, reducing it however to 2d., the lowest rate at which it has ever stood. If the proposed repeal had been effected, chancellors of the exchequer would have been deprived of the most elastic of taxes, by the aid of which it is always possible to balance a budget; and it is difficult to see how the expenditure of subsequent years could have been met without reviving the tax.

Scope of the Tax.—The Income Tax Acts charge with duty income derived from every source in the United Kingdom, whether the person to whom the income accrues resides in the United Kingdom or abroad; and also income received in the United Kingdom by persons residing in this country from foreign or colonial sources. The duties are ranged under five schedules of charge (16 & 17 Vict. c. 34, § 2) as follows:

Schedule A imposes a duty on the owners of lands and houses in the United Kingdom. *Schedule B* on the occupiers of lands in the United Kingdom. *Schedule C* on annuities, dividends, and interest payable in the United Kingdom on government securities, British, colonial, or foreign. *Schedule D* on annual profits arising to persons residing in the United Kingdom from any kind of property wheresoever situate, or from any profession, trade, employment, or vocation wheresoever carried on; on annual profits arising to persons not resident in the United Kingdom from property situate, or from any profession, trade, employment, or vocation exercised, in the United Kingdom; and on interest of money, annuities, and other annual profits and gains. *Schedule E* on income derived from public offices or employments of profit, and on annuities, pensions, or stipends payable by Her Majesty or out of the public revenue of the United Kingdom. These familiar schedules of charge had their origin in 1803. The tax imposed by Pitt was levied on a general return made by each taxpayer of his income from every source. But in 1803 the present system of charging income-tax upon all property and profit at their first source was introduced, with the twofold object of reducing the temptations to evasion, and of preventing unnecessary disclosure of the amount of the total income of the taxpayers. It is to the adoption of this system that the success which has attended the administration of the English income-tax is mainly due. The duty charged on lands and houses is collected from the occupier, who is empowered, on payment of his rent, to deduct the duty applicable thereto; and the landlord in turn is entitled to deduct a proportionate

amount of duty from any ground rent, annuity, rent charge, interest, or other annual sum secured on the property. In like manner the profits derived from a trade or business are assessable in one sum on the company, firm, or person carrying on the concern, and the burden is distributed amongst the persons who are entitled to share in the profits, or to receive dividends, interest, or other annual payments thereout, by deduction of a proportionate amount of duty from each such payment. Dividends and interest payable out of untaxed sources, by the agents in England of foreign or colonial governments or companies, are charged in the hands of such agents; and, wherever practicable, provision is made for the assessment of the tax on distributors of profits, who have no personal interest in escaping payment, instead of on the ultimate recipients. The produce of the tax in 1803 under this system, at the rate of 5 per cent, was almost equal to the produce of the 10 per cent duty levied in 1799 upon the general returns of the individual taxpayers.

Basis of Charge.—Assessments under Schedule A on lands and houses are based in Great Britain on the rack-rental value of the property, subject to the deduction of land tax and certain other public burdens imposed by law on the owners; in Ireland on the poor-law valuation, subject to reduction in cases where such valuation exceeds the rental value. Until 1894 no allowance was granted in respect of the cost of repairs, insurance, and other expenses incidental to the maintenance of the property in a condition to command its existing rent. But the Finance Act 1894, which equalised the death duties chargeable on realty and personalty, also made provision for the reduction of the income-tax assessment on the gross value of lands and houses under Schedule A by a sum equal in the case of lands to one-eighth, and in the case of houses to one-sixth, of the assessment. Under Schedule B the farmer is charged on one-third of the annual value of his land, on the assumption that his profits may amount to one-third of his rent. Dividends and interest chargeable under Schedule C, and the salaries of offices chargeable under Schedule E, are assessed on the actual amount receivable within the year. Under Schedule D assessments are based on an estimate arrived at by taking, in some cases, the average profit for the three preceding years, in others, the profits of the preceding or the estimated profits of the current year. Mines are assessable under Schedule A, but according to Schedule D on the average profits of the five preceding years; and quarries, ironworks, gasworks, waterworks, railways, etc., on the profits of the year preceding. Relief is allowed at the end of the year when the profits have diminished.

Exemptions.—Of the exemptions from duty granted by the Income Tax Acts, by far the most important are those in favour of persons with small incomes. The extension of these exemptions has been a marked feature of the income-tax legislation of recent years. When Pitt introduced the income-tax in 1799, he exempted persons whose incomes were under £60, and imposed lower rates on incomes under £200. Subsequently, these exemptions were withdrawn entirely in the case of incomes from realised property; whilst in the case of profits from professions, trades, and offices, the limit of exemption was reduced to £50, and of partial relief to £150. On the revival of the tax by Peel in 1842, exemption was granted to persons whose total incomes from whatever source derived were under £150. This relief was somewhat curtailed in 1853, when Mr. Gladstone introduced an act which exempted incomes under £100, and imposed a reduced rate of duty on incomes between £100 and £150. The limit of exemption was again raised in 1876 to £150 by Sir Stafford Northcote (Lord IDDESLEIGH), and in 1894 to £160 by Sir William Harcourt, whilst the range of abatement was extended under successive Chancellors of the Exchequer (Mr. Gladstone in 1853, Mr. Lowe (Lord SHERBROOKE) in 1872, Sir Stafford Northcote in 1876, and Sir William Harcourt in 1894), until in 1898 Sir Michael Hicks-Beach (now Viscount ST. ALDWYN) introduced the present scale, under which incomes not exceeding £400 receive an allowance of £160; not exceeding £500, £150; not exceeding £600, £120; and not exceeding £700, £70. The relief of small incomes is obviously carried to a point far beyond the exemption of the necessary means of subsistence. The statesmen responsible for our finances have defended the relief mainly on the practical ground that it is impossible to levy the tax on the wages of labour; and to avoid the anomalies which would arise if the tax came into full operation at any given point, it has been thought better to graduate the transition. The relief given has also been defended on the ground that it tends to correct the inequality which arises from the greater proportional pressure of the taxes on articles of consumption on persons with small incomes. The Income Tax Acts also grant exemptions in favour of the public buildings of any college or hall in the universities, or of any hospital, public school, or almshouse; of income legally applicable and applied to charitable purposes; and of the property and income of registered friendly societies. Savings banks, industrial and provident societies, and the provident funds of trade unions are also entitled to a certain measure of relief. The exemption in favour of payments for life insurance, and of payments to secure deferred annuities, is especially note-

worthy. It is of course a partial exemption in favour of savings, and was introduced by Mr. Gladstone in 1853, admittedly as a concession to the general feeling that a man ought to have at any rate the opportunity of investing his savings without being liable to income-tax upon them (*Hansard*, vol. 125, p. 1385). The deduction under this head is restricted to a sum not exceeding one-sixth part of the assurer's chargeable income.

Inequalities.—The income-tax has been much criticised, especially in its earlier years, on the ground of its inquisitorial nature and of the alleged inequality of its incidence. Unfortunately an income-tax which entirely ceased to be inquisitorial would in great measure cease to be effective; but in England this objection has been minimised as far as possible by the assessment of income at its first source in the manner already described. The inequalities of the income tax have been much discussed both in and out of parliament, and the whole subject was thoroughly investigated by the select committees appointed for the purpose in 1851-52 and 1861. One of the main objections formerly alleged against the tax was that no allowance was granted from the assessments upon lands and houses in respect of the portion of the rent which was not available as income, being applied to the maintenance of the property in insurance and repairs. This defect has been remedied by the Finance Act 1894, not indeed by the allowance of the actual outgoings in each individual case, which would involve immense difficulty and friction, but by an all-round deduction calculated to do substantial justice in the great majority of cases. Other objections raised against the scheme of the tax were that it charged savings as well as expenditure; that it taxed all incomes at the same rate, whether they were permanent or temporary, spontaneous or earned; and that capital was sometimes taxed as well as income, as in the case of (1) capital given as the consideration for annuities for years or life, which is taxed in the annuity through which it is being repaid with interest, and (2) capital in the course of realisation through the working of mines, which is taxed in the assessment of the entire value of their produce. The committee of 1852 separated without being able to agree in any recommendation, and contented themselves with merely reporting the evidence taken. But the committee of 1861 arrived at the conclusion that no plan had been proposed to them which afforded a basis for a practicable and equitable re-adjustment of the income tax, and that the objections urged against it were objections to its nature and essence rather than to the particular shape which had been given to it.

Differentiation.—In recent years, however, the proposal to impose differential rates of duty under which industrial incomes shall be taxed more lightly than spontaneous incomes has been once more revived. The principle of a differential income tax has received the powerful support of J. S. Mill (*Principles of Political Economy*, bk. v. ch. 2, § 4). Mill would have preferred, if it were possible, to tax only the part of income devoted to expenditure, exempting that which is saved; on the ground that unless savings are exempted, the contributors are twice taxed on what they save, and only once on what they spend. But he considered that "if no plan can be devised for the exemption of actual savings, sufficiently free from liability to fraud, it is necessary, as the next thing in point of justice, to take into account in assessing the tax what the different classes of contributors ought to save. And there would probably be no other mode of doing this than the rough expedient of two different rates of assessment. There would be great difficulty in taking into account differences of duration between one terminable income and another; and in the most frequent case, that of incomes dependent on life, differences of age and health would constitute such extreme diversity as it would be impossible to take proper cognisance of." Fawcett (*Manual of Political Economy*, bk. iv. ch. 2) discusses the question at some length. He allows that the income tax ought not to be levied at a uniform rate, if the principle is admitted that each single tax should be so adjusted that every individual should contribute to it in proportion to his ability. He points out, however, that this is impossible in the case of other taxes, and considers that equality of taxation can be best secured, not by botching and patching each single tax, but by contemplating the revenue as a whole. After reviewing some of the obstacles to any attempt to levy the income tax in such a way that each individual should contribute to it in proportion to his means, he adopts the conclusion that the present method of levying the tax cannot with advantage be changed. And this is the view which has been taken by our greatest financial statesmen. Disraeli (Lord Beaconsfield), when he was for the first time chancellor of the exchequer in 1852, unsuccessfully proposed to introduce a differential tax, but he did not afterwards repeat the attempt. On the other hand Pitt, Peel, Gladstone, and others have resisted the introduction of a differential duty. On one of these occasions Mr. Gladstone said (*Hansard*, vol. 169, p. 1838), "Mr. Pitt and Sir R. Peel have both considered this question, and have both left the tax as a uniform income tax, not indeed as the image of perfection in our fiscal system, but as that form on which, as wise, prudent, and practical men, they found it necessary to take their stand."

Graduation.—Another important question in

relation to the income tax is that of graduation. The relief granted to incomes not exceeding £500 constitutes a substantial graduation of the duty in the case of the majority of the persons who fall within the scope of the tax. But in some quarters the opinion is held that the tax should be graduated not only degressively but progressively. The question of progressive taxation has been dealt with elsewhere (see GRADUATED TAXATION). Here it will suffice to mention that there are grave practical difficulties in the way of applying the principle of progression to the income tax. It certainly would not be worth while to abandon the system of assessing income at its source in order to impose higher rates of duty on the larger incomes; and even if the progressive duties were levied by a separate supplementary assessment, it would be impossible to prevent considerable evasion, and the procedure and penalties necessary to ensure a tolerable degree of accuracy would probably be regarded as very harsh and inquisitorial.

Incidence.—The English income tax is a combination of taxes on rent, profits, and wages, and its incidence is the same as that of separate taxes on those sources of income respectively (see TAXATION, INCIDENCE OF). Bastable (*Public Finance*, p. 436) says: "Taxes on rents, on the higher kinds of wages, or on employers' gains, are not easily shifted. Even in the case of interest, unless the growth of capital is checked, a tax tends to remain on the payer. Therefore speaking broadly we may say that the shifting of an income tax is not to be expected, and in the rare cases where it does happen, is brought about, either by a check in the growth of capital through diminished interest, or by disturbances in the relations of the several industries and trades through its action." And Seligman (*Shifting and Incidence of Taxation*, p. 179) says: "The tax on economic rent and net profits cannot be shifted, so that for all members of the community, except the wage earners, an income tax levied on pure income would indeed tend to stay where it is put. And in so far as the lowest incomes are exempted from the tax, the tendency would also be for the income tax on the labourer to stay where it is put."

Rate and Yield.—The income tax is imposed annually at rates varying according to the financial requirements of the year. The war tax of the early part of the century was levied chiefly at the rate of 2s. in the £. In 1842 the tax was imposed at the rate of 7d. in the £, and so remained for twelve years. It has varied greatly since, touching its highest point (1s. 4d. in 1855 and 1856) during the Crimean War, and its lowest, 2d., in 1874 and 1875. From 1888 to 1892 it stood at 6d., but rose to 7d. in 1893, and 8d. in 1894. The following table gives the rate and yield of the tax at decennial intervals since 1842.

Year.	Rate.	Net produce.	Yield per penny.
1842-43	7d.	5,405,161	772,166
1852-53	7d.	5,670,030	810,004
1862-63	9d.	10,731,673	1,192,408
1872-73	4d.	6,964,353	1,741,088
1882-83	6½d.	12,758,661	1,962,871
1892-93	6d.	13,439,300	2,239,856
1902-03	1s. 3d.	38,037,931	2,535,862

INCOME-TAX ON THE CONTINENT OF EUROPE.

Austria, p. 379; Bavaria, Wurtemburg, and Mecklenburg, p. 379; Germany, Prussia, and North German States, p. 378; Holland, p. 379; Italy, p. 379; Switzerland, p. 379.

Continental writers use the equivalents of the word "income-tax" (Einkommensteuer, impôt sur le revenu, imposta sui redditi) to designate a tax levied on individuals in respect of the whole of their income; the taxes which are deducted from income as it arises, or levied on the objects from which income is derived, are generally designated by other names (*e.g.* Ertragsteuer). Taxes of the first kind are, as a rule, included by scientific writers among "subjective" taxes, whilst the last-mentioned taxes are called "objective." The rate of income-tax in most continental countries is not adjusted from year to year according to the position of the budget, but is fixed once for all by statute.

Some kind of income-tax exists in Germany, Austria, Switzerland, Italy; in France the tax called "personnelle mobilière" could not be called income-tax in any sense, and the proposal of a regular income-tax has hitherto been considered too revolutionary to meet with any chance of success.

The principal characteristics of continental income-taxes will appear from the following statement:

1. *Germany.*—The empire has no direct taxes of any kind, but the individual states have income-taxes of some sort. They may be divided into three groups:

(*a*) *Prussia.*—Up to a recent period Prussia had a general income-tax, and certain additional objective taxes, viz. taxes on revenue from land, buildings, and trades. The latter, since the 1st April 1895, have been transferred to the local authorities. The central government now receives a general income-tax, that is, a tax on the whole income of each individual. The tax

is progressive, and rises by steps from about $\frac{5}{8}$ per cent to about 4 per cent. In addition to the general income-tax, there is a tax on income from funded property, which is a complementary tax (Ergänzungsteuer) intended to give an advantage to income derived from productive employment. It is levied on the capital value on the whole of each person's real and personal property (not including furniture and movable goods not attached to land, or used as plant for purposes of trade), and is about $\frac{1}{20}$ per cent of the assessed value of the capital which, taking the average return on capital to be 4 per cent, is equal to about $1\frac{1}{4}$ per cent on the income. The Prussian laws relating to income-tax and complementary tax are dated respectively 1891 and 1893; the latter did not come into force until the 1st January 1895.

(*b*) The other *North German States* (excepting *Mecklenburg*) and the *Grand Duchies of Baden* and *Hesse* have a general income-tax, and some additional objective taxes.

(*c*) *Bavaria*, *Wurtemberg*, and *Mecklenburg* have no general subjective income-tax, but a number of objective taxes, viz. taxes on income from land, from buildings, from trades, and from investments. Bavaria has a partial income-tax, intended to affect incomes not coming under the above heads, viz. income from (i) wages below $1\frac{1}{2}$ marks per diem; (ii) professions and farming; (iii) wages above $1\frac{1}{2}$ marks per diem, and salaries. In the first-named class the tax is a fixed amount for each person; in the second class the incomes are sub-divided into categories, each charged with a fixed rate varying from $\frac{1}{8}$ per cent to 1 per cent; in the third class the tax is progressive, the first 1020 marks of each income pay $\frac{1}{2}$ per cent, the next 510 marks $\frac{3}{4}$ per cent, and the rest of the income pays 1 per cent. Wurtemberg has also a similar partial income-tax.

2. *Austria* has a very complicated system. There is no general income-tax. The tax on revenue from land and from Austrian investments is generally deducted at the source. There is no tax on income from foreign investments, and Austrian loans are frequently issued as bearing interest free of income-tax. There is an assessed income-tax on (*a*) income derived from trade, small traders being exempted; (*b*) income derived from professions, salaries, and wages, workmen and domestic servants being exempted; (*c*) income from interest on loans from which the tax is not deducted on payment, and which is not exempted from tax. The tax on income from trades and on interest is 5 per cent, but traders are also subject to an objective tax; the tax on income from professions and salaries is progressive, and rises from 1 per cent to 10 per cent. Additions are made to the regular tax according to the financial requirements of each year, and as they have of late amounted to 100 per cent of the regular tax, the rates seem very high. It appears, however, that the authorities are very lenient in respect of the assessments, and only government officials, whose tax is deducted from their salaries, are the sufferers.

3. *Switzerland.*—In the Swiss cantons there is generally a property-tax, assessed on the capital value of all funded property, but the value in many cases is assigned on the basis of annual income. In addition to this property-tax, most cantons have a supplementary income-tax, which affects income not derived from taxed property. In Basel-stadt and in Basel-land there are general income-taxes in addition to the property-taxes; but in Basel-land, interest derived from invested capital is exempted from income-tax.

4. *Italy.*—All income, except income derived from land, is subject to a general income-tax, which, however, is deducted at the source in respect of dividends and interest on investments, payable in Italy, and salaries. The tax amounts to $13\frac{1}{2}$ per cent, but the various kinds of incomes are differentiated in the following manner: (*a*) income from investments is assessed at the full amount; (*b*) income derived partly from capital and partly from work, such as income derived from industry or trade, is assessed at $\frac{3}{4}$ of the full amount; (*c*) income derived exclusively from work, such as professional income, income derived from salaries or wages, not coming under the next head, is assessed at $\frac{2}{3}$ of the full amount; (*d*) income received in respect of salary by government, provincial, or municipal officials, is assessed at $\frac{1}{2}$ of the full amount. Special rules are applicable to farmers, and there is an elaborate system of exemptions and deductions in respect of smaller incomes.

5. *Holland.*—Recent legislation (1892-93) has introduced a system by which income from funded property is more heavily taxed than other income, though the distinction is not as marked as in Prussia. A property tax is charged on the surplus value of a person's real and personal property over 10,000 florins (property, the value of which does not exceed 13,000 florins, being exempt, and real property not being assessed at its full selling value). This tax rises from $\frac{1}{8}$ per cent to $\frac{1}{3}$ per cent, and —on the basis of an annual return on capital of 4 per cent—is equivalent to a tax on income rising from 1 per cent to 5 per cent; there is also a tax on income not derived from property, which rises from 2 per cent to $3\frac{1}{2}$ per cent (incomes not exceeding 650 florins being exempt).

INCOME TAX IN THE UNITED STATES. An income tax was levied by the act of Aug. 5, 1861, as part of the extraordinary financial legislation to supply revenue for carrying on the civil war. Incomes over £160 were taxed 3 per cent. The rates were increased by subsequent legislation, and incomes under £200 exempted. The tax dropped in 1872. The largest amount collected in one year was in 1866, $72,982,159 (£14,596,432), or about 14 per cent of the net ordinary receipts. The tax was never regarded with favour, and when a 2 per cent income tax with an exemption of £800 was included in the Wilson Bill, 1894, it was declared unconstitutional and withdrawn. An income tax is levied in a few states for local purposes, as in Massachusetts, on all professional incomes above £400, and in Pennsylvania on certain businesses.

[For the federal income tax, see *Reports of Commissioners of Internal Revenue;* and for local income taxes, consult index in Ely's *Taxation in American States and Cities.*] D. R. D.

INCONVERTIBLE CURRENCY (see IDEAL MONEY). Inconvertible is predicated of paper money for which coin is not obtainable on demand. A paper currency may become inconvertible by a suspension of specie payments, such as the English bank restriction (see BULLION COMMITTEE, REPORT OF); or it may be inconvertible from the first, like the French ASSIGNATS. It often purports to be based upon, or to "represent" real wealth,—for instance in Pennsylvania last century there was a paper currency based upon the security of land, "coined land" (Franklin), and in Connecticut taxes were assigned for the redemption of the paper.

The value of an inconvertible paper currency depends upon circumstances common to all kinds of money, namely the quantity and efficiency of the circulation compared with the volume of transactions; and circumstances peculiar to this kind of money, namely that the supply is not regulated by cost of production, that the demand is limited to a particular country, and varies according as the currency is received by the people with more or less distrust.

From these peculiarities we may judge of the use of an inconvertible currency. The advantage of dispensing with a reserve of precious metal—an advantage which may be very great in time of emergency such as war—is counterbalanced by the danger of depreciation through over-issue. This danger has often proved fatal: *e.g.* the French assignats which were depreciated to nearly $\frac{1}{100}$ (White), or even $\frac{1}{3000}$ (Macleod), of their face value; and the American "continental currency," which was depreciated to $\frac{1}{1000}$ (Walker). But this danger may be avoided by caution. The notes of the Bank of France were depreciated upon suspension of payment in specie by only two or three per cent during the revolution of 1848, and scarcely by $1\frac{1}{2}$ per cent during the war of 1870,—differences hardly appreciable in practice.

The value of an inconvertible paper money is liable to fluctuate from the absence of that automatic regulator which the foreign exchanges constitute in the case of convertible paper, and also from variations in popular confidence. A remedy for the evil of fluctuation—as well as that of depreciation—is afforded by the rule that the market price and the mint price of bullion should be the same (see DEPRECIATION). But the remedy may appear imperfect to those who hold that a suspension of payment tends to depreciate not only the value of notes in relation to gold, but also that of gold in relation to commodities—an opinion which has been disputed by Tooke and entertained by Walker (Tooke, *History of Prices*, pt. iii. especially ch. i., and summaries to the other chapters; Walker, *Money*, ch. xvii.). An ideally more perfect method of regulating an inconvertible paper currency would be to make its value correspond to a TABULAR STANDARD. A paper so regulated would have an advantage in point of stability over the precious metals. But the realisation of this idea is utopian.

[The subject is treated in almost all the general works on political economy and those of which the special subject is money. Mill's chapter on inconvertible currency (*Pol. Econ.*, bk. iii. ch. xiii.) leaves little to be desired except the idea of a standard other than the precious metals for testing the depreciation of paper money. This idea is supplied by Professor F. A. Walker in his *Money*, together with much interesting historical matter and numerous references (see also INFLATION).] F. Y. E.

INCORPORATION OF COMPANIES. Companies may be "incorporated" (invested with the rights of corporate bodies) by special act of parliament, by royal charter, or under the Companies Acts. The first-named method of incorporation is usually adopted in the case of railway, canal, and similar companies: the second has become exceptional, the incorporation under the companies acts being now most frequently resorted to. The Companies Act 1862, § 18, provides that upon the registration of the memorandum and—where necessary—of the articles of association, the registrar of joint-stock companies is to issue a certificate of incorporation, and that thereupon a company is to become capable of exercising all the functions of an incorporated company. As the memorandum and articles are complete on being signed by seven members, whose holding may be restricted to a merely nominal amount, it will be seen that the incorporation of a company does not in any way prove that it has any substantial existence. Under Companies Act 1900, § 6, a public company, though incorporated, is not entitled to commence business until cer-

tain specified requirements have been complied with. E. S.

INCORPOREAL PROPERTY. The legal distinction between things corporeal and incorporeal first appears in the Roman system. "Corporeal things are those which by their constitution admit of being handled, such as land, a man, clothing, gold, silver, and in a word numberless other things. Incorporeal things are those which cannot be touched, such as those which have only a legal existence, like an inheritance, a usufruct, or obligations however contracted" (*Institutes of Justinian*, bk. ii. pt. ii.). An inheritance in Roman law, it must be remembered, meant the sum total of the proprietary rights and liabilities of a person deceased. This legal distinction was itself derived from a philosophical distinction made by the Stoics between objects of sense and objects of the intelligence. But it involves a confusion of thought. For it is clear that the corporeal things of Roman law are the objects of rights and liabilities, whilst the incorporeal things are rights or liabilities themselves. In the English law of real property the distinction between things corporeal and incorporeal is used in a still more arbitrary way. Lands and houses are said to be corporeal hereditaments. A reversion, a remainder, rights of common, rent charges, and advowsons are said to be incorporeal hereditaments. Under the rules of the common law different modes of transfer were applicable to corporeal and to incorporeal hereditaments respectively. For the transfer of corporeal property a delivery actual or symbolic was necessary. It was said to *lie in livery*. Incorporeal property was supposed not to admit of delivery. It was therefore transferred by means of a writing and was said to *lie in grant*. This practical difference was, however, abolished by the act 8 & 9 Vict. c. 106. The distinction between corporeal and incorporeal hereditaments has no rational foundation. The corporeal hereditaments are objects of rights; the incorporeal hereditaments are peculiar species of rights. A right in possession is just as incorporeal as a right in reversion, whilst the object of the right, say a house, is equally corporeal in either case.

The distinction between things corporeal and things incorporeal may, however, be used in a more rational way. If by proprietary rights we understand rights available against all the world as opposed to rights only available against particular persons and capable of pecuniary valuation, we find that some proprietary rights have definite material objects corresponding to them, whilst other proprietary rights have no such object. Thus to the right of ownership always corresponds a particular horse, house, book, etc. But nothing of the sort corresponds to a copyright or patent right. He who has the copyright in a book has merely the right to prevent any other person from publishing it. He who has taken out a patent for an invention has simply the right to prevent any other person from applying the invention. It is not the control over the material object, the manuscript or the model,—for that the owner already possesses to the fullest extent, it is the forbearance of others from certain actions which makes a copyright or patent right valuable, and which may be said to be the object of either right. The same reflection applies to the right in a trademark.

The importance of rights of this class would hardly be recognised except in a high stage of economic and legal development. In so far as their recognition secures an adequate reward to the creative faculties of man, it is a potent means of economic progress. But the distinction between things corporeal and things incorporeal as hitherto drawn in legal systems is of little value for jurisprudence and of no consequence for economics.

INCREASING RETURNS. From the time when DIMINISHING RETURNS (*q.v.*) to agricultural industry first began to attract attention it was held that the returns to manufacturing industry increase with the increase of the absolute amount of labour employed. The contrast between agriculture and manufactures in this respect was pointed out by Malthus (*Nature and Progress of Rent*, 1815, p. 45), West (*Application of Capital to Land*, p. 7), and M'Culloch (*Political Economy*, 1st ed. pp. 277-278). It was elaborated by Senior (*Political Economy*, 8vo ed. pp. 81-86) and J. S. Mill (*Principles*, bk. iv. ch. ii. §§ 1-3). The tendency of later writers has been rather to soften the contrast; they insist upon the fact that up to a certain point agriculture gives increasing returns and that manufactures are subject to diminishing returns inasmuch as they require both raw materials and space (Marshall, *Economics of Industry*, 1879, pp. 21-26, 89-90). In *Principles*, vol. i. bk. iv. ch. xiii. § 3, Prof. Marshall says, "While the part which nature plays in production conforms to the law of diminishing return, the part which man plays conforms to the law of increasing return."

[An interesting review of the various standpoints from which the laws of increasing and diminishing returns have been laid down will be found in J. R. Commons, *The Distribution of Wealth*, 1893. See also J. H. Hollander in *Quart. Journ. of Ecs.*, January 1895.] E. C.

INCREMENT, THE UNEARNED. 1. *What is meant by the Unearned Increment.*—Although the germ of the idea may be traced in the *Wealth of Nations*, and is distinctly seen in Ricardo's *Principles*, the term "unearned increment" was first invented by J. S. Mill. By

"unearned increment" is meant that increase in the value of anything subject to a natural monopoly which is due not to the expenditure of capital, labour, or skill by the proprietor, but to the general progress of society resulting in an increased demand for that thing. An unearned increment may thus arise upon any kind of property of which the supply cannot be increased, *e.g.* the pictures of a dead artist. But the only kind of property usually considered with reference to the unearned increment is land. For land is the most important thing subject to a natural monopoly. Land is essential to the human race, as affording them room for their habitation, food to maintain life, and the raw material for all their industry. The extent of land available is also limited. True, the limit is not absolute. Much of the surface of the globe lies as yet unused and even unexplored. Even in civilised and populous countries there is always some land allowed to lie waste or far less improved than it might be. But the land not yet used or improved is land which, on account of position, or climate, or infertility, or some other disadvantage, is comparatively inconvenient. Mankind resort first to the land which is, under all the circumstances, most convenient to them. This land is so far limited that with the progress of society and the recourse had to less favoured land, economic rent makes its appearance. Economic rent, a thing quite distinct from rent in the ordinary sense, represents an unearned increment. But even if all the land belonging to a community were equally suitable for every purpose, its value would rise with the progress of the community and there would result an unearned increment.

The growth of the unearned increment in a progressive society is not uniform or uninterrupted. In the case of arable land, the unearned increment may be reduced or even annihilated by such causes as agricultural improvements or better means of communication which open up new sources of supply. Thus over a great part of rural England at the present day the rent actually obtainable represents a very moderate return on the capital which the landlords or their predecessors in title have expended on the improvement of the land and the buildings. Economic rent and unearned increment have not merely ceased to grow but have for the time being disappeared. Similar fluctuations may occur with reference to property in mines. Setting aside the depreciation resulting from progressive exhaustion, mines usually tend to become more and more valuable as society advances in prosperity. The increased demand for minerals and the improvement of means of transport bring an unearned increment to the mine-owner. But in this case also, the progress of society may open up new sources of supply and lessen the value of the old. Thus the working of silver mines in Europe has been made unprofitable by the competition of far richer mines in America and Australia. Here therefore economic rent and unearned increment have been annihilated. The most striking illustration of the unearned increment is afforded by land which derives its value from situations, such as the building sites in or near great cities. The advantage of situation is a monopoly of the strictest kind. It cannot be communicated to land which does not naturally possess it. It is so valuable that wealthy individuals or corporations will pay almost any price to obtain it. The shopkeeper who desires the custom of the rich must have premises in a fashionable street. The millionaire who desires the pleasures of good society must have a mansion in a fashionable quarter. A great bank must have its principal office in a central part of the capital. A great warehouse must be situated conveniently with respect to docks or railway stations. Many persons are obliged to live close to the place where they do their work, and there is a great deal of work which can be performed only in places possessing a peculiar advantage of situation. Owing to these and similar circumstances the competition for good sites in a great city is extraordinarily keen. Within recent years land in the city of London has been known to sell at the rate of £150,000 per acre, or higher, whilst excellent arable land within thirty miles of London has been sold for considerably less than £10 an acre. The whole difference between these prices may be regarded as an unearned increment (see BETTERMENT).

2. *The Unearned Increment as a subject of Taxation.*—With the progress of democratic ideas and of the desire to impose taxation as far as possible upon property, it was natural that proposals should be made for transferring to the state the unearned increment, which is the result not of the exertions of proprietors, but of the general growth of society. Such proposals differ chiefly as they are more or less far-reaching. They may be distinguished into three classes accordingly as they (1) contemplate the transfer of the ownership of land from private persons to the state, or (2) whilst contemplating the continuance of private property in land, would involve the appropriation of the unearned increment by the state, or (3) provide for such appropriation only in the case of unearned increment arising from special causes.

3. *Criticism of these Proposals.*—(1) Proposals of the first class are sometimes extended to every species of landed property, and sometimes are restricted to certain species on which the unearned increment happens to be unusually large, such as mines or building sites in cities and towns. When they extend to all kinds of land they amount to schemes for what is termed land nationalization, a subject too extensive

to be properly discussed here (see LAND, NATIONALIZATION OF). Shortly it may be said that such proposals have the appearance of a certain logical completeness, but would involve enormous practical unfairness in execution. Proposals for the transfer of particular kinds of landed property from private individuals to the state may be less difficult to carry out although less logical in theory. Upon the foundation of a colony it may be practicable to retain as a public patrimony land possessing special advantages of situation or of mineral wealth. But in any old country where private property in land of all kinds has been fully established for many centuries, schemes for the acquisition of urban land by municipal bodies, or of mines by the state, are not likely to be carried out. If fair compensation were given the operation would be perilous, for the public authority would have incurred the fixed charge of an immense debt in return for a property which might at any moment suffer depreciation through a decline of national prosperity. If no compensation or nominal compensation were given, the confiscation of the land in question would involve such an attack on rights of property as would amount to a revolution. In this case it is unlikely that private ownership of other sorts of land could survive.

(2) Proposals of the second class would not involve the abolition of private property in land. They are directed to the taxation of landowners to the extent of the unearned increment. J. S. Mill proposed and Mr. Dawson and other writers have repeated the suggestion that all the land in the United Kingdom should be subjected to a periodic official valuation and that the state should take for itself any increase in value which could not be shown to be due to the labour and capital of the proprietors. Schemes of this kind are not open to the moral or political objections which may be made to all schemes of confiscation. But their execution would involve serious difficulties. If Mill's proposal were applied to agricultural land, it would be found almost impossible to say how much of a growth in value was due to the general progress of society and how much to improvements effected by the proprietors. If the state were to call periodically for their accounts and to allow them the current rate of interest on the capital shown to have been spent in improvements, it would discourage all the most intelligent and useful improvers. For the return upon agricultural improvements is not really uniform. Some never repay their cost; others are highly profitable. It may also be urged that if the state is to deprive landowners by special enactment of increase of wealth due to the progress of society, the state should also guarantee them against loss of wealth due, not to their own default, but to changes in economic conditions.

(3) Schemes which provide for the appropriation by the state of unearned increment arising from certain special causes only must be considered each on its own merits. One of the most familiar schemes of this kind is known as Betterment (see BETTERMENT). Its object is to secure for municipal authorities the whole or part of the increase in value accruing to town property from the execution of improvements at the public expense.

4. *Conclusion.*—In conclusion, it may be said that no practicable scheme for securing the unearned increment on land to the state has yet been devised. Further it may be doubted whether the subject is of really momentous consequence. It is true that in Great Britain during the past hundred years, and still more in new countries such as the United States, the unearned increment on certain kinds of landed property has been prodigious and has resulted in vast private fortunes. It is natural therefore that reformers should find in the appropriation of the unearned increment a substitute for every other kind of taxation, and should debate upon the good which the national and local authorities might have done with this vast revenue which nobody would have missed. A sceptic might reply that a great revenue which is raised without being felt is usually spent in the most foolish and mischievous manner, as may be seen by the use which our American kinsmen have made of the resources derived from their stringent tariff. But further, it may be urged that the state has an indefinite power of taxation, and that under a democracy, which is the most costly of all forms of government, taxation is always becoming heavier, and is more and more thrown upon property, especially, where landowners are few, upon landed property. Under these circumstances, it is certain that the national and municipal authorities will in future draw an ample revenue from landed property whether or no any unearned increment has accrued thereon. Lastly, it may be said that the interest taken in the subject of the unearned increment in this country is due to the comparatively small number of landed proprietors amongst whom that increment has been shared. In a country of small proprietors the subject would be too invidious and would be abandoned to theoretical writers.[1]

[See Adam Smith, *Wealth of Nations*, bk. v. ch. ii.—Ricardo, *Principles of Political Economy of Taxation*, ch. x.—Mill, *Principles of Political*

[1] The "unearned increment" on land has been referred to throughout this article, as the examples which economic writers have taken have been practically without exception drawn from that particular class of property. The doctrine is, however, theoretically as applicable to every other description of property—for example, to shares in trading companies. Such shares have been known to have risen in price from £1 to £40 in a short space of time. Would the £39 in this case be "unearned increment"?

Economy, bk. v.—and *Papers on Land Tenure in Dissertations and Discussions*, vol. iv.—Cobden's later speeches.—Dawson, *The Unearned Increment*. Many references to the subject are scattered through the extensive literature relating to RENT.] F. C. M.

INCREMENTUM or CREMENTUM, a term used in mediæval accounts. To understand its exact meaning requires some knowledge of the manner in which a statement of receipt and expenditure was drawn up in the middle ages. The simplest way to explain it will be to take a particular example. Suppose we consider the form of a bailiff's yearly account of the estate under his management. First comes the *onus* or charge beginning "This accountant is charged with," or "This accountant renders account of so much for so and so," mentioning all the items of the year's income: then follows the expenditure account, beginning "of which (money) so much (is expended) in so and so," mentioning all the items of expenditure. At the end, or in the case of the Pipe Rolls at the beginning, is the amount of money handed over by the accountant, and finally the statement *debet* or *quietus est* or *habet de superplus* with the sum owed by him to the estate or by the estate to him, as the case might be. The difference between this and a modern statement of receipt and expenditure is not apparent on the face of it. Consider, however, one typical item, the rental account for instance. On the charge side will be simply: "Rents—so much," without any particulars. On the expenditure side, before the sums spent in repairs etc. will be a number of entries such as "so much for rent unpaid for such and such a house because unlet," or "because its rent has been reduced by that amount," or "because it is in ruins." In fact the charge is the whole rental of the estate as ascertained by a survey made at some time, it might be years before the bailiff entered into office, any diminution of rental being accounted for as a modern bailiff would account for expenditure. Any increase in this rental, owing to new sources of revenue being developed since a survey was made, was called *Incrementum*, and was either accounted for under a separate sub-heading or added to the amount of the charge year by year. This system was carried out to a great extent in all mediæval accounts, the tendency being, whenever possible, to charge the accountant with a definite sum, which did not vary from year to year, and to consider any fluctuations as distinct items of revenue or expenditure under the names of *incrementum* and *allocutiones* or *acquietantiæ*. One of the principal fiscal provisions of Magna Charta, as issued in 1215, was, that the counties should be kept at their old ferms *absque ullo incremento* (see FARM OF THE COUNTIES, PIPE ROLLS).

[Madox, *History of the Exchequer*, London, 1769.] A. E. S.

INDEMNITÉ (Fr.). Besides the ordinary acceptation of the word indemnity as compensation for damage by individuals or prejudice caused by acts of the authority in the general interest, it is employed in France to designate the payment received by persons exercising public functions unpaid. The indemnity of senators and deputies is fixed by the electoral laws of 1875 at fr. 9000 (£360) a year. If they already exercise an office paid by the state their salary is suspended while they sit in parliament, unless the salary is greater than the indemnity, in which case they receive the difference. The law declares expressly that the functions of municipal councillors are gratuitous, the only exception being the right of the council to allow a sum of money to the mayor to uphold the dignity of his office; but the Paris municipal councillors, taking advantage of the distinction made between salary and indemnity, have for some years past voted themselves annually an indemnity, first of fr. 4000 (£160) each, afterwards increased to fr. 6000 (£240) for their personal expenses. The illegality of the vote is incontestable, but the government has so far tolerated the infraction of the law. T. L.

INDEMNITY. A promise whereby one person undertakes to indemnify (to hold harmless) another against a liability undertaken on behalf of indemnifying party. An indemnity must be distinguished from a GUARANTEE (*q.v.*). If a person is entitled to indemnity against a liability he may, when sued in respect of such liability, serve a "third party notice" on the indemnifying party, who will thereupon become bound by the judgment, unless he becomes a party to the action and disputes his liability. E. S.

INDENTURE. A deed under seal, if made between two or more parties, is called an "indenture"; if it is the deed of one party only, a "deed poll." The first-mentioned name came to be used as deeds executed by several parties were generally copied out twice on the same parchment, which was then separated by an indented division. E. S.

INDEX NUMBERS are used to indicate changes in the value of money. The objects for which this measurement is undertaken are thus well stated by Sir R. Giffen (Second Report of the committee appointed for the purpose of investigating the best method of ascertaining and measuring variations in the value of the monetary standard. Report of the British Association, 1888):—(1) The fixation of rents or other deferred payments extending over long periods of time, for which it has been desired to obtain a currency of a more stable sort than money is supposed to be. (2) To enable comparisons to be made between the value of money incomes in different places, which is often an object of great practical interest: not only

individuals contemplating residential changes, but also governments and other large spending bodies, spending money in widely distant places, having to consider this question. (3) To enable historians and other students making comparisons between past and present to give an approximate meaning to the money expressions which they deal with, and say roughly what a given fine, or payment, or amount of national revenue or expenditure in a past age would mean in modern language. To which some would add: (4) To afford a measure of the extent to which trade and industry have been injuriously affected by a variation in prices; and of the correction which it would be desirable to apply to the currency.

An index number is constructed by combining several items, each of which is a ratio between the price of a certain article at a particular date under consideration (*e.g.* last year or month) and the price of the same article at a period taken as base or standard (*e.g.* 1867-77, in the index number constructed by Mr. Sauerbeck, *Journal of the Statistical Society*, 1886 and 1893). These ratios are generally expressed as percentages. *E.g.* the percentage for *flour* in 1885, as given by Mr. Sauerbeck, is 63; meaning that the price of flour in 1885 is to the average price of the same article in 1867-77 as 63 : 100. The term index number is sometimes applied (*e.g.* by Mr. Sauerbeck, *op. cit.*) to each of these items, as well as to their combination.

The percentages are usually compounded by taking an AVERAGE of them. But a result of equal generality may be obtained by taking their sum. One of the best-known index numbers, that of the *Economist*, is thus constructed. Twenty-two articles having been selected, the price of each article at the current date compared with its price at the standard period (1845-50) is expressed as a percentage; and the sum of these percentages is put as the index number. Thus the *Economist* index number for the year 1873 is 2947; such a sum is easily reduced to the form of an average by simple division (*e.g.* $2947 \div 22 = 134$). Accordingly in what follows it will be sufficient to consider the latter form only.

The construction of an index number presents the following problems: (*a*) What are the commodities of which the prices are to be taken? (*b*) How are the prices to be ascertained? (*c*) How are the ratios between the prices of each article at the current and the standard dates to be combined?

The answers to these questions vary according to the purpose in hand (above, pp. 384-5). As appropriate to the first purpose, a standard of deferred payments, two methods present themselves, viz. to arrange that the debtor should pay, the creditor receive, either (1) the same quantity of goods and services, the same amount of utility, so to speak; or (2) the product of the same quantity of labour—or more exactly effort and sacrifice.

Of these methods the former has been more generally accepted. It is adopted for instance by the British Association Committee already referred to, as *par excellence* the measure of the change in the value of the monetary standard. The former method is indeed more practicable, perhaps more intelligible. However, in favour of the latter there are some weighty considerations and authorities. It seems to be the nearest possible approach to Ricardo's conception of a commodity invariable in value, "which at all times requires the same sacrifice of toil and labour to produce it" (*Principles*, iii. ch. xx., "On Value and Riches," cp. Mill, bk. iii. ch. xv., "On a Measure of Value"). "A standard," says Mr. Leonard Courtney, "should be something which as far as possible involves the same labour and the same sacrifice in obtaining it" (*Nineteenth Century*, March 1893). Prof. Marshall, in his evidence before the royal commission on gold and silver, says, speaking of appreciation of gold: "When it is used as denoting a rise in the real value of gold, I then regard it as measured by the diminution in the power which gold has of purchasing labour of all kinds—that is, not only manual labour, but the labour of business men and all others engaged in industry of any kind" (Question 9625).

If the first method is adopted, the answers to the questions above set are as follows: (*a*) The commodities of which the prices are to be taken should be articles of consumption rather than materials and implements. Payments for personal services should be included, but not wages in general. (*b*) Retail prices should be used. (*c*) The proper combination of the ratios is an average of the kind technically called *weighted* (see AVERAGE). The general principle according to which the weights are to be assigned is that they should represent the importance of each commodity to the consumer. But this idea may be embodied in different plans.

1. One plan is to assign as the weight of each percentage, or ratio between prices, the value of the corresponding commodity at the initial or standard period. According to this plan the index number is the ratio between these two values: the quantities initially consumed at the prices of the current date, and the same quantities at the standard prices. This method is exemplified by Sir R. Giffen's estimate of the change in the value of money between 1873 (and 1883) and *earlier* years, in his report on prices of exports and imports, 1885, table v.

2. Another plan is to assign, as the relative importance of each percentage, its value at the particular epoch, the current year. This plan is adopted by Mr. Palgrave in his memorandum

on *Currency and Standard of Value* . . . in the third report of the royal commission on depression of trade and industry, table xxvii.

3. According to another plan, the index number is the ratio between the following two values: the quantities consumed at the current date at the current prices, and the same quantities at standard prices. This plan is adopted by Mr. Sauerbeck (*Journ. Stat. Soc.*, 1886, p. 595).

4. Or, instead of taking either the initial quantities or those of the current date, a mean between the two may be taken. This is the plan adopted by the British Association Committee. They estimate "the average national expenditure on each class of article at present and for the last few years"; and put for the relative importance of each commodity a round number corresponding to that estimate. Thus the estimated expenditure per annum on *wheat* is £60,000,000, and on *meat* £100,000,000: that is respectively 6·5 per cent, and 11 per cent of the sum of the corresponding estimates for all the commodities utilised by the committee. As convenient approximations, the weights five and ten are recommended by the committee.

If the index number based on labour (see above, p. 385), rather than on consumption, is adopted as the standard for deferred payments, it would be proper by analogy to take as the measure of appreciation or depreciation the change in the pecuniary remuneration of a certain set of services, namely all, or the principal, which are rendered in the course of production throughout the community during a year, either at the initial or the current epoch; or some expression intermediate between the two specified. But it may be doubted whether the statistics requisite for this method are available.

With regard to the second and third of the purposes above enumerated, the determination of the comparative value of money at distant places and remote times—one or other of the two methods indicated would seem to be theoretically proper.

For the fourth purpose, the regulation of currency, the proper construction of the index number would seem to be as follows: (*a*) The "articles" of which the prices are taken into account should be both commodities and services; (*b*) both wholesale and retail prices should be used; (*c*) the relative importance of each article should be proportioned to the demand upon the currency which it makes. But here as in other parts of the subject theory halts a little, and statistics lag far behind theory.

Considering the theoretical doubts and statistical difficulties which attend the determination of *weights* proper to each purpose, there is much to be said in favour of assigning equal relative importance to all the items; especially if care is taken to include many articles such as *corn*, *cotton*, etc., which for any of the purposes which may be contemplated must be of first-rate importance. Such is the character of some of the principal index numbers which have been constructed—those of the *Economist*, of Jevons, of Soetbeer, and of Mr. Sauerbeck.

In the construction of such an index number the use of the arithmetic mean is not imperative. Jevons employs the geometric mean. His reasons for preferring it are not very clear (the "Variation of Prices," *Currency and Finance*, p. 120). A more intelligible explanation is given by Prof. Westergaard (*Wahrscheinlichkeitslehre*) —the geometric mean alone presents a certain consistency between its results, which may be thus indicated. Taking any three dates, x, y, z, put the symbol $\left(\frac{y}{x}\right)$ to denote the index number for the date y referred to the date x as standard; with similar interpretations for $\left(\frac{z}{x}\right)$ and $\left(\frac{z}{y}\right)$. Then $\left(\frac{y}{x}\right) \times \left(\frac{z}{y}\right) = \left(\frac{z}{x}\right)$, as it *ought* by analogy with perfect measurements in other sciences, if the geometric mean be used, but not if any other mean be employed. The geometric mean has also the advantage of being less liable than the ordinary average to be unduly affected by extremely high prices (*Report of the British Association*, 1887, p. 283). The great objection to the geometric mean is its cumbrousness.

There is another kind of mean which has some of the advantages of the geometric, and is free from its essential disadvantage; namely, the median (see AVERAGE), which is formed by arranging the items in the order of magnitude, and taking as the mean that figure which has as many of the items above as below it. For instance the median of the forty-five percentages on which Mr. Sauerbeck's index number is based was, for 1892, 66; while the arithmetic mean was 68. It is difficult to see why the latter result is preferable to the former; if what is required is an *index* of the change in general prices, not specially referred to any particular purpose, such as of securing a constant benefit to a legatee.

The perplexity of a choice between such a variety of methods is much reduced by the two following considerations. *First*, beggars cannot be choosers. The paucity of statistical data (see the report drawn up by Sir R. Giffen in the *Report of the British Association* for 1888, p. 183) restricts the operation. Thus for the purpose of index numbers based on consumption (above, p. 385) retail prices are theoretically appropriate; but "practically it is found that only the prices of leading commodities, capable of being dealt with in large wholesale markets, can be made use of" (Giffen, *loc. cit.*). *Second*, the difference between the results of different methods is likely

to be less than at first sight appears. For instance, the probable difference between the index number constructed by the British Association committee, and six others which have been proposed by high authorities—supposing the different methods to be applied to the same data, viz. the prices of twenty-one articles specified by the Committee may thus be expressed. The discrepancy which is as likely as not to occur between the committee's and other results is from 2 to 2·5 per cent. The discrepancy which is very unlikely to occur is from 8 to 11 per cent (*Report of the British Association* for 1888, p. 217). In fact, the index number for the year 1885, as determined from the same data by seven different methods, proved to be 70, 70·6, 73, 69, 72, 72, 69·5 (*ibid.* p. 211).

The practical outcome of these two considerations is thus well expressed by Giffen (*loc. cit.* p. 184), "The articles as to which records of prices are obtainable being themselves only a portion of the whole, nearly as good a final result may apparently be arrived at by a selection without bias, according to no better principle than accessibility of record, as by a careful attention to weighting. . . . Practically the committee would recommend the use of a weighted index number of some kind, as, on the whole, commanding more confidence. . . . A weighted index number, in one aspect, is almost an unnecessary precaution to secure accuracy, though, on the whole, the committee recommend it."

[Airy, G., *Memoirs of the Astronomical Society*, xxviii. (refers to a physical problem which has considerable analogy to the determination of the changes in the value of money with respect to things in general; namely, the determination of the motion of the solar system in space—relative to the stars in general).—Bela Foldes, W., *Jahrb. f. Nat. Oekon.*, 1882; *Statistische Monatsschrift* (Vienna), 1881 (refers to changes in the value of Austrian inconvertible currency).—Bourne, S., *Journal of the Statistical Society*, 1879 (exemplifies the principle of *weight*).—Cross, W., *Standard Pound* v. *Pound Sterling*, (1856) (proposes a change in the standard *per saltum*, as often as the index number changes to the extent of say 3 per cent).—Drobisch, M., *Bericht. (states different methods of constructing an index number based on consumption).—Soetbeer, *Materialien zur Währungsfrage*, 1886, brought up to date in the *Jahrbücher f. Nat. Oekon.*, 1892 (one of the most important contributions to theory and practice).—Walker, *Money and Trade*, and *Political Economy Appendix* (regards the use of a tabular standard as limited).—Walras, *Théorie de la Monnaie*, 1886 (proposes to regulate currency by means of a proper index number).—United States report on retail prices by the Senate Committee on Finance, 1892 (an interesting verification of the principle that simple and "weighted" averages are not likely to differ very much).] F. Y. E.

INDIFFERENCE, LAW OF, a designation applied by Jevons to the following fundamental proposition: "In the same open market, at any one moment, there cannot be two prices for the same kind of article."

This proposition, which is at the foundation of a large part of economic science, itself rests on certain ulterior grounds: namely, certain conditions of a perfect market. One is that monopolies should not exist, or at least should not exert that power in virtue of which a proprietor of a theatre, in Germany for instance, can make a different charge for the admission of soldiers and civilians, of men and women. The indivisibility of the articles dealt in appears to be another circumstance which may counteract the law of indifference in some kinds of market, where price is not regulated by cost of production.

[Jevons, *Theory of Exchange*, 2nd ed. p. 99 (statement of the law).—Walker, *Pol. Econ.*, art. 132 (a restatement).—Mill, *Pol. Econ.*, bk. ii. ch. iv. § 3 (imperfections of actual markets).—Edgeworth, *Mathematical Psychics*, pp. 19, 46 (possible exceptions to the law of indifference).]

F. Y. E.

INDIRECT TAXATION, in the ordinary English use, is that which is "demanded from one person in the expectation and intention that he shall indemnify himself at the expense of another" (Mill, *Principles*, bk. v. ch. iii. § i.), *i.e.* it comprises taxes on commodities levied from producers or dealers.

The administrative application of the term, at least on the continent, is wider. "Indirect taxation is levied on the occurrence of a fact, act, or exchange; it does not require lists of contributions regularly or periodically established" (Leroy-Beaulieu, *Science des Finances*, t. i. p. 273, cp. Wagner, *Finanzwissenschaft*, vol. ii. p. 239). It therefore covers taxes on successions and gifts as well as the stamp and registration duties.

According to the PHYSIOCRATS (*q.v.*) all taxes, except that levied on the *produit net*, were indirect, since they were necessarily shifted to it (see DIRECT TAXATION and TAXATION).

[A. Wagner, *Finanzwissenschaft*, vol. ii. pp. 239-247.] C. F. B.

The passage from Mill quoted above includes, among the class "Indirect," such taxes as—

"the excise or customs. The producer or importer of a commodity is called upon to pay a tax on it, not with the intention to levy a peculiar contribution upon him, but to tax through him the consumers of the commodity, from whom it is supposed that he will recover the amount by means of an advance in price" (Mill, *Principles*, bk. v. ch. iii. § i.).

Mill's definitions of direct and indirect taxes make the difference to turn upon the mode of incidence, a division probably originally suggested by the theory of the PHYSIOCRATS (*q.v.*) that all taxes being paid ultimately out of the "net produce" of land, it would be better to impose a single tax charged *directly* on the landowners than to assess the fund *indirectly* by other taxes. But, as Sidgwick (*Principles of Political Economy*, bk. iii. ch. viii. § 8) says—

"we can only partially succeed in making the burden of 'direct' or 'indirect' taxes fall where we desire; the burden is liable to be transferred to other persons when it is intended to remain where it is first imposed; and, on the other hand, when it is intended to be transferred, the process of transference is liable to be tardy and incomplete."

Thus—

"In common parlance the distinction between direct and indirect taxes is practically relegated to the mind of the legislator: what he wishes to have borne by the original taxpayer is called a direct tax, what he intends to have borne by some one else than the original taxpayer is called indirect. Unfortunately the intention of the legislator is not identical with the actual result. We must, then, either revise our nomenclature or declare the present distinction of little value" (Seligman, *The Shifting and Incidence of Taxation*, 1899, p. 311).

A distribution of taxes subject to change with every new theory of incidence must necessarily, whatever may be its value in economy, be almost useless for administrative purposes. Hence Bastable states that—

"practical financiers have adopted a different basis of distinction, and regard those taxes as direct which are levied on permanent and recurring occasions; while charges on occasional and particular events are placed under the category of indirect taxation" (*Public Finance*, ed. 1903, p. 271).

Under this method the income tax is direct, and the excise and customs indirect, as in Mill's definitions, but the death duties from direct become indirect. This classification, which is based on the possibility or otherwise of having a list of taxpayers (*rôle nominatif*) is that adopted in France. P. Leroy-Beaulieu objects to it as empirical, and confounding things which ought to be distinguished. He would define a tax as direct if it was intended to charge the taxpayer immediately and proportionally to his fortune or revenue, and as indirect if otherwise (*Science des Finances*, 1899, vol. i. 273). Wagner (*Finanzwissenschaft*, 1890, vol. ii. 237-247) gives a full account of the controversy with respect to terminology. He favours a definition based on incidence.

Bastable, desirous of retaining the broad line of division that the old meaning of "direct" and "indirect" gave, observes that —

"if we take the terms, not as giving a complete classification of taxes, but as marking the presence or absence of a certain characteristic, they may be employed with advantage, but rather to suggest reasons for discrimination than to definitely settle results." He starts, then,

"with the conception of direct taxes as those levied immediately on the 'subjects,' or ultimate bearers, of the charge, and therefore embracing taxes on income and property, or on their component parts, in opposition to duties on commodities and on exchange, where there is a shifting of the burden from the immediate payer to the 'subject' which justifies the name of 'indirect,'"

and proceeds to consider the merits and defects of each class. On the borderland between direct and indirect taxes he places taxes on transfers, on contracts, on communication and transport, and, in short, the numerous charges on acts (pp. 349-356).

In favour of direct taxation may be urged facility and small cost of collection, combined

with definiteness of yield, whilst against it are the unpopularity of the collector's demand for payment, the difficulty of taxing directly the poorer members of society, and the inelasticity of certain forms of charge, *e.g.* on lands and houses, the assessment of which is usually of necessity fixed for some years. Indirect taxation is more costly to collect, and more variable in its yield, owing to the power of increasing or diminishing consumption of taxed commodities at will, but it is hardly felt at the time of payment, is available for reaching the poorer classes, and in times of prosperity is automatically expansive. Its special drawback is the danger of loss through the disturbance of industry, particularly by excise interference with freedom of manufacture. (For the point of view of a finance minister, see Hansard, [162] 583-585.)

"In spite of the evils that are associated with indirect taxation, and are only partially prevented by fiscal improvements, it has been found necessary by all the great nations of modern times to retain customs and excise duties as an important part of the tax system. In England, Russia, and France the excises and customs yield about half the national revenues. In Germany the imperial legislation regulates the customs and excises on salt, tobacco, spirituous liquors, beer and sugar, and with three exceptions the constituent States do not tax these things. In the United States the federal government draws most of its revenue from excises and customs in nearly equal proportion. In comparing direct and indirect taxes both must be considered as parts of the whole tax system. The chief merit in either case is that the one remedies the defects of the other." (Nicholson, *Elements of Political Economy*, 1903, p. 481.) (See DIRECT TAXATION. COST OF COLLECTION OF TAXES. TAXATION.)

F. A.

INDIRECT UTILITY. A distinction has been drawn between direct and indirect utility. "Direct utility," Jevons says (*Theory of Political Economy*, ch. iii.), "attaches to a thing like food, which we can actually apply to satisfy our wants. But things which have no direct utility may be the means of procuring us such by exchange, and they may therefore be said to have indirect utility."

Jevons refers, in connection with this, to the following passage in Garnier, *Traité d'Économie Politique*, 6th ed. ch. i. § iii. : "Utility is direct or indirect. It is direct in the case of things the immediate application of which satisfies our wants ; a loaf of bread possesses this utility for a man suffering from hunger. It is indirect in the case of things which are only the means whereby we can procure what is necessary to satisfy those wants, which they cannot themselves satisfy. For instance, a man possesses two pieces of bread : with one he satisfies his hunger ; this is an example of direct utility : urged by thirst, he exchanges the other for something to drink ; this is an example of indirect utility.

"Utility which is no longer direct acquires the quality of being interchangeable, and becomes also *Value*" (see UTILITY).

INDIVIDUALISM. This term was applied by J. S. Mill (*Socialism*, p. 114) to that system of industrial organisation in which all initiative is due to private individuals, and all organisation to their voluntary agreement. Under such a system the functions of the state are restricted to the maintenance of order, including the defence of the country, the enforcement of contracts, and in general to supplying the conditions necessary to the working of voluntary action. The natural antithesis to individualism is COLLECTIVISM or we may say SOCIALISM, a system under which industry is directly organised by the state, which owns all means of production and manages all processes by appointed officers.

In its extreme form individualism would deny to the state industrial activities of every sort, even the construction of roads, bridges, and harbours, and the coinage of money. Going still farther, it is discovered that the so-called repressive functions of the state are mostly industrial. Lawsuits are a species of compulsory arbitration of disputes, including industrial ones. The punishment of theft is the repression of a personal activity known to be pernicious. A few have been found who disapprove even of these functions of the state and urge their entire abolition. They are properly known as anarchists or disbelievers in any government, and they represent the utmost range of individualism. In the following discussion it will be understood that only a qualified individualism is intended, that is to say, such a compromise with the opposite principle as has been represented by the most individualistic of modern states.

The essential features of individualism are, (1) private property in capital, to which are added almost of necessity the rights of bequest and inheritance, thus permitting unlimited transfer and accumulation. (2) Competition, a rivalry between individuals in the acquisition of wealth, a struggle for existence in which the fittest survive.

It is evident that both these principles have advantages and disadvantages for society. In entering a field where controversy has been violent, only a brief enumeration of admitted tendencies is appropriate. Among the advantages of individualism should first be mentioned the enormous incentive it furnishes to the accumulation of property and so indirectly to the production of wealth. Tasks are undertaken in hope of unusual personal advantage which would not be undertaken by a man receiving a moderate and fixed reward not influenced by special achievements. It is plain that a

considerable class of persons are thus induced to exert to the utmost faculties which would otherwise lie dormant. Further, the control of funds of capital by individuals enables them to develop ideas of great value to society, but ideas which society would not value until so developed. Thus it is claimed that individualism not only excites ingenuity but gives it scope, and utilises it in a way that socialism would not so obviously do. Finally, quite apart from all material advantages there should be noted the intellectual qualities which individualism develops—shrewdness, penetration, aggressiveness, and independence. These characterise in a high degree the foremost members of an advanced individualistic society.

Certain disadvantages are, however, equally obvious. The principle of natural selection seems to be abnormally active in a vigorous individualistic society. If great incentives are furnished to certain men, their number is increasingly small. The hope of accumulation becomes a forlorn hope to most men in a highly organised individualistic society, and they suffer from a dearth of incentives destructive even of the simplest economic virtues. Thus the impetus given to production by individual incentives is partly neutralised by the deterioration or arrested development of the masses of the productive population from whom these incentives are increasingly withheld. It is further neutralised by the fact that the control of capital means also privilege in consumption. If men of wealth are merely capitalists, and consume moderately, the only danger arising from their disproportionate ownership is that of excessive formation of capital, but to this danger we must add that of occasional spendthrift consumption, alike detrimental and irritating to society. The tendency of capital to accumulate in the most competent hands has also its counterpart in the chances of inheritance, which often give it to those who are incompetent.

The more conspicuous disadvantage of individualism is the waste involved in competition. Its cost in active antagonisms and divided efforts is enormous, and has been frequently discussed. Finally, the intellectual qualities developed by individualism are more or less balanced by the ethical weakness which it involves. Individualism is avowedly egoistic. Competition has often seemed ruthlessly to eliminate ethical sentiment. At the best it threatens its existence.

It is impossible to weigh the merits and demerits of individualism without a fuller consideration of socialism than present data will allow. Suffice it to say that its disadvantages have been felt so seriously as to lead many countries of late to modify the system by increasing the industrial functions of the state.

The experiences of corporate industry cannot well be discussed here, but it is plain that such a system is not individualistic, and that the principles of management are such as government is familiar with, and might conceivably use with an efficiency proportioned to the excellence of its own organisation. In this respect corporate industry resembles socialism as well as in the further respect that competition and its attendant waste are frequently eliminated, though the benefit that might result has not always inured to society.

The existing industrial system is in many respects a mixture of socialism and individualism and is doubtless destined to remain so, though in what proportion the two will ultimately combine it is impossible to predict. No scheme of complete socialism has been proposed which provides at all adequately for the utilisation of human originality for the ends of progress, or appreciates the value to society of a leisured class. On the other hand it is alleged that the best individualistic systems have largely squandered and perverted originality and developed a leisured class which has not risen to the level of its duties. The modern tendency of society to limit individualism is doubtless due to deeper ethical considerations, the development of which is one of the most remarkable features of the day.

[Any standard work on political economy is an analysis of the individualistic system. Ely, *Outlines of Economics*, analyses the present mixed system as such. Mill discusses the difficulties of collective or state industry. The weakness of individualism is stated with great force by socialist writers, best of all perhaps in Edward Bellamy's socialist romance, *Looking Backward*. Defence and counter criticism are to be found in the works of opponents of socialism, *e.g.* Rae, *Contemporary Socialism*, and Graham, *Socialism new and old*.

INDORSEMENT. See BILL OF EXCHANGE.

INDUCTIVE METHOD. There is some ambiguity in the use of this expression. Sometimes it is used with reference to any inquiry in which results are arrived at by the study of concrete facts. The following passage from Prof. R. M. Smith, *Science Economic Discussion*, p. 111, illustrates this acceptation of the term. "Finally, we may ask, what can the inductive method do when it faces some great economic problem which affects the whole community and civilisation itself? Such a problem is the labour problem. What is the condition of the labouring class? Has that condition deteriorated or improved? The inductive method has not shrunk from attempting to find an answer to even such questions as these. Thorold Rogers has laboriously traced the condition of the English labourer during the last six centuries, for the

purpose of answering this question historically. Giffen has attempted, by statistics, to show that the condition of the labouring class has materially improved during the last fifty years." Dr. Keynes, on the other hand, objects to this use of the term (*Scope and Method of Political Economy*, p. 192, note) on the ground that "what is naturally understood by induction and the inductive method is a process of reasoning whereby, on the strength of particular instances, a general law is established." From this point of view, the instances given by Prof. Smith would rather be regarded as illustrating the statistical or realistic or concrete method of economic inquiry. It seems clear, however, that when an inductive method is spoken of it is not usually restricted to a method by which general laws are ascertained. Thus, Prof. Sidgwick says (*Scope and Method of Economic Science*, p. 33) that "even as regards the present condition of industry in the more advanced countries, to which the theory of modern economic science primarily relates, there is, I conceive, no dispute as to the need of what is called a 'realistic' or 'inductive' method—*i.e.* as to the need of accurately ascertaining particular facts when we are inquiring into the particular causes of particular values, or of the shares of particular economic classes at any given place and time." Here the inductive method is identified with the realistic, and is not conceived as necessarily concerned with the ascertainment of general laws, but only of particular causes at a particular place and time. The discussion of the correct use of the term induction must evidently be left to writers on inductive logic; but it may be permissible to remark here that Mill's influence has perhaps tended to narrow the use of the term in a way that is neither conformable to popular usage nor convenient for scientific purposes.[1] At any rate, when we speak of the inductive method with reference to political economy, it seems best to understand it as meaning any method by which truths of scientific value are obtained which are not directly deducible from principles already known. If the term is thus understood, Mill's inductive methods represent only a small part of inductive investigation; and the instances given by Profs. Sidgwick and Smith, so far as the results to which they refer are regarded as having scientific value, are correctly taken as illustrations of induction. It seems necessary to say that the results must have scientific value; for probably no one would regard mere economic history or mere statistics as illustrating the inductive method, or any other method, except in so far as they supply results that are capable of throwing light on economic tendencies. Even Mill would no doubt have been willing to describe the instances given by Prof. Smith as "subsidiary to induction"; and perhaps it is simplest to regard processes subsidiary to induction as being themselves inductive in their nature.

Assuming, then, that induction and deduction are to be understood in such a sense that between them they exhaust all the methods by which economic truths of any scientific value are ascertained, we have next to ask, What is the importance of the inductive method in economic research? This subject has been already to a considerable extent discussed in the article on DEDUCTIVE METHOD, and it is not necessary to add much to what is there said. The classical economists, led by Ricardo, are certainly chargeable with having comparatively neglected the inductive method. There are, however, some certain grounds on which their action may be defended. It may be said, on the one hand, that the facts to be dealt with by the economist are too complicated, and too little amenable to experimental treatment, to be suitable for the application of the inductive method. For this reason it may be urged that the observation of economic facts is seldom of any scientific value, except by way of verifying or correcting the results of deductive reasoning. This is no doubt largely true. A purely inductive investigation would be a long one; and the practical importance of some economic truths naturally renders us impatient of slow processes. Also, it is no doubt true that the economist has seldom the power of modifying his facts experimentally, so as to facilitate investigation. The importance of the latter point, however, may be exaggerated. The absence of experiment is partly compensated by the natural enterprise of human nature, on the one hand, and, on the other hand, by the possibility of forecasting results. The former fact gives rise to what is sometimes described as "unintentional experiment." This is perhaps an inaccurate expression;[1] but it is certainly true that the natural enterprise of human nature renders experiment less necessary in such a subject as economics than it is in the case of objects that are comparatively inert or that are difficult to observe under varying conditions. The power of placing ourselves imaginatively in different circumstances, and considering what the result would be,[2] is also a condition that renders actual experiment relatively unnecessary. It may be urged, however, on the other hand, that the latter circumstance

[1] It is probable that the somewhat narrow view which Mill took of the aim and scope of induction is largely responsible for his low estimate of the value of the inductive method in economics. See his *Essays on some Unsettled Questions of Political Economy*, Essay V., and *System of Logic*, bk. vi. ch. ix.

[1] See Keynes's *Scope and Method of Political Economy*, p. 169, note.

[2] This is what Cairnes describes (*Logical Method of Political Economy*, pp. 90-94) as "an inferior substitute" for experiment, or as "experiment conducted mentally." Cp. also Keynes's *Scope and Method of Political Economy*, p. 172, note.

to a great extent renders the inductive method itself unnecessary. "In order to know, *e.g.*," says Cairnes (*Logical Method of Political Economy*, p. 88), "why a farmer engages in the production of corn, why he cultivates his land up to a certain point, and why he does not cultivate it farther, it is not necessary that we should derive our knowledge from a series of generalisations proceeding upward from the statistics of corn and cultivation to the mental feelings which stimulate the farmer, on the one hand, and, on the other, to the physical qualities of the soil on which the productiveness of that industry depends. It is not necessary to do this—to resort to this circuitous process—for this reason, that we have, or may have if we choose to turn our attention to the subject, direct knowledge of those causes in our consciousness of what passes in our own minds, and in the information which our senses convey, or at least are capable of conveying, to us of external parts. Every one who embarks in any industrial pursuit is conscious of the motives which actuate him in doing so," etc. It is unnecessary, then, in such cases as these, to resort to the inductive method of inquiry, because the chief causes involved are known to us either by direct personal experience, or by sympathetic imagination, or by the instrumentality of language. But this is only partly true. In complicated cases it is difficult to disentangle motives—even our own,—and to estimate to what extent different considerations have weight in our conduct. And this is especially difficult when we have to compare the actions of men in different times and nations. In such cases an inductive method of investigation seems to be indispensable.

Summing up, then, we may describe the place of the inductive method in economics in this way. On the one hand, it is the method by which the premises of the deductive method are secured, and by which its results are verified. On the other hand, it is the method by which important facts are ascertained to which the deductive method cannot as yet be applied. The importance of carefully ascertaining the premises that ought to be adopted in deductive reasoning was very much overlooked by the earlier economists. They seemed frequently to get their premises out of the air without any preliminary investigation. Similarly, they tended to be rather remiss in the verification of their results. But perhaps their chief error lay in the tendency to overlook the importance of those elements in economic life to which the method of deductive inquiry is not at present applicable—*e.g.* to the study of consumption, and to the investigation of special economic forces,—as, for instance, that of custom—operative at particular times and places. Their errors in these respects have been well emphasised by the historical school. It is perhaps worth noting that Carlyle also, in his less scientific way, brought out the importance of inductive inquiry. In chap. ii. of his essay on "Chartism" he suggests a number of statistical inquiries with respect to the condition of the working classes, which would form the basis for a line of inductive investigations. It must be confessed, however, that inquiries of this kind have not as yet furnished us with much definite light either on economic tendencies or on methods of practical reform. But there is every reason to hope that they will be more fruitful in the future. And if the results of the deductive method have hitherto been more imposing, they have probably also been more misleading. The careful inquiries set on foot by such writers as Le PLAY or Mr. Charles Booth can hardly fail in the end to be both light-bearing and fruit-bearing. This is especially the case when such inquiries are conducted in accordance with the principles of the HISTORICAL METHOD. In economics, as in other sciences that deal with life, the genetic method combines, to a large extent, the advantages both of deduction and of induction.

[Further information with regard to the inductive method will be found in most systematic treatises on political economy, as well as in works on inductive logic.—Wagner's *Lehr- und Handbuch der politischen Oekonomie* is specially instructive (3rd edition, 1892, pp. 194-225).—Dilthey's *Einleitung in die Geisteswissenschaften* may be found suggestive.—Reference may also be made to the various works mentioned at the end of the article on DEDUCTIVE METHOD (see also HISTORICAL METHOD; STATISTICS, etc.).] J. S. M.

INDUSTRIAL COLONIES. The proposal to found industrial colonies owes its origin to two causes. *First*, the real or supposed existence of a class whose poverty or destitution results from want of employment, whether the cause of that want be incompetence, vice, the state of production, or overpopulation. *Secondly*, a tendency on the part of population to flock into the towns, swelling the numbers of the above class. Hence, the object of such colonies may be said to be twofold, to prevent unemployed labourers from drifting into a state of vagabondage, and to raise the vagabond class to industrious independence.

Historically, we find these causes playing a part in Greek colonisation, which was closely bound up in the population question, and in those Roman settlements which represent an attempt to solve the agrarian difficulty. In modern times several experiments have been made. In Holland the scheme of planting out the unemployed population of towns in the country dates from 1818, and has taken two forms. (1) The semi-penal colonies of Veenhuizen and Ommerschans, which are supported and controlled by the state, and to which vagrants are sent by order of the magistrate. (2) The colonies founded and maintained by charitable societies at Frederiksoord and

Willelmsoord, in which the destitute are trained in habits of industry by a carefully graduated system of charity and self-interest. In Germany, since 1882, charitable societies have adopted the system as a means of reclaiming the vagrant class by an opportunity of steady work and self-improvement. The introduction of the system into this country would be to carry out the spirit of the Elizabethan poor-law, which directed overseers to set the able-bodied poor to work. But to organise such employment has been found impossible. The parish farm, the "roundsman" system, were attempts to remedy destitution by "finding work," that is, by paying out of the rates for work which does not pay in itself. "Every device for relieving the poor by means of employment must prove illusory in the end, excepting where it is connected with the development of fresh resources for the remuneration of industry." The foundation of labour colonies by County Councils has (1906) been urged as a means of dealing with vagrancy; a departmental committee is investigating the question.

Midland), 1887. —*Methods of Employing the Unemployed* (Bd. of Trade, Labour Dept., 1893, for complete bibliography).—Mavor, *Labour Colonies*, 1892.—"General" W. Booth, *Darkest England Social Scheme*, 1892, for working of his farm colony.] L. R. P.

INDUSTRIAL COLONIES (BELGIUM). The present agricultural beneficent colonies of Belgium are the survivors of six state provincial *Dépôts de Mendicité* and two state-aided colonies of the private *Société de Bienfaisance* all existing in 1831. The two latter are extinct, and three of the former are closed. There remain—(1) a *dépôt* at Bruges for women and girls above eighteen; (2) an agricultural school at Reckheim for pauper lads aged fifteen to eighteen; and (3) the agricultural colony at Hoogstraeten, to which have been added the old Dutch colonies of Merxplas and Wortel, taken over by the Belgian government in 1870 at a cost of 800,000 francs (about £32,000).

The colonies are under the control of the department of justice. They comprise (*a*) a non-able-bodied colony, Hoogstraeten, extent 270 acres, accommodation 1300; (*b*) an able-bodied colony, Merxplas, 180 acres, accommodation 3600; and (*c*) working ground, Wortel, for the latter, 1410 acres. The total stock comprises about 40 horses, 320 cattle, 140 pigs, and 230 sheep. The area is thus allocated, viz.—arable and pasture 910 acres, heath 245, roads 320, buildings and gardens 74, with some fir-wood and uncultivated. The staff consists of 76 persons, besides farm-servants, master-millers, bakers, gardeners, and foremen, and about 140 soldiers. In October 1890 the total population, excluding staff, was 4000, of whom 2800 were able-bodied. The daily cost per head was about 65 centimes for an able-bodied, and 85 for an infirm person (about 6½d. and 8½d.). The inmates are all adult male vagrants and mendicants sentenced by police courts. They are classified according to ability and character, the classes being kept quite separate. The buildings were erected by colonist labour. The work comprises plaiting, spinning, metal lattice-work, embankment, scavenging, farm and garden work, forestry, brick and tile making, building, carpentry, joinery, etc., and necessary domestic labour. It is allotted according to classes. The colonists are allowed to earn money, of which two-thirds are paid to them on discharge: the earnings vary from 15 to 18 centimes *per diem* (about 1½d. to 1¾d.). It is a leading principle that all trades shall be encouraged, and many skilled tradesmen are among the staff. The presence of many good colonist workmen is accounted for by drink, according to the officials. The products of the work are partly taken by government and partly sold outside.

Recidivism is the rule: in December 1890, only 247 out of 4213 colonists were there for the first time. The general conduct is said to be good. The punishments are cells, or transfer to a lower class. The sanitation is good.

The labour of the colonists does not nearly pay for cost of maintenance. No precise accounts were, however, obtainable in 1890. The colonies appeared to be excellently managed: the question of cost and of reformatory success being the two chief points open to doubt.

[H. G. Willink, article in *Charity Organisation Review*, Jan. 1891, "Agric. Ben. Col. of Belgium." —George Nicholls, *Report on the Condition of the Labouring Classes, etc. in Holland and Belgium*, May, 1838.—Mavor, *Labour Colonies*, Board of Trade Labour Department; *Blue Book on Employment of Unemployed*, 1893]. H. G. W.

INDUSTRIAL COLONIES (GERMANY). The *Arbeiter Kolonie* has three distinctive features. It grew out of the conviction that for the treatment of the defective classes employment in the open air was advantageous. It was founded by a religious body as "a work of free compassion." It was established on the principle that work should be provided for the unemployed instead of other forms of relief. The farm or colony system had in 1834 been adopted by Dr. Wichern at the *Rauhe Haus*, Hamburg. This institution, originating in a home for boys, became afterwards a settlement of homes, including a training home for a brotherhood of men to be engaged in the work of practical charity. Out of this movement sprang the *Innere* Mission (1849). One of its branches was at Bielefeld, where in 1866 a colony for epileptics was opened. In 1872 Dr. von Bodelschwingh was placed in charge of this colony. In 1882 he applied the colony system to the problems of vagrancy and

bought an estate at Wilhelmsdorf near Bielefeld for the purpose of employing vagrants on the reclamation of the land. He argued that on this method half the cost of the vagrants' maintenance would be met, many would be deterred from vagrancy, a check would be put on indiscriminate almsgiving, and those who remained in the colony three or four months would learn the new trade of working on the land, and might "return to the life of a citizen." There are now 26 colonies, 3 Roman Catholic, the rest Protestant. Two are in towns; the rest are farm colonies. All are under the supervision of the *Centralvorstand deutscher Arbeiter-Kolonien*. In connection with them are lodging-houses (*Herbergen zur Heimat*) 426 in number, where the wayfarer or vagrant can obtain food and lodging at low rates; and, in many instances, relief stations (*Verpflegungsstationen*), where he can obtain relief in return for a task of work. Of these there are about 1900. These lodgings and stations are placed at intervals along the main routes. By German law vagrancy is a punishable offence. The wayfarer in self-justification may produce a way ticket (*Wanderschein*), which is checked as he passes from place to place, and by which he is obliged to travel according to a certain route. Arrived at the "colony" the police make inquiries about him. He is set to work. After fourteen days he receives, in addition to his maintenance, 2½d. to 3¼d. a day. If he wants clothes he is supplied with them. The price is stopped out of his wages, though he often leaves before his payments are complete. Any able-bodied man wishing to work is admitted. Habitual drunkards are excluded. Dismissal is the only form of punishment. The "colonies" were established and are supported by grants from state and local authorities and by subscriptions. Their produce is chiefly consumed within the colonies. On the statistics of the colonies the works of Dr. Berthold, the most important writer on the subject, give the fullest information. There are about 8000 persons admitted in the year. The vagrants in Germany have been estimated at 150,000. Of these more than half are in the prime of life, 25 to 45. About 79 per cent represent themselves as single. About 76 per cent have been in prison. About 44 per cent are unskilled or partially skilled labourers. About half have been in the "colonies" more than once. Many return to them frequently. In the winter the "colonies" are full to overflowing. In 1890 about 3500, in 1891 nearly 2000, were turned away. The pressure lasts during the winter. About 64 per cent leave of their own wish: about 19 per cent —a decreasing number—obtain situations. As to results: prosecutions for vagrancy have decreased from 23,093 (1880) to 13,583 (1890). The colonists are kindly treated and work fairly well. Employers are disinclined to take men from the "colonies." Many who find situations do not keep them. Better-class men think it a reproach to enter them. As a cure for these evils, Dr. Cronemeyer proposes a combination of the "industrial colonies" with "home colonies" (see below) for the industrious and reformatory, or penal colonies for those who require more strict supervision or punishment. Dr. von Bodelschwingh proposes (1) larger establishments in the towns to equalise the pressure; (2) a system of asylums for the incapable and crippled; (3) temporary colonies in bad years. Professor J. Mavor (Report, Labour Department of Board of Trade, C. 7182 (1893)) has dealt very carefully with the economic questions of the colonies. He says: "It is because the colonist is non-efficient that he does not compete with the labour market." But if this be so, a chief aim of the system, when established (see above), is not fulfilled. Next the supply of winter board and lodging should have the effect of reducing the relatively higher wages of unskilled labour in summer trades. Lastly, although the numbers concerned are relatively small, yet the minimum subsistence wage fixed by the colony for the purpose of inducing men to seek outside employment, may tend to some extent to become the maximum wage for low-grade labour in the district (p. 285). A home colony has been established at Bremerhaven. Colonists are there at first lodged in barracks, then in family cottages. There are twelve families. At this colony there is a considerable deficit, made good chiefly by voluntary contributions.

In the colony for epileptics at Bielefeld are about 1100 patients, under the care of Westphalian deaconesses and brotherhood. Adults and children are admitted, and may remain even when the epilepsy has terminated in imbecility or insanity. Admission is chiefly by payment on a graduated scale of charges. About 75 per cent of the patients are of the lower classes. They live in houses dotted about in the neighbourhood. Each house is under separate supervision, under the charge of a house father or mother. At different houses are different workshops. The colony with its church, etc., forms a society within itself. Expenditure about £31,000, of which about £1200 from patients' payments; the rest, grants from local authorities and contributions.

The test of a system for dealing with vagrancy is whether it assists those whom it relieves to return as soon as possible to self-supporting work in the open labour market. There is probably in all modern communities a substratum of vagrancy which cannot be removed. In times of industrial pressure this is increased by recruits from the ranks of inferior and usually unskilled workmen, who are the first to be discharged when fewer hands are employed. A good system would offer the minimum attraction to these to become permanent vagrants. There are two methods of

relief: (1) to employ and to endeavour to reform character or improve capacity; (2) to relieve under conditions of wholesome deterrence. The former is the German system. But the statistics do not seem to show that much is accomplished by way of reform. The latter is the English method; it makes no direct attempt to reform, but relies on the applicant preferring to gain his own livelihood to accepting relief on unattractive conditions. The result may be tested in two ways. Is the number of vagrants supported in winter large as compared with those supported in summer? If so, the system is used as a means of partial dependence by the habitual vagrant. Next, is vagrancy on the increase? In Germany the winter and summer number of the colonists varies widely. In England the winter and summer numbers of vagrants relieved by the poor-law vary comparatively little, except in a year of exceptional industrial pressure. Next the claimants for relief at the colonies increase yearly, though it may possibly be argued that the supply of necessary accommodation in Germany has not yet been brought to a level with the requirements, and hence a continual increase for the present may be expected. This contention apart—it would seem that the system draws the vagrant into dependence instead of preventing or reforming his vagrancy. In England, vagrancy seems to fall and rise quickly according to the industrial state of the country. If this be so, it is probably due in part to the fact that the German system is one of relief by employment, with no deterrent conditions. The work is taken as a payment for relief given. It is not laborious and yet it seems to justify the request for relief. A large number therefore take it without dislike or scruple. And as this process goes on, the better-class men become reluctant to apply; and the worse in a manner appropriate the institution to their own purposes. The latter part of this criticism may be applied to the English system; but now in many parts of England separate accommodation, with cleanliness, decency, and freedom from intercourse with others, is afforded to vagrants, so that the self-respecting man can, if he wishes, keep to himself.

[For other colonies in Germany and elsewhere see *The Epileptic and the Crippled* (Charity Organisation Series).—For bibliography, see Professor Mavor's *Report*, p. 431. C. S. L.

INDUSTRIAL COLONIES (Holland). There are two classes of colonies, the free colonies belonging to a charitable society, and the beggar colonies belonging to the state.

The original free colonies were founded in 1818 by a private society, *Maatschappij van Weldadigheid*, which was promoted by General van den Bosch, and was composed of a number of supporting districts, each entitled to have in the colonies as many families as it had contributed capital sums of 1700 guilders (say £140 each); and the district was liable for outfit, travelling, furniture, and incidental expenses. The idea of the founders of the society was that pauperism might, to a large extent, be prevented by providing agricultural training and employment for able-bodied, deserving, destitute persons.

By Dec. 1821, 121,000 guilders (say £10,000) had been thus collected, and 300,000 guilders (£25,000) borrowed: the number of buildings was 500; total population 2100. The colonies comprised about 3000 acres, chiefly heath-land, near Steenwijk, Drenthe, purchased at from 22s. to 30s. per acre. A quantity of land was afterwards bought at Wateren, but sold in 1859. The colonists were divided into 3 classes, viz. (*a*) families, (*b*) boarders, (*c*) orphans. Heads of families began as "labourers," with the prospect of rising to be "free farmers." Besides farming, the chief work was weaving, the products being sold to government. Colonists' earnings, over a certain sum, belonged to the society. In 1820 the society founded the beggar colony of Ommerschans in Overijssel, 1900 acres being granted by government; and soon afterwards another at Veenhuizen in Drenthe, 2380 acres being purchased. There were three main classes of colonists (*a*) persons committed for begging; (*b*) voluntary inmates; (*c*) old soldiers. By 1827 the population of Ommerschans and Veenhuizen together amounted to 4518, including officials.

The principal authority on the early history of both the free and beggar colonies is a report by Count Arrivabene embodied in a pamphlet by Nassau Senior, 1835. Mr. Senior himself considered failure inevitable.

During the next quarter of a century the colonies struggled on under increasing difficulties, caused partly by general bad management, partly by the hopeless insolvency of the beggar colonies. The society was repeatedly helped by the state, but matters grew worse until, in 1859, the government took over the beggar colony, excusing at the same time all moneys due to the state, and paying off also all the private debts of the society.

The authority for this period is Sir John M'Neill's report, 1853, in which he unreservedly condemns both kinds of colony, the free colony because it did not foster self-reliance, the beggar colony because of its expense.

Since 1859 the free colonies have been more

carefully managed, though the main lines are unchanged, and they have not much altered in size. Much of the land is now comprised in six large farms managed by the society—manufactures have been established, a forestry department has been organised. Colonists keep all their earnings; piece-work has largely supplemented time-work; and there are now more "free farmers" than "labourers." Still on an average not more than six fresh families are admitted annually; and the colonies are not self-supporting.

The beggar colonies have been gradually concentrated at Veenhuizen. In 1888 the population of Ommerschans was 400, with about 40 officials, and of Veenhuizen about 2020. Nine-tenths were persons under sentence for begging. The colonists are employed on agriculture and simple handicrafts. In 1886 only about one-third of all the expenses, amounting altogether to about 665,000 guilders (say £55,400), was met by the colonists' labour. Such labour is said to be very inefficient. The system is not deterrent, about two-thirds of the beggar inmates having been at the colony at least twice before.

For an account of both kinds of colony in the present day see Mr. Willink's articles written in 1888. He considers that the free colonies, good as their work may be, do not annually deal with enough fresh cases to furnish a solution of the problem of the indigent poor, however beneficial they may be to their limited number of inmates: and that the beggar colonies are not successful either as a deterrent, or from an economical point of view.

INDUSTRIAL EDUCATION IN ENGLAND is not, as in France, Germany, and other countries, entirely a government concern. Apart from the government science and art department which has its headquarters at S. Kensington and at the School of Mines in Jermyn Street, in connection with which evening classes and examinations are held throughout the country, industrial education in England is—quite characteristically—almost entirely promoted by charitable endowment and by local or private enterprise. By far the most important and recognised factor in its promotion is the City and Gilds of London Institute which not only provides, but subsidises other establishments which are providing, sound technical instruction, and encourages in the principal industrial centres of Great Britain the formation of evening classes for workmen and foremen. The Clothworkers' Company are also working in the same direction, and the other great livery companies of London are being pressed to expend a portion of their wealth in furthering the same object.

The universities of Oxford and Cambridge, London and Manchester, and the university Colleges of London and elsewhere, are giving great attention to science and art as applied to industry. But what is even more important, the county councils and municipal councils of the country are taking up the matter with a keen interest.

Elementary technical education both for girls and boys has now for many years been introduced into the curriculum of the elementary day school. Evening classes, usually in connection with the government science and art department, are held; and continuation schools are being provided in the higher-grade schools instituted in the larger industrial centres. The royal commissioners in their report of 1885 on technical education, deplore that England is singularly lacking in continuation schools of this kind; but an effort is being made to supply this want, especially in Manchester and other industrial centres.

Bristol and Birmingham are paying great attention to the subject of primary and secondary technical education. In Liverpool the late school board, by the introduction of elementary technical instruction, attempted to connect the primary with the secondary schools. In Manchester, besides the higher-grade schools before mentioned, there are several technical schools for artisans. Oldham has a school of science and art with evening classes adapted for the technical instruction of young men engaged in the various mechanical and textile works of the neighbourhood, particularly machine construction and the manufacture of cotton.

Of secondary technical schools and colleges the most important and best endowed is the Finsbury Technical College, established in 1883 by the City and Gilds of London Institute, as a model trade school for instructing artisans. Only second to this are Firth College, Sheffield, and University College, Nottingham; which both receive grants from the Institute. These colleges are furnished with workshops and laboratories and possess every appliance for the illustration and application of industrial methods in carpentry, building, engineering, chemistry, dyeing, art designing, carriage

building, metal plate work, and many other branches of trade and industry.

In special weaving and dyeing schools the commissioners found England very deficient as compared with France and Germany, but they bestowed unqualified praise on the Yorkshire weaving schools of Leeds, Bradford, and Keighley, all which are largely supported by grants from the Clothworkers' Company. The Leeds school was erected by the company at a cost of £15,000. There is also a fine weaving school at Glasgow.

Many other institutions, such as the London Polytechnic, the Royal Engineering College at Cooper's Hill, the Royal Naval College, Greenwich—especially adapted for the study of shipbuilding—and the Crystal Palace School of practical engineering—exist, where instruction is given in every branch of trade and industry.

As specimens of private voluntary enterprise in this direction mention must be made of Messrs. Mather and Platt's workshop school at Salford, maintained at their own charge for the technical education of their own workers. At Cambridge the commissioners were particularly struck by the mechanical workshops, instituted by Professor J. Stuart, to enable the sons of manufacturers and others to combine with university training instruction of a kind immediately practicable to their calling. The special feature of the Allan Glen's Institution at Glasgow is workshop instruction. Ireland appears to be somewhat deficient in evening classes for artisans, but in the reformatory and industrial schools of the religious brotherhoods and sisterhoods, boys are instructed in a variety of trades, and in every department of farming and gardening. Also many of the Irish national schools have school-farms attached. In addition to this, the Grocers' Company support a school of agriculture at Templemole; there is also the Albert National Agricultural Training Institution at Glasnevin, with three farms attached, and there is the Munster Dairy School.

Ireland is more advanced in this branch of instruction than England. The English government, except by the S. Kensington examinations, has done little or nothing to promote agricultural education. The few schools that exist are self-supporting. The Royal Agricultural Society of England, and the Highland and Agricultural Society of Scotland, encourage this branch of study by acting as examining bodies. The Scottish society makes a special branch of forestry, with drainage, fencing, bridge building, and the chemical knowledge of soil properties.

Among the agricultural establishments in England, the Royal Agricultural College of Cirencester, organised by the Farmers' Club, holds the first place. The college farm consists of 500 acres devoted to arable, pasture, and dairy farming; and it also possesses botanic gardens. Excursions are made by senior students to the neighbouring farms and herds. In 1880 the Downton Agricultural College, Wilts, was opened on somewhat similar lines.

Agriculture is also included in the curriculum of the county schools. Some years ago an attempt to open a British Dairy School failed, but the effort is illustrative of a felt want of some such institution.

Perhaps the most interesting and instructive institution for the analytic and scientific study of farming and agriculture is the private experimental station at Rothamsted, established by Sir J. B. Lawes. Minute investigations and comparisons of soils, manures, crops, and pasture are made. Experiments in stock feeding and stock breeding are carried on upon a most extensive and elaborate scale.

In conclusion the commissioners found that although the British government has almost entirely neglected the technical education of agriculturists, it has made an effort by its examinations to spread a book knowledge of agriculture.

[*Report of the Royal Commission on Technical Education*, 1885.] A. L.

INDUSTRIAL EDUCATION IN THE UNITED STATES. Education with special reference to the economic life of the people is being promoted in the United States in three different ways: (1) A general introduction of what is termed manual training in the public school system of the large cities; (2) in the establishment of trade schools; (3) in the founding and endowment of higher technical schools and colleges which include a specialised education for the direction of manufacturing, mining, and agricultural industries. With regard to the first experiment, manual training, it is to be observed that it is not artisan education. It "signifies instruction in tool work as an educational discipline." This training, if grafted upon the public school system, is generally taken in connection with the high school studies, and consists in exercises in drawing, modelling, and wood-working, with sewing and cooking for girls. In some of the larger schools which have private endowments, as at Chicago and St. Louis, the course of study embraces pattern-making, foundry-work, forging, and machine shop-work. Manual training as an educational method is largely the growth of the past ten years. There is no uniformity in these schools in the different parts of the country, and some of them are so far developed that they may be regarded as "schools of apprenticeship, though the brief courses pursued in them seem wholly inadequate for the mastery of any trade."

Of the trade schools, there are as yet but few. The best known and most successful is that

established by Col. Auchmuty at New York. Here instruction for fees is given in bricklaying, plastering, plumbing, carpentry, house, sign, and fresco painting, stone-cutting, blacksmithing, tailoring, and printing. A few large manufacturing establishments and railroads have specialised schools for instruction in particular artisan work; and training of this character is being incorporated into the discipline of the better reformatory institutions for youth and men, as at the Elmira Reformatory. All these distinctively serve as apprenticeship schools.

Institutions of the third class include—(*a*) agricultural colleges founded since 1860, for the most part under endowments of the national government, and generally attached to a state university for its administration; and (*b*) institutes of technology for the special education of engineers, architects, and chemists. Colleges and state universities have also very generally introduced similar training into their curricula.

[See *Eighth Annual Report of the United States Commissioner of Labour, 1892.—Industrial Education*, Washington, 1893, pp. 707. This contains a valuable bibliography of twenty pages, relating to the subject of technical training in the United States and Europe.] D. R. D.

INDUSTRIAL PARTNERSHIP. This term is generally used of a system of industry under which the employer is so far in partnership with the employed that he accords to them a share in the profits which are realised (see PROFIT-SHARING). It has been more widely adopted abroad than in England, and it has there been applied to a variety of industries. The term is sometimes also employed of a system by which the actual workmen take upon themselves all the responsibilities of management, and endeavour to eliminate the employer entirely, and secure for their own advantage the whole of his profits. But this latter system is more usually called co-operative production (see CO-OPERATION) and the term "industrial partnership" confined to the system which was first mentioned. This system possesses advantages over that of co-operative production, because the workmen enjoy the benefit of a share in the profits, and the stimulus of an interest in the success of the undertaking, without ceasing to avail themselves of the advantage of the experienced and interested management of the employer (see EMPLOYERS AND EMPLOYED). It has been asserted that the system leads to an increase in wages by the addition of the share of profits which is distributed without occasioning any encroachment on the gains of the employer. It has been affirmed that this is the case because the workmen are rendered more careful in the avoidance of waste, are less disposed to listlessness or idleness, and require less constant and watchful superintendence. The system has been applied with three main varieties of method. The share of profits is sometimes given wholly in cash, sometimes it is set aside or invested in order to secure a provision for the old age or sickness or death of the workman, and sometimes it is treated partly in the first, and partly in the second manner. The difficulties of adopting and working the system may be said to consist partly in the possible inconvenience of a wish on the part of the men to interfere in the details of management, partly in their probable disinclination to share in losses as well as in profits, and partly in the absence in some trades of an opportunity for making a fresh addition to profits through the avoidance of waste or of idleness. Its advantages are summed up in the feeling of joint interest in the success of the concern which it tends to create between masters and men. The system is perhaps best known in connection with the successful trial of it made by the Parisian house-painter, M. LECLAIRE (*q.v.*).

[The system of profit-sharing, or industrial partnership, is thoroughly examined, and the instances of its application recorded and investigated in detail, in N. P. Gilman's *Profit Sharing between Employer and Employee*. A shorter account is given in Sedley Taylor's *Profit Sharing;* and notices of the system are contained in Babbage's *Economy of Machinery and Manufactures*, under the heading "A new system of manufacture"; in J. S. Mill's *Political Economy*, bk. iv. ch. vii. § 5; Fawcett's *Manual of Political Economy*, bk. ii. ch. x.; Jevons, *State in Relation to Labour*, ch. vi., and *Methods of Social Reform*, p. 122; and Cairnes's *Essays in Political Economy*, No. v.; cp. Robert, *La Participation aux bénéfices*; also Schloss, *Methods of Industrial Remuneration;* and B. Potter, *The Co-operative Movement*, for criticism of the system (see CITÉ OUVRIÈRE; FAMILISTÈRE; GODIN).] L. L. P.

INDUSTRIAL RÉGIME is a phrase which only now appears to be in process of crystallisation into a definite use in economic language: and we can hardly define it satisfactorily without sketching the history of the term so far as we can trace it. In 1821 St. Simon wrote his treatise *Du système industriel:* he did not, so far as we can discover, use the phrase under discussion; but he and his followers used *l'industrialisme* to indicate at one time generally the modern industrial organisation, at another time the particular industrial organisation which they advocated. Probably through Comte the idea passed into the works of Herbert Spencer, who distinctly opposes modern "industrialism" to mediæval "militarism," and uses the phrase "militant régime" but not its implied opposite (*Data of Ethics*, ch. viii., etc.).

Apparently the actual phrase is quite modern, and Sir R. Giffen seems to have been one of the first who adopted it; he includes, under the general term "industrial régime," all those

phenomena which go to make up the economic stage: in other words, "the sum of the chief features in the industrial organisation of a country like England." But the particular organisation of industry in England differs not merely in degree, but to some extent also in kind, from that of many other civilised communities; and this fact leaves the meaning above attached to the phrase indefinite. Out of this arises an application of the term "industrial régime" to particular forms of industrial organisation—*e.g.* competition as opposed to socialism — the system of large tenures as opposed to peasant properties. Here the term becomes even more vague. We should hesitate to deny to the most strictly socialistic régime the title to be called industrial, especially when the phrase now in question had its birth in a communistic writing.

Clearly the simplest signification to affix to it would be that of the industrial organisation of any country, however rude, as opposed to mere nomad and marauding existence. In this case the industrial régime of any country will be the sum of its industrial features, and will vary with the state of economic development. C. A. H.

INDUSTRIAL REVOLUTION, THE. At the close of the 18th, and the opening of the 19th century a change, or rather a series of changes, passed over the agricultural and manufacturing industry of England, which has been aptly described by the name of the Industrial Revolution. The changes which then took place were of considerable magnitude, and the conditions of industry, both in manufactures and in agriculture, may without any great extravagance be said to have been revolutionised. Until this time the general character of industry in England presented broadly the same features as those which it had exhibited during the greater part of the middle ages; and from that time the commencement of our modern system of industry dates. AGRICULTURE IN ENGLAND (*q.v.*) and manufactures alike were then generally prosecuted on what we should term primitive and unsystematic methods. Men were raising complaints that half the land of the country was waste. The size of the farms was small, and the method of cultivation unscientific. In many parts of the country there were still open unenclosed fields; in nearly all there was an absence of any proper system of rotation of crops, and of turnips and artificial grasses. Quarrels were continually arising about the rights of pasture on the common meadows, and about the boundaries of the many scattered minute parcels of land of which an individual's holding was made up.

Nor was the position, or character, of manufacturing industry different. It was carried on, with few exceptions, by craftsmen working with their own hands in their own homes (see DOMESTIC SYSTEM OF INDUSTRY), although even then there were exceptions, for some capitalist employers existed, and some factories had been built by the middle of the eighteenth century. The mechanical appliances and tools which the craftsmen used were generally of a simple and rude description, and the number of persons working under their direction was small. The apprentices (see APPRENTICESHIP), limited in number and term of service, and the JOURNEYMEN (*q.v.*), with their wages fixed, in theory if not in practice, by the magistrates, lived in the house, and ate at the table, of the master-craftsman. Employment, such as it was, was regular; fashions varied slowly and slightly; and men produced in the main, though not exclusively, for a market which was close at hand. They were intimately acquainted with the conditions of that market, and the state of the roads was such that intercourse and trade with distant towns were rendered difficult. The workman who ventured to move from one town to another was not merely liable to be sent back to his original abode under the law of settlement (see SETTLEMENT; POOR LAW), stigmatised by Adam Smith (*Wealth of Nations*, bk. i. ch. x.) as an "evident violation of natural liberty and justice," for fear that he might eventually come upon the rates in his new dwelling-place, but he might also be excluded from employment by the restrictive privileges of some exclusive trade corporation which were, in Adam Smith's words, a "plain violation" of that "most sacred and inviolable property which every man has in his own labour." The goods which the craftsmen made were often taken to the halls of the different corporations to be stamped as genuine. The woollen industry was now, as it had been for a long time previously, the staple industry of the country, and was carried on at Norwich, and in the west of England, and the west Riding of Yorkshire. The iron industry, which was prosecuted in Sussex, where the iron was still smelted by charcoal in small furnaces blown by leathern bellows worked by oxen, was said to be gradually dying out; and the cotton industry was so insignificant as to be mentioned but incidentally, by Adam Smith, who lived on the very eve of the industrial revolution, and himself, perhaps, assisted in affording a shelter within the walls of Glasgow University to James Watt, the inventor of the steam-engine, seeking protection from the exclusive tyranny of the local corporation of hammermen, who had refused to allow him to practise his trade. Adam Smith declared that there had been only three inventions of note in the cotton industry for the space of three centuries. Banking was as yet in its infancy, and the Bank of England did not issue notes of a lower denomination than £20. The external commerce of the country was hampered by a number of vexatious restrictions, and duties on imports and

bounties on exports abounded, while the colonies were regarded as a field for the commercial monopoly of the mother country. Such was the general condition of affairs before the changes which introduced the modern industrial system. Those changes were bewildering in their magnitude, and, to some extent also, in the rapidity with which they were effected. Agriculture underwent a transformation, the chief part of which, however, seems to have been accomplished in the earlier half or two-thirds of the 18th century. Large farms began to take the place of small farms. The inclosure of the open field was actively prosecuted, and sometimes injustice was done to the rights of the smaller commoners. Scientific cultivation was substituted, in a more or less considerable degree, in different parts of the country, for primitive methods. Bakewell improved the breed of cattle. Townshend—"Turnip Townshend" as he was nicknamed—introduced the cultivation of turnips. Coke at a later time devised an improved system of rotation of crops. But in manufacturing industry the changes were more revolutionary, and they occurred in the latter part of the century. Four great inventions were made in the cotton industry—that of the spinning-jenny by Hargreaves; that of the water-frame by Arkwright; that of the mule by Crompton; and, the most considerable and important, in its consequences to the old handicraft occupations, of all, that of the power-loom by Cartwright. This last invention dealt a fatal blow to the fortunes of the old hand-loom weavers, and their distress has furnished a stock illustration of the temporary misery which may be occasioned by the introduction of machinery, at any rate to those workmen the labour of whose hands it supersedes. But other industries besides that of the manufacture of cotton were affected by the changes of the times. The smelting of iron by coal was introduced by Roebuck, and the decaying iron industry revived, and abandoned the charcoal forests of Sussex for the coal seams of the north and the Midlands. Canals, such as the Grand Trunk connecting the Trent with the Mersey, and the Grand Junction, which afforded the means of communication between London and the chief towns of the Midlands, were constructed under the direction of the inventive genius of Brindley, and the roads of the country were improved under that of Telford. Mills were erected on the banks of rivers in order that use might be made of the water-power which was there available to drive the new machinery, and then came the most wonderful and important discovery of all—that of the steam-engine, to be followed in its turn by the railway. All these changes gave a great stimulus to the production of wealth and the growth of population. They kindled a spirit of eager and restless enterprise, which was sometimes inclined to be reckless of injury occasioned to human life and health, and to give little consideration to the wrench to human affections which was not infrequently the consequence, direct or indirect, of the changes. For trade passed from quiet villages to noisy towns; from the home of the handicraftsman to the factory of the employer; from the master, who lived together with his apprentices and journeymen, and was in general "so joined together" with them in "sentiment" and "love that they did not wish to be separated if they could help it," to the employer who had hundreds of "hands" working under him, whose very faces he might not himself know. Division and subdivision of labour (see DIVISION OF LABOUR), organisation and localisation of industry, were carried out on a scale, and to an extent, unknown before. Master-merchants and wholesale dealers arose. Manufacturers began to produce for distant and fluctuating markets, and to crowd into, and dismiss from, their factories, as the changing demands of varying trade required, multitudes of men, women, and children. There seems to be reason for believing that something like a regular system of transporting children from London to the new manufacturing districts of the country was in operation; and there is unfortunately no doubt that the greed of parents joined with the eagerness of employers to increase the number and intensify the labour of the young apprentices in the factories. Population was stimulated by the lax administration of the poor law, and by the numerous chances of earning a livelihood which presented themselves; and was, so to say, torn up by the roots from its old abodes, while the industrial world was pervaded by restless movement. The workmen were forbidden by law to combine with a view to the regulation of trade, but, under the guise of friendly societies, they formed themselves into TRADES UNIONS (*q.v.*), and attempted in certain trades to restore the old system, by which the number of apprentices was limited, and the magistrates determined the rates of wages. They failed ultimately in this endeavour; but they did not cease to maintain, under circumstances of difficulty, their unions; and the state, by its FACTORY ACTS (*q.v.*), placed restrictions of increasing rigour and comprehensiveness on the employment of women and children. The industrial revolution was undoubtedly a time of great distress, which may have been increased by the CORN LAWS (*q.v.*) preventing the importation of food from abroad to make up for the scarcity occasioned by bad harvests at home, and by the depression of trade which followed the close of the great war. The financial demands of the war combined with the opportunity afforded to England to supply the commercial wants of the continental nations, in whose country, and by whose soldiers the war was chiefly prosecuted, to stimulate increased

production; and the brilliant series of inventions which were made towards the close of the last century, permitted the stimulus to be effective. The pressing need of the time seemed to be that of increased production; and the nation was less inclined to regard those permanent interests, which might have been consulted by greater consideration for the health and the education of the young, than to promote the obvious and immediate interests of the moment. The industrial revolution may be said to cover the period embraced by the writings of the three great older economists, ADAM SMITH, MALTHUS, and RICARDO (*q.v.*). The first lived on the eve of the revolution, amid the relics of the routine and regulation of a former era. The second lived in the midst of the revolution, and his writing reflected the gloom and despair of the time. The third lived towards the end of the revolution, and the assumption of a pervading competition, which is the basis of his reasoning, was not a wholly inaccurate representation of the actual state of affairs.

[For an account of the industrial revolution the student should consult Toynbee's *Industrial Revolution*, Miss Martineau's *History of the Peace*, and, for the evils of the old factory system, Karl Marx's *Capital*, which is, however, obviously biassed.—For the struggle of the old trade unions, Brentano on *Gilds*, and Howell's *Conflicts of Capital and Labour*, are of use; and, for an account of the changes in agriculture, reference should be made to Prothero's *Pioneers and Progress of English Farming*, ch. iv.—Held, *Sociale Geschichte Englands.*—For much general information, Tooke and Newmarch, *History of Prices*, 6 vols.; cp. also W. Cooke Taylor on the *Modern Factory System.*—S. and B. Webb on *The History of Trade-Unionism.*] L. L. P.

INDUSTRIES, LARGE AND SMALL. One of the most marked tendencies of modern times in industrial matters is to increase the scale on which commerce and manufacture are conducted. The DOMESTIC SYSTEM OF INDUSTRY (*q.v.*) has given place to the FACTORY SYSTEM (*q.v.*); smaller factories have made way for larger establishments which really comprise several factories beneath one roof—for not merely are there separate rooms devoted to distinct operations, but there are sets of rooms so devoted—private ventures have been superseded by public COMPANIES (*q.v.*) controlling greater masses of capital, and employing greater numbers of workers; and various SYNDICATES (*q.v.*) and TRUSTS (*q.v.*) and other kinds of combinations have been formed. The use of steam as a motive power has probably contributed to this tendency to concentration of industry in large establishments, for it can only be generated in one spot and distributed over a small area. But there are other advantages possessed by the system of production on a large over that on a small scale, which have assisted the movement, and these would not cease to be operative, were steam replaced by some fresh motive power, such as electricity, which could be generated at a common centre and distributed by wires over a comparatively large area. These advantages may be classified under three heads: (1) *Economies of management.*—A large undertaking permits of a more systematic organisation, and a more thorough application of the principle of the DIVISION OF LABOUR (*q.v.*). It allows of a better arrangement of buildings and of mechanical appliances. It affords the opportunity for the experimental trial of new machinery, to the expense of which a smaller undertaking would be unequal. In all these ways it tends to economy, and in other ways also it effects a direct saving. "One high chimney can make a draught for a large furnace as well as for a small one; one doorkeeper can admit five hundred men as easily as fifty." The different clerks, stokers, and mechanics can be kept more fully employed on their own special work in a large than in a small undertaking; and the employer at the head of a large establishment is able to devote his time and his thoughts more exclusively to the general direction and superintendence of the business. (2) *Economies of purchase.*—A large undertaking can generally buy what it requires on more advantageous terms than those enjoyed by a smaller undertaking. It can employ well-paid and trustworthy agents. It can draw its supplies from a wider area. It can obtain greater facilities for transport. It can buy in larger quantities, and can afford experimental purchases of machinery and materials. (3) *Economies of sale.*—Somewhat similar advantages belong to the larger undertaking in the matter of selling as in that of buying. It can push its wares by advertising and employing commercial travellers. It can secure the cheaper and more expeditious and efficient transport of these wares to their ultimate destination. It can ascertain the condition of remote markets. It can offer a more abundant variety of patterns and styles. It can perhaps inspire greater confidence in its customers. The advantages thus possessed by large over small undertakings are very great; and to them must be added the consideration that there are some enterprises the magnitude of which is such that they could not be successfully accomplished without the resources of capital commanded by a large trading company. The system of limited liability (see LIMITED LIABILITY ACTS) has permitted of the formation of these companies with comparative ease; and Professor Marshall has said (*Economics of Industry*, original edition, bk. i. ch. viii.) that "there does not seem to be any limit to the amount of wealth which a single trading company can profitably manage in a business which can be managed by routine, and does not require the bold enterprise and prompt decision of a

single mind." But there are, on the other hand, advantages which belong to small, and are not possessed by large, undertakings; and there are departments of industrial activity to which the system of production on a large scale has as yet been applied only in exceptional cases. Smaller subsidiary industries are continually springing up to supply some of the wants of the larger; and AGRICULTURE (*q.v.*) is, at present at any rate, following at a gradual pace in the steps of manufacture. The introduction of mechanical appliances is indeed advancing, and the larger farmer may possess an advantage over the smaller in the matter of the economical use of these appliances, and of his farm-buildings and materials and implements. He may, too, possess greater scientific knowledge, he may display more vigorous enterprise, he may command more abundant capital, and adopt a better rotation of crops. But, with all these unquestionable advantages, it is still the case that agriculture permits of less systematic organisation than manufacture, and of a less thorough application of the principle of the division of labour. The labourers must be scattered over the country, and they cannot be concentrated in masses as they are in the manufacturing centres. Their work varies with the seasons, and they cannot devote their entire energies to some small department of a great industry. And, again, the business of superintendence, and the advantage of unremitting personal watchfulness and close personal interest, are more obvious and important in agriculture than they are in most branches of manufacture. It is in this matter of superintendence and of personal interest that the small master enjoys a superiority over the large, and that the private venturer has a resource and a stimulus which can hardly be possessed, and are rarely exhibited, by the salaried officials of a public company. In industries, then, which demand the incessant vigilance of personal interest, and do not possess a market large enough to render profitable the thorough application of the principle of the division of labour, the system of production on a small scale has, even in manufacture, advantages over production on a large scale (see EMPLOYERS AND EMPLOYED).

[J. S. Mill, *Political Economy*, bk. i. ch. ix., and Marshall's *Principles of Economics*, bk. iv. ch. xi.] L. L. P.

INDUSTRY, CAPTAINS OF. This title has been sometimes given to the employers of modern industry. They have been regarded as the leaders of an industrial army, which is under their command, obeys their orders, and depends to a very large extent for success or failure on their judgment and enterprise. They have in a sense to determine on the plan of action, to organise its means, and to superintend its execution. The employer of older times was a craftsman who lived and worked together with a small number of apprentices and journeymen (see DOMESTIC SYSTEM OF INDUSTRY), and produced his goods, frequently to order, and generally for a steady unchanging market close at hand. Now production is carried on in anticipation of demand, goods are made according to varying fashions of divers materials brought from remote countries, and they are sold at a distance from their place of production and often on credit. The scale on which business is habitually conducted has largely increased (see TRADE), and the number of persons working under an employer has grown together with the size of his factory. The difficulty and importance of the labour of management have undergone a corresponding extension, and the employer has become the most prominent and responsible personage in the world of industry. His authority is despotic, and his power for good or for evil immense. And, just as an army follows the directions, and depends on the generalship, of the commander, so the industrial army obeys the orders and relies on the ability and discretion of the employer, the captain of industry. It is this idea of leadership which has suggested the metaphor, together with the conception of the modern world of industry as the scene of the eager unceasing competition of rival armies of producers.

[For the function of the employer the books mentioned in the articles on EMPLOYERS AND EMPLOYED; EMPLOYING CLASS; and ENTREPRENEUR, should be consulted.] L. L. P.

INDUSTRY, ORGANISATION OF. The organisation of industry, unlike most forms of organisation outside the purely physical world, is not in any great measure due to the conscious endeavour of individuals; it rather grows out of the acts of people for their own ends. It thus contrasts with the organisation of labour (see TRADES UNIONS), and any other combination of the same class (as FARMERS' ORGANISATIONS, U.S., *q.v.*); for such organisations are deliberately formed for special purposes,—generally the defence of classes, interests, or industries,—and have definite aims in view. It is claimed by socialists and collectivists that under a socialist régime this organisation would be carried on with a particular aim—the development of the talent and energy of the whole community; that it would be controlled and regulated by the wisdom of the great body of the people; and that it would, therefore, apart from the special economic effects in distribution of wealth and labour, be more successful than it is at present, when it is dependent on the interests or caprices of individuals. On the other hand, it is maintained that under a system of individual freedom the energies of each are, by force of nature, driven into those channels in which they will be of most use; and that the machinery by which industry has come to be

regulated, though not the result of a definite scheme, is the consequence of principles of human nature which must always in the long run produce the most satisfactory organisation for the community, because ability and capacity are attracted to their proper channels. Whatever view is taken, it is certain that without organisation of one kind or another industry would now be useless and impossible; and the existing organisation is so deeply rooted that it would be difficult to do more than amend it in detail. It is part of the industrial life of every civilised nation.

The earliest phase, historically, of this organisation is what is called division of employments; and the earliest division of employments, like the origin of capital, is lost in the past. We find in some of the oldest records, however, that people are mentioned as engaged in certain specified employments. In the Pentateuch artificers in brass are named; and dyeing and weaving we read about as recognised occupations. There was also, at a very early period, a division between rural and urban forms of industry. The dynasty of Pharaohs, who befriended the Israelites, are understood to have been a race of shepherd princes or chiefs who were ultimately driven out by the later dynasty who held the kingdom in the time of Moses. The curious episode of the purchase and storage of grain by Joseph could only have occurred in a state of society where the town and the country had diverse industries and interests. The progress of industry among the Greeks and the Romans is not easy to trace: that the division of employments attained to a greater degree among them than with the eastern races is certain, but further than this it cannot be said that any organisation is traceable.[1] The division of employments was also retarded greatly by the use of slaves. The localisation of industry, with which we are now so familiar, is found only in its earliest form, where absolutely necessary;—as where precious metals were discovered, or a natural harbour existed, and a port created to serve the surrounding country. What in modern times forms one of the most important features in the organisation of industry—the massing the people engaged in the same employment or manufacture together in certain towns and districts, apart from natural or geographical causes, is a much later development. This phenomenon in the progress of industry is far more common in the present century than it has ever been before; it is, in fact, one of the predominant characteristics of the age we live in, though it is still capable of further development, if the same forces that have acted in the past continue to act in the future. This great change is the result of the new physical forces which have come into operation; steam, electricity, and rapid means of carriage and communication.

In mediæval times, the organisation of industry was attempted to be carried out on a set plan in a far greater degree than in modern times. The whole series of associations, international, national, and local—as the HANSE towns, the STAPLE towns, the merchant and craft GILDS—were attempts made to organise industry through combination for the benefit of the whole association, and through it of each individual member. The unions in separate trades, existing when the means of communication was poor, and distance in space an almost insuperable barrier to the promotion of common interests, frequently caused a subsidiary localisation to take place, the remains of which are seen in the nomenclature of certain districts and streets in the large towns. In the city of London, the names of some streets still indicate the occupations of former occupiers. Prof. Ashley (*Economic History and Theory*, vol. i. p. 96) gives instances which could be multiplied readily in almost every city of considerable size and antiquity.

These localisations were not the result of the convenience to an individual of being in the neighbourhood of those in his own trade, an object which we are used now to see attracting men, but were part of a determined effort to produce an offensive and defensive union for the preservation and furtherance of class interests. If the trade was threatened, either by imposts of the government or by foreign competition, from other towns usually, or by defections from its own ranks, it was necessary to act in unison; and to do this, the trade must be capable of being called together at the shortest notice. Again, if any member was threatened with injustice as an individual, it was important that all the trade should be ready to defend him, if need be, without delay. It is probable that this congregation of trades led by gradual steps to the modern form of grouping, by which industries become localised. In a great number of instances an industry becomes fixed in certain localities by some geographical or geological advantage. The mouth of a large river is naturally used for dock-yards and ship-building; the more easily coal can be conveyed, the more likelihood is there that such a trade will flourish. Of course the presence of coal-fields fixes the locality of a mining industry; and the neighbourhood of coal-fields assists in the rise of industries which constantly require a great quantity of fuel, such as iron and steel manufacture. In a greater number of cases, however, there is no determining cause of the kind we have mentioned, and the prevalence of a trade in any particular town or district is probably due to the indi-

[1] (See *Manufacturing Arts in Ancient Times*, by James Napier, London, 1874, for an interesting account of early localised industries.)

vidual enterprise of some one man. In this country, as in others, we have many examples of such apparently haphazard localisation. There is no reason in nature why china should be made in Dresden; nor why glass-blowing should be predominant in Venice, and carpet-making in Brussels. The lace manufacture in Nottingham, the former silk industry at Coventry, the shoe trade of Northampton, are all familiar instances of the same phenomenon. The origin of these particular local trades and others like them is interesting, but of no scientific value. What is of importance about them is the consequence that we have capital of the same class and labour of the same kind drawn together, with the result that the former, even where it is fixed or specialised, becomes more transferable and easier to realise, while the latter loses much of its natural immobility. The general wage in a trade is much more accurately known where the trade is largely confined to one district than where it is scattered over the country; and thus the remuneration of agricultural labourers, who belong to a trade in which localisation is impossible and organisation singularly difficult to obtain, has always exhibited a very marked divergence in different parts of the country, while the wages of coal-miners remain approximately the same in all different coalfields. From year to year the farm-labourer in Wiltshire goes on taking 30 per cent lower wages than the man who is doing the same kind of work in Yorkshire; but if a rise in wages is obtained by miners in one district, even of a small amount, those in the other districts immediately endeavour, through their unions,—and often successfully,—to obtain a like advance in their own rates.

The features of the modern organisation of industry which are the most striking and the most important are the specialisation of capital and of labour, and the interdependence of trades. The occurrence of these phenomena have, no doubt, led many thinkers of this century to discuss the question whether, when one group of labourers or capitalists depends so greatly on others over which they have no direct control, it is not possible and advisable to place the whole industry of the nation under some central authority; so that, as socialists say, it may be guided by reason for the common benefit, instead of by chance and caprice for the advantage of certain individuals. The cause of this mutual dependence is really, in one or other of its many forms, the tendency which Adam Smith named the DIVISION OF LABOUR. If we take any manufactured article, not of an elementary kind, we find that a perfect multitude of people have combined to produce it and bring it into the market where we find it; often the difficulty, in fact, is to find some class of labourers who have not had a hand in the business. Take such a commonplace thing as a lead-pencil, costing a penny. In the making it, of course, the miners who dug the metal and the hewers who cut the cedar have been employed, besides the workers in the pencil factory who cut each into its proper shape. Then there are the men who compounded the mixture of glue used in cementing the pieces of wood together, and holding the lead fast. But this does not nearly exhaust all the labour concerned in the product. Machinery was required to dig for the lead, and coals were needed to keep in action the engines that drove the machinery. Coal-miners, smelters, iron-moulders, mechanical engineers had all a part, therefore, in the construction of the pencil; and not only they, but all the persons engaged in the industries necessary to feed the businesses of coal-mining, smelting, etc. Ships brought the wood of which the pencil was made, railways carried the lead; and, apart from all these, agriculture was required to produce the food which kept in life the various workers employed in all these industries. It would be impossible to apportion the part performed by each different class of labourers in the product, in the example given; but it serves to show the entire dependence of one industry on another, under the present system; and the means by which anything affecting in a permanent or serious degree one branch of trade is certain to exercise economic consequences on many others. It is this which embodies the real organisation of industry in modern times. It is the consequence, as the above illustration shows, of the manifold specialisation of labour and capital. It is probably to this phase of modern life, more than to any other, that we owe the growth of economics as a science; and it is in the fuller consideration of the mutual dependence of various forms of capital and labour on one another—what is called the social aspect of industry—that further developments of the science in all likelihood are to be looked for.

INFANTS. The civil law distinguishes two stages of infancy, the one previous and the one subsequent to the attainment of puberty. The distinction has been retained in many continental countries and also in Scotland, but English law recognises one stage of infancy only, viz. the whole time before the age of twenty-one. Infants are subjected to various disabilities (as to which see DISABILITIES OF INFANTS), and their persons as well as their property are frequently placed under the care of a guardian. This is always the case on the death of an infant's father. Before 1886 the testamentary guardian appointed by the father

was not in any way subject to the mother's control, but the Guardianship of Infants Act 1886 provides that on the death of the father the mother is to be the guardian either alone or jointly with any guardian appointed by the father. The mother may also by deed or will appoint any person to be guardian of her infant children after the death of herself and the father. Infants are but rarely placed under the guardianship of a third person during the father's lifetime, and the only procedure available for that purpose is an application to the Chancery division of the High Court; the court will not, however, interfere with the father's authority except on very strong grounds, as for instance habitual cruelty or immorality. Modern statutes have in various ways extended the legal rules for the protection of infants. Thus it is provided by the Prevention of Cruelty to Children Act 1889, that any person over sixteen years of age, who, having the custody of a boy under the age of fourteen years or of a girl under the age of sixteen years, wilfully ill-treats or neglects such boy or girl, shall be liable to a fine or two years' imprisonment with or without hard labour. This statute imposes punishments for causing children to beg or to be in any street or in any premises licensed for the sale of intoxicating liquor, "whether under the pretence of singing, playing, performing, offering anything for sale, or otherwise." It authorises any petty-sessional court to order a child to be taken out of the custody of any person convicted or committed for trial for ill-treatment or neglect of such child. Another danger to which infants of more mature age are exposed has been met by the Betting and Loans (Infants) Act 1892, which forbids circulars to be sent to infants inviting to bet or borrow money. An Act passed in 1901 imposes a penalty on any person selling intoxicants to a child below the age of 14.

[As to the legal position of infants, and the duties and rights of guardians, see Simpson, *The Law of Infants*, 2nd ed., by E. J. Elgood.—Eversley, *The Law of Domestic Relations.*] E. S.

INFLATION

Great Britain, 1797-1819, p. 405; United States, 1862-1879, p. 406.

GREAT BRITAIN. The examples employed for illustration are that of Great Britain in the years 1797-1819, and that of the United States in 1862-79.

Many more might be cited, but these are sufficient to show the main results of an excessive supply of paper money not redeemable in specie. While "money itself is a mere contrivance for facilitating exchanges which does not affect the laws of value," of itself, an excess of the paper money in circulation issued by official fiat, and without any reference to the cost of production of the precious metals represented by it, must inevitably influence prices. The theory on the subject is explained by Professor Walker (*Money*, ch. xiv.-xvii.) with great clearness, and with copious illustrations.

Specie payments in Great Britain were suspended by order in council, 26th February 1797, owing to a run on the Bank of England. The Bank Restriction Act was passed in that year. The resumption of specie payments on the gold basis, established by the act of 1816, was directed by Sir Robert Peel's Act of 1819, and completed in 1821 and 1822. The Bank of England resumed payments in specie on 20th August 1819

The effect was well described by Ricardo. "From 1797 to 1819 we had no standard whatever by which to regulate the quantity or value of our money. Its quantity and its value depended entirely on the Bank of England, the directors of which establishment, however desirous they might have been to act with fairness and justice to the public, avowed that they were guided in their issues by principles which, it is no longer disputed, exposed the country to the greatest embarrassment. Accordingly, we find that the currency varied in value considerably during the period of twenty-two years when there was no other rule for regulating its quantity and value but the will of the Bank" (Ricardo's Works, 2nd ed., 1852; London, *On Protection to Agriculture*, § 5, p. 467).

The effect of the restriction of cash payments, and the divergence produced between the value of gold and of the paper currency, is broadly shown by the following Table, derived from Mushet.[1]

Market Price of Gold, Value of Currency and Depreciation of Value of Currency in England, 1800-1821.

Year.	Average market price of gold per. oz. from February 1800-1821.	Average per cent of the value of the currency at the market price of gold.	*Average per-centage depreciation of value of the currency.*

[1] By the evidence of Mr. Abraham Goldsmid before

In considering this table the further question remains: Does the premium on gold, in a country having inconvertible paper, fairly measure the full depreciation in respect to purchasing commodities? Professor Walker considers (*Money*, p. 388) that the power of the paper was "much further diminished than its power to purchase gold."

The fluctuations in prices for the period (1797-1819) as chronicled by Tooke, *History of Prices*, vol. i. pp. 210-373, vol. ii. pp. 1-6, and 387-420, are illustrated by the following figures.[1]

Year.	Prices per quarter, Winchester measure. Mean price for the year.		Butter (Waterford), per cwt.		Tea (Congou), per lb.				Timber (Memel Fir), per load.			
	s.	d.	£	s.	s.	d.	s.	d.	£	s.	£	s.
1797	62	0	85	88	2	10	4	5	2	15	..	
1798	54	0	60	63	3	0	3	9	2	10	3	0
1799	75	8	78	82	2	5	2	7	3	8	3	10
1800	127	0	85	90	2	10	3	7	5	10	5	15
1801	128	6	115	117	3	4	3	6	5	15	6	0
1802	67	3	65	70	3	0	3	9	3	12	3	14
1803	60	0	85	94	2	8	3	8	5	5	6	5
1804	69	6	75	80	2	8	3	3	3	15	4	0
1805	88	0	68	70	3	1	3	6	3	15	4	0
1806	88	0	96	100	2	11	3	8	3	10	3	15
1807	78	0	108	110	2	10	3	9	4	0	5	0
1808	85	3	100	105	3	2	3	8	6	10	7	0
1809	106	0	82	84	3	0	3	7	14	0	14	10
1810	112	0	90	95	3	1	3	10	8	10	9	10
1811	108	0	115	118	2	11	3	6	10	0	11	10
1812	118	0	110	118	3	2	3	8	9	10	10	0
1813	120	0	84	90	2	11	3	7	5	10	7	0
1814	85	0	138	140	3	5	3	10	7	5	7	15
1815	76	0	111	116	3	2	3	7	5	0	5	10
1816	82	0	62	68	2	6	3	6	3	5	3	15
1817	116	0	93	94	2	9	3	5	2	10	2	15
1818	98	0	130	134	2	11	3	7	3	5	3	10
1819	78	0	74	78	2	10	3	6	3	10	3	15

The general effect is perhaps more clearly shown by Jevons's table of prices in his chapter on the Depreciation of Gold (*Investigations in Currency and Finance*, p. 155).

Year.	Average ratio of prices to the prices of the year 1849 (1849=100).
1789	133
1799	202
1809	245
1819	175
1829	124
1839	144
1849	100

Jevons (*Investigations in Currency and Finance*, ch. iii. heading p. 119) warns us (pp. 130-131) against attributing every rise in prices to the influence of the monetary circulation; but while he regards that Tooke was "partly and only partly right" in holding this view, he considers that "we must assign some part of the elevation of prices" to the manner in which the precious metals were driven out of circulation by the use of paper. It is difficult to estimate with absolute accuracy the effect of over-issues of irredeemable paper on prices. The price of some articles of consumption appears to have been more largely influenced by this cause than that of others, during the period between 1797 and 1819. Again, the effect of alterations in the amount of the currency on prices is more marked at some periods than at others, according as banking facilities are largely used or otherwise. But the table which Jevons himself has compiled leaves no doubt that the inflation resulting from the over-issues of paper currency during the period of bank restriction in Great Britain must have been very great, and that it must have largely exceeded the difference between the value of gold and that of the currency indicated in Mushet's tables quoted above.

UNITED STATES (1862-1879). The period of inconvertible paper money in the United States from 1862 to 1879 is often referred to as the inflationist period. Strictly speaking, "inflation" took place in the United States at other times, markedly in 1815-18 and in 1834-39,—both these being connected with bad banking legislation,—and again in 1854-57, when there was a very simple case of inflation and crisis, not complicated in essentials by currency derangement. But the period 1862-1879, as the one in which the features of "currency inflation" were most marked, will be the one dealt with here.

The issues of paper money began under great financial stress in the course of the civil war, in February 1862, when a first batch of 150 millions of dollars (30 millions sterling) was put out; two more of the same amount followed in July 1862 and March 1863, making a total issue of 450 millions (90 millions sterling) of United States notes or "greenbacks." In addition there were put forth in 1863 and 1864 considerable amounts, the maximum being about 200 millions (40 millions sterling) of interest-bearing legal tender notes, which inflated the currency still further. The result was a rapid disappearance of specie in 1862, and a sharp rise in prices in 1862-65. With the close of the civil war in 1865, the administration—and especially Mr. M'Culloch, the secretary of the treasury,—set to work at once to contract the paper issues, and succeeded without much difficulty in getting rid of the interest-bearing notes referred to. A beginning was also made in contracting the United States

the Bullion Committee 1810, the market price of gold was stated to be £4 per ounce from 1803 to 1809. *Third Report of Royal Commission on Depression of Trade and Industry*, Appendix B. Memorandum of Standard of value. R. H. Inglis Palgrave, p. 314.

[1] Tooke's *History of Prices*, vol. ii. pp. 389, 408, 416, and 417 London, 1838.

notes proper. But in April 1866 congress passed a resolution restricting the pace at which the notes should be paid off; for six months no more than 10 millions of dollars (2 millions sterling) of notes should be withdrawn, and thereafter no more than 4 millions (£800,000) a month. This resolution marks the beginning of the struggle between the inflationists and the advocates of resumption; for the paper issues had been made solely under financial stress in the civil war, and had in no quarter been originally regarded as advisable or likely to endure. The inevitable hardships of contraction and falling prices caused the inflationist movement. The inflationists urged the permanent retention or increase of the inconvertible paper money, the most extreme wing demanding the issue of enough paper to pay off the whole funded debt—over 2000 million dollars (400 millions sterling); the most moderate asking only that the volume of paper be left unchanged, so that the country might "grow up" to it. From 1866 to 1879 the contest was carried on with varying fortune in congress and before the public. In 1868 the inflationists gained a point by the passage of an act forbidding further contraction and leaving the volume of the United States notes at the point where it then stood—356 millions (71 millions sterling). In the height of the panic of 1873 the then secretary of the treasury, Mr. Richardson, put forth some notes previously retired, under questionable legal authority. This became the occasion for a bill, passed by both houses of congress in 1874, providing for an increase of the paper issues to 400 millions (80 millions sterling). The bill marked the height of the inflationist movement; it was vetoed by President Grant, who thus dealt the movement a heavy blow. A compromise bill was then passed, in 1874, fixing the volume of United States notes at 382 millions (76½ millions sterling). Next year (1875) the end of the struggle was brought in sight by the passage of the Resumption Act, which provided for resumption of specie payment in 1879. A gradual decline in the volume of paper was to take place *pari passu* with an expected enlargement of the volume of national bank notes. But this decline was again stopped by an act passed in 1878, which virtually fixed the amount of United States notes at the point then reached —$346,681,016 (69⅓ millions sterling). At that they have remained to the present time (1895). Resumption was successfully accomplished at the date fixed (January 1, 1879); and therewith the movement for paper money inflation came to an end. The demand for an increase in the currency after 1879 took another direction in the agitation for the free coinage of silver or the issue of currency based on silver purchases.

[There is no good history of the monetary policy of the United States since 1860. Some accounts of it are in Bolles, *Financial History of the United States*, Philadelphia, 1886, vol. iii.; J. K. Upton, *Money in Politics*, Boston, 1885. The texts of the various legislative measures are accurately collected in Dunbar, *Laws of the United States on Currency, Finance, and Banking*, Boston, 1891.]

F. W. T.

INGOT. Metal cast in a mould of a size and shape convenient for handling. The word, which is derived from the wedge- or tongue-shaped ingots used by the Romans (*lingo*, to lick with a tongue, Fr., *lingot*), is seldom used in connection with other than the precious metals, though such a cast block of any metal may properly be called an ingot. The shape of the ingots of the precious metals now in use in this country, though varying to some extent, generally approximates to that of an ordinary brick made with slightly sloping sides. In the London bullion market these pieces of metal pass by the name of "bars."

In China transactions in bullion are carried on by means of shoe-shaped ingots, known as "Sycee" silver; while in Japan ingots of copper are cast, under water, into canvas receptacles, the shape of the resultant mass being that of a shallow dish or saucer.

Gold ingots sent by the Bank of England to the Mint for coinage are of an average weight of 400 ounces troy. They are of two kinds—"coarse" and "fine." The latter are not, however, composed of metal which is absolutely pure, but have a mean millesimal fineness of 999, while the coarse bars contain on an average 897 parts of fine gold in 1000. Prior to 1889 the mean weight of such ingots was 200 ounces troy, but in consequence of changes in the practice of the bullion market, their weight was then doubled.

The silver ingots purchased by the Royal Mint for coinage are of an average weight of 1100 ounces troy, and an average millesimal fineness of 995·8.

F. E. A.

INHABITED HOUSE DUTY, a tax on inhabited houses calculated by reference to their annual value and payable by the occupier, was first imposed in Great Britain in 1778, the idea being derived from the *Wealth of Nations* (bk. v. ch. ii. part ii. art. i.). Originally the rates were 6d. in the £ for houses worth £5 and below £50 per annum, and 1s. in the £ for those worth £50 or more. The tax was continued at various rates, the highest being 2s. 10d., till its repeal in 1834. This tax, rather than the more objectionable window tax, was selected for repeal on the ground that the great houses, such as Chatsworth, etc., being charged much more highly, relatively, to the window tax than to the house tax owing to the difficulty of ascertaining their annual value to let, the repeal of the window tax would benefit more particularly the richer

classes. The annual produce of the tax at the date of the repeal was about £1,200,000.

This selection was ultimately allowed to be a mistake; in 1851 the policy of 1834 was reversed, the window tax repealed, and the inhabited house duty re-imposed with certain alterations. The rates were 6d. for shops, public-houses, and farm-houses, and 9d. for dwelling-houses. In 1890 graduation was reintroduced, to the extent of charging the duty at lower rates as respects houses of small annual value. The present rates are:—

On shops, public-houses, hotels, inns, coffee-houses, farm-houses, lodging-houses, of the annual value (without any allowance for repairs) of

£20 and not exceeding £40—2d. in the £
exceeding £40 „ £60—4d. „
exceeding £60 . . . . 6d. „

On private houses, clubs, and business premises other than shops (unless exempt) of a similar annual value, 3d. 6d. or 9d. in the £ as the case may be.

The principal exemptions are:—houses below £20 of annual value; houses belonging to His Majesty or any of the royal family; public offices; hospitals; charity schools; poorhouses; houses or tenements occupied solely for business or professional purposes (a caretaker allowed); artisans' dwellings. The tax is under the administration of the commissioners of inland revenue, and the chief enactments concerning it are:—14 & 15 Vict. c. 36; 43 Geo. III. c. 161; 48 Geo. III. c. 55 (Sch. B); 41 & 42 Vict. c. 15, § 13; 53 & 54 Vict. c. 8, §§ 25 and 26; 54 & 55 Vict. c. 25, § 4; 3 Edw. VII. c. 46, § 11. It does not extend to Ireland.

In 1904-5 the net receipt from the tax was £2,014,206. The following table shows the number and annual value of the houses charged in 1903-4:—

	Number.	Annual Value.
Private Dwelling-houses	1,350,399	£62,256,746
Residential Shops	312,634	16,018,797
Hotels, Public-houses, and Coffee-houses	96,477	9,468,249
Farm-houses	33,073	828,279
Lodging-houses	23,459	1,541,026

In 1901 the royal commission on local taxation recommended (Final Report, p. 21) the transfer of this imperial tax to the local authorities in relief of rates [ed. 638].

INHERITANCE, ESTATE OF. An estate in land extending beyond the duration of one or more lives is called an "estate of inheritance." Such an estate must be either an estate "in fee simple, which in popular language is described as absolute ownership," or an estate tail (see ENTAIL, LAW OF). E. S.

INHIBITION (Scots law). An order against contracting any debt which may become a burden or charge on heritable property (realty) or which may give rise to process issuing against the realty of the party inhibited, to the prejudice of the complainer. It takes effect as of course by registration, in the General Register of Inhibitions in Edinburgh, of a summons containing a "warrant for inhibition," duly issued and served. The inhibition is personal to the debtor, and applies only to realty vested or in expectancy at its date, and to voluntary obligations undertaken after its date. The effect of an inhibition, standing alone, is merely to deter purchasers; but it may be followed by an "adjudication," by which the creditor may be adjudged a preference over other creditors whose claims originated after the inhibition. There is also an inhibition by a husband against his wife—obtained by a bill to the Court, issued as of course without reason assigned, and registered in the General Register of Inhibitions,—by which it is notified to the public that the wife's agency has been cancelled, except in regard to necessaries for which it may be proved that the husband has not otherwise made provision. A. D.

INLAND NAVIGATION. See CANALS.

INOFFICIOSUM TESTAMENTUM is the term used in Roman law to signify a will which may be set aside because it violates the duty of natural affection existing between certain near relations, as when a parent, without proper cause, leaves less than the legal share (*portio legitima*) to a child, or a child leaves less to a parent (see LEGITIM). E. A. W.

INSCRIBED STOCK. A SECURITY (*q.v.*) is called "inscribed" to distinguish it from a security which passes from hand to hand by delivery. A register is kept, where in the case of English or government loans or in the case of shares in an English company, transfer of ownership can be made. Registration or inscription is found suitable to English habits and ideas. On the continent and in America there is a prejudice against anything which publishes the ownership of securities, and bonds or shares to bearer are there preferred. As to the risk of forged transfers of inscribed securities see FORGED TRANSFER. A. E.

INSCRIPTION MARITIME (FRANCE)—the system of recruitment for the navy organised by a law of the year iv. of the first republic (1796). All men who have made two over-sea voyages on a state or merchant vessel, or have served eighteen months at sea, or been two years engaged in fishing, are inscribed on the maritime register, and may be called for service in the fleet from the age of eighteen to fifty. The period of obligatory service is from twenty to twenty-seven years of age, after which the *inscrits* pass into the reserve and are only liable to service in case of war, and in the order of the classes to which they belong, those most

recently liberated being taken first. From the ages of eighteen to twenty the young men may, on demand, anticipate the time for commencing the period of obligatory service. Since 1874 engineers and stokers on steamers are comprised in the maritime inscription. The *inscrits* enjoy many privileges; they have a monopoly of the fishing in French waters, and may alone obtain concessions of parts of the shore or banks of tidal rivers and salt-water pools, for taking or breeding fish; they are not liable to any other public service; and have a right to a pension at the age of fifty, after twenty-five years' service in any kind of navigation, which pension is continued, but reduced, to their widows and orphans. A contribution of 3 per cent of their wages, whether earned on state or merchant ships, is, however, made to the pension fund, called the *Caisse des Invalides de la Marine*. During the period of obligatory service the men may obtain furloughs for service on merchant or shipping vessels. The number of men belonging to the maritime inscription serving in the fleet is about 24,000, forming about two-thirds of the crews, the remainder are volunteers or men drawn in the ordinary military conscriptions to serve as marines, not enjoying the privileges of the *inscrits*, and having no right to a pension although liable to military service to the age of forty-six (cp. IMPRESSMENT).

["Rapport adressé au Ministre de la Marine au nom de la Commission chargée de l'étude des questions se rattachant au régime de l'inscription maritime," *Journal Officiel*, 12 Decembre 1890.]

INSOLVENCY. See BANKRUPTCY LAW AND ADMINISTRATION.

INSPIRATIONISTS. See AMANA SOCIETY.

INSTALMENT. When the payment of any sum of money, instead of being effected altogether on one date, is to be divided into several parts to be effected on certain successive dates it is called a payment by instalments. A. E.

INSTITORIA ACTIO is an action of Roman law maintainable against the owner of a business on account of a contract entered into with the superintendent or manager (*institor*). The manager himself, as party to the contract, was liable to an action on the contract he had made, as well as his master—Roman law, owing principally to the frequent employment of slaves in commercial transactions, not fully recognising the principle of contractual agency, which is essential to modern commerce. E. A. W.

INSTRUMENT, NEGOTIABLE. A negotiable instrument differs from an ordinary contract or instrument, securing the payment of money, in three respects:

(1) It is assignable by virtue of the usage of trade, whereas a contract or "thing in action" is not ordinarily assignable at common law. A negotiable instrument purporting to be payable to bearer may be assigned by mere delivery; or if purporting to be payable to order, then by indorsement completed by delivery.

(2) The consideration for its issue or transfer is presumed until the contrary is proved.

(3) If it gets into the hands of a holder for value without notice, he holds it free from any defects of title which would have vitiated it in the hands of any previous holder.

The term "negotiable instrument" is usually confined to the original and typical negotiable instruments, namely, bills of exchange, promissory notes, and cheques; and the term "negotiable security" is applied to the negotiable bonds and scrip which in recent years have become so common in the money market. For the most part these instruments would be governed by the same considerations as promissory notes payable on demand. For revenue purposes, however, they are subject to special stamp regulations (see also COMMERCIAL INSTRUMENT).

INSURANCE

History, p. 409; Life, Theory of, p. 410; Law and Practice of Life, p. 416; Marine, p. 418; Mutual, p. 419; State (Germany), p. 419.

INSURANCE, HISTORY. There appear to have been two forms of contract akin to insurance known to the ancients. The first is mentioned by A. Böckh (*Public Economy of Athens*). He states that "the idea of an institution for the insurance of slaves first occurred to Antigenes of Rhodes" (in the time of Alexander the Great, 356-323 B.C.), "who undertook, for a yearly contribution of eight drachmas for each slave that was in the army, to make good his price, as estimated by the owner at the time of elopement." Bottomry (see BOTTOMRY, LOAN ON) was also known to the Greeks. Among the Romans, the earliest mentioned transaction of this nature is the contract, noticed by Livy, made after the battle of Cannæ, for the supply of stores to the Roman government, the contractors stipulating that the state should bear all losses which might arise from the enemies' attacks, or from storms. But with the barbarian invasion, and consequent cessation of commerce, all such practices fell into disuse. The origin of modern insurance is obscure. Instances of some form of insurance are found amongst various nations in early mediæval times, but there appears to be no direct connection between them and the methods now adopted. The first form of mediæval insurance was undoubtedly marine, the system being afterwards extended to other objects.

Many countries or towns have claimed to be the birthplace of *marine* insurance, particularly Barcelona, Wisby, and Bruges; but it appears

really to have originated among the commercial cities of Italy, the earliest mention referring to Florence (14th century). It may even have been practised in the 13th century: an unedited Pisan document (the *Breve Portus Calleritani*, 1318) is supposed to refer to insurance at Cagliari. *Chambers of Insurance* were established at an early date on the continent, notably at Barcelona and Bruges. The period of its introduction into England is equally obscure; in the earliest statute on the subject (1601), it is stated that it "hathe been tyme out of mynde an usage amongst merchantes." Bacon quotes it as a usual practice in 1558.

The insurance on a ship and its cargo representing usually too large a sum for a single individual, it is divided amongst several underwriters, each of whom guarantees such a fraction of the risk as he thinks proper. By far the greater portion of marine insurance in this country is done at Lloyd's, now a corporation, but formerly simply a meeting-place for underwriters. This institution originated in the coffee-houses established in London towards the end of the 17th century, one of which, owned by Edward Lloyd (first mentioned in 1688), became the resort of marine insurers, and ultimately all their underwriting was done there; as the business grew larger, it was removed to the Royal Exchange in 1774. Two companies, the "London" and the "Royal Exchange" Assurance Corporations, obtained in 1720 a charter with a monopoly, as companies, of marine insurance business. No other company was formed until 1824, when Rothschild obtained the repeal of this exclusive charter, and founded the "Alliance" Insurance Company. The companies did not interfere much with individual underwriting. The amount of marine property insured in 1810, according to estimates made at the time of the Royal Commission, was about £160,000,000, of which some £130,000,000 was underwritten at Lloyd's.

The first *fire* insurance office in London was set up after the Great Fire, in 1667, by N. Barbon (*q.v.*), although schemes had been suggested in 1635, 1638, and 1660. But fire insurance almost certainly existed earlier on the continent. Part of the functions of fire insurance companies was to extinguish fires; this was undertaken in their own interests, and all the important companies in London maintained fire brigades until 1866, when they were taken over by the Metropolitan Board of Works. Fire engines were first introduced into London from Holland in 1633. Barbon's method was individual underwriting: the first joint-stock association was founded in 1681 "at the back of the Royal Exchange." The oldest existing office is the "Hand in Hand," which dates from 1696. The growth of fire insurance business can be best judged from the following table:

Year.	Value of Property insured.
1783	£135,000,000
1800	200,000,000
1840	645,000,000
1860	1,000,000,000
1868	1,430,000,000

These values are the amounts on which duty was paid; as this was abolished in 1869, statistics of fire insurance since 1868 are only officially given of such offices as undertake also life business. Life insurance offices are compelled to make an annual return to the Board of Trade. The *Finance Chronicle*, however, gives the premiums received by fifty-four British offices in 1894 as nearly £19,000,000, and the claims paid as £13,000,000.

[C. Walford, *Insurance Cyclopædia*, 1871-80. —F. Hendriks, "Contributions to the History of Insurance," in *Assurance Magazine*, vol. ii., 1852. —F. Martin, *History of Lloyd's and of Marine Insurance in Great Britain*, 1876.—W. Gow, *Marine Insurance*, 1895]. R. H. H.

INSURANCE, Life, Theory of. The object of insurance is to spread the burden of losses, which to the individual would be crushing, over a large body of insured, and so render that burden easy to bear. This object is effected by collecting from each of the insured a sum, called a premium, proportioned to the risk to be insured against; and out of the fund so formed, those of the insured who have experienced loss from the contingencies covered by the insurance, are indemnified.

Materials are not available for ascertaining accurately the extent to which life assurance is practised in the United Kingdom. All active companies are required by the Life Assurance Companies Act 1870 to make periodical returns to the board of trade, but these returns do not distinguish between home and foreign business, and they are not made up by the different companies to a uniform date. The last available figures (board of trade, 1894) show that at their then latest periodical valuations, British companies were liable under their life policies to the amount of £628,070,176; that in their respective last financial years they received in premiums £22,790,349; and that at the dates of the last balance sheets the invested funds, accumulated entirely out of premiums, and exclusive of share capital, amounted to £194,175,429. Assurances on lives insured by British offices, and resident in the colonies and abroad, are included in these aggregates, but on the other hand assurances granted by colonial and foreign companies on lives resident in the United Kingdom are excluded. These sources of error are in opposite directions, and the figures may be taken roughly to represent the

amount of life assurance existing at the present day on the lives of persons resident in the British Isles.

From the magnitude of the totals it is manifest how important to the community is a sound system of life insurance, and the object of the present article is to explain, as briefly and as simply as possible, the scientific principles on which the business is conducted, and which experience has shown to be safe and trustworthy.

In early days life policies were granted only for short terms, generally for a year, or less; the earliest, of which full particulars have been preserved, was made on 15th June 1583, for £383 : 6 : 8 on the life of Wm. Gybbons for one year, the premium being at the rate of £8 per cent. No record seems to remain of the age of the life assured, probably that was a detail not thought of at the time. This policy was underwritten by thirteen private individuals, after the manner of marine insurances at Lloyd's in the present day.

About the year 1650, societies for the assurance of lives began to be formed. The principle on which they were worked was, that each surviving member had to pay a fixed contribution in respect of each death; so that the amount receivable by the representatives of a deceased member varied according to the numbers in the society at the time of his death, and the contributions of the members varied according to the number of deaths which occurred in any particular year. No attempt was made to graduate the contributions of members according to their respective ages. In 1705 the "Amicable Society" was formed. Its system at first was to charge each member an annual premium of £6 : 4s., besides certain annual dues, and to divide among the representatives of the members who might happen to die in any particular year the amount received in premiums in that year to the extent of £5 per contributing member, so that in a year in which there happened to be few deaths, the share in respect of each death would be large; and in the event of many deaths, small. At first no limit of age was imposed, but soon it was found that an influx of an undue proportion of old lives would reduce the death money inconveniently, and in 1707 the regulation was passed that members on admission must be between twelve and forty-five years of age. For a century this rule remained in force, and it was not until 1807 that a table of premiums was adopted graduated strictly according to age.

The weakness of the early assurance societies was that with the growing age of the members the death rate increased and the claims became onerous, so that either the contributions demanded from the members had to be augmented, or the amounts paid on death reduced. The societies formed on this unsound basis all succumbed to the inevitable strain, except the Amicable, which, taught by experience, altered its constitution; but in 1762 the Equitable Society was formed on the principle which is now recognised to be the only sound one; and it still carries on business as one of the most successful financial institutions of the country.

Life insurance differs from other descriptions of insurance in that the risk to be insured against is constantly increasing with the duration of the contracts. That the rate of human mortality increases with the age was dimly known at a very early period, the Romans at the commencement of the Christian era valuing annuities charged on estates by a table giving values large for young lives, and constantly diminishing with advancing age. There seem, however, to have been no efforts made to estimate the true rates of mortality until 1671, when John de Witt, Grand-Pensionary of Holland, presented a report, not published until long afterwards, on the subject, to the states-general; and it was not until 1693 that the first real mortality table was formed, by E. HALLEY, Astronomer-Royal of England, and published that year in the *Philosophical Transactions*. It was based on observations made on births and funerals in the city of Breslau.

When the Equitable Society was started in 1762, it employed for the calculation of its premiums a mortality table constructed from the London bills of mortality. This showed heavy rates of mortality, beyond those which the subsequent experience of the society proved really to prevail, and in 1781 the Northampton table was adopted which, however, still showed an excessive death-rate.

A mortality table tells us how many persons out of a given number born, or starting from a given age, survive to each subsequent age; and consequently it also shows how many out of the given number at the commencement die in each year of their age. The number with which the table commences is called the *radix* of the table. It is usual to arrange the table in columns, the first column containing the age attained, the second the number who attain that age, and the third the number who die between that age and the next higher age. The age is usually denoted by x, or one of the other letters at the end of the alphabet. The number who attain age x is denoted by the symbol l_x, and the number who die between ages x and $x+1$ by the symbol d_x. The following is an illustration of a mortality table. It is the early portion of the H^M *Healthy Males* table formed by the institute of actuaries from the experience of twenty British life offices. It will be observed that the commencing age is ten years, and the radix is 100,000. The radix is a purely arbitrary quantity, chosen only for the sake of convenience—

Age.	l_x.	d_x.
10	100,000	490
11	99,510	397
12	99,113	329
13	98,784	288
14	98,496	272
15	98,224	282
16	97,942	318
17	97,624	379
18	97,245	466
19	96,779	556
20	96,223	609
21	95,614	648
22	94,971	650
23	94,321	638
24	93,683	622
25	93,061	617

The mortality table affords the means of calculating the probabilities of life and of death. Thus, there being l_x persons alive aged x, of whom l_{x+t} survive to age $(x+t)$, there are, out of l_x chances altogether, l_{x+t} chances of any one of the l_x persons surviving to age $(x+t)$. Therefore the probability of a person aged x surviving to age $x+t$ is $l_{x+t} \div l_x$. This probability is denoted by the symbol ${}_tp_x$, or when $t=1$, simply by p_x. In a similar way, as $l_x - l_{x+t}$ persons, out of l_x living at age x, die before reaching age $(x+t)$, the probability of dying between ages x and $(x+t)$ is $(l_x - l_{x+t}) \div l_x$, which $= 1 - {}_tp_x$.

In financial transactions involving life contingencies, the operation of interest must be taken into account, because the premium has to be paid by the assured at the commencement of the contract, and the sum assured is not paid until the close; consequently the office keeps the premium invested in the interim, and secures interest on it. If by i we denote the interest in a year on £1, or more generally on 1 unit of value, whether that unit be a pound, a franc, or a dollar, etc., then 1 invested at the beginning of a year will amount to $(1+i)$ at the close. This is called the *amount* of 1 in a year. Similarly if any other sum S be invested for a year, it will produce Si in interest, and at the end of the year will amount to $S(1+i)$. The original unit, 1, having amounted to $(1+i)$ in a year, if that amount be again invested, it will amount at the end of the second year to $(1+i) \times (1+i)$ or $(1+i)^2$, which is the amount of 1 at compound interest in two years. Proceeding thus, we find that the amount of 1 in three years is $(1+i)^3$, and generally the amount of 1 in t years is $(1+i)^t$.

Seeing that $(1+i)^t$ is the amount of 1 in t years, it follows that 1 is the present value of $(1+i)^t$, to be received at the end of t years; and, by simple proportion, the *present value* of 1 to be received at the end of t years is $1 \div (1+i)^t$ or $(1+i)^{-t}$. This present value is usually denoted by the symbol v^t. Thus, the present value of 1 due at the end of one year is v, where $v = 1 \div (1+i)$ and $(1+i) = 1 \div v$.

Suppose it were desired to provide an endowment of £100 for a child now aged fourteen on his attaining age twenty-one, what premium should be paid down, assuming interest at 3 per cent? It will be well to solve the problem first in general symbols. If there be l_x persons aged x, we shall have l_{x+t} surviving at age $(x+t)$. Therefore, if an endowment of 1 is to be secured to each of them at age $(x+t)$, the sum of l_{x+t} must be provided at the end of t years. For that purpose, $v^t l_{x+t}$ paid down now and invested will suffice; and as there are l_x persons who must each pay his proportion, the sum to be paid by each is $v^t \cdot \frac{l_{x+t}}{l_x}$ or $v^t {}_tp_x$. This is called the present value of, or the single premium for, the endowment. Thus, the present value of the endowment is the sum to be received, discounted down to the present time, and multiplied by the probability of receiving it. Taking up now the numerical example: by the specimen mortality table given above, there are 98,496 children aged fourteen, of whom 95,614 will attain the age of twenty-one; hence, if each of the survivors is to receive £100, the sum of £9,561,400 will have to be provided at the end of seven years. At 3 per cent interest the present value of 1 to be received in seven years is ·8130915, and the present value of £9,561,400 is £7,774,293. There being 98,496 children, the sum to be paid down now in respect of each is £78·930, or £78 : 18 : 7, which is the present value of, or the single premium for, the endowment of £100. Or, looking at the matter in another way: the probability of a child aged fourteen attaining the age of twenty-one is $95,614 \div 98,496$ or ·97073; and the value of 1 to be received certainly at the end of seven years is ·8130915. Therefore the value of 1 to be received conditionally on a child aged fourteen surviving until aged twenty-one is $·97073 \times ·8130915$ or ·78930, and the value of £100 so to be received is £78·930 as before.

It should be noted that in speaking of the present value of an endowment we assume a sufficient number of endowments to allow of the law of average asserting itself. If there were only one endowment, and the child happened to survive, the sum paid at the commencement would not amount to the sum to be provided. In the case of the above example it would amount to only £97·073, and the £100 could not be paid in full. On the other hand, should the child happen to die, there would, at the end of the term, be the sum of £97·073 in hand without a claimant. It is only when there are a sufficient number of lives to obviate accidental fluctuations that the figures work out properly. The same observation applies to every kind of contingent benefit.

An annuity is an annual payment to be made either for a fixed term of years, or during the existence of a given life, or of a given combination of lives. In the former case the annuity is called an annuity-certain, and, in the latter, a life annuity, or simply an annuity. According to the elementary principles already discussed, the present value of the first payment of an annuity-certain of 1 per annum is v; that of the second payment v^2, and so on. If the annuity be for n years its value is denoted by $a_{n}>$, the angle round the suffix showing that no contingency is involved. We therefore have the value of an annuity-certain

$$a_{n}>, \times = v + v^2 + v^3 + \text{ . . . etc. . . . } + v^n.$$

The series is a geometrical progression, and by the usual formula for summing such a series, the

sum is $v\frac{1-v^n}{1-v}$, from which, remembering that $v=\frac{1}{1+i}$, we have $a_{n\rceil}, =\frac{1-v^n}{i}$.

It will readily be seen that a life annuity consists of a series of endowments, and by the formula we have already obtained for the value of an endowment, we have, writing a_x for the value of the life annuity where the age of the nominee is x,

$$a_x=\frac{1}{l_x}(vl_{x+1}+v^2l_{x+2}+v^3l_{x+3}+\text{ etc.})$$

There is no way of summing this series except by actual addition. Here each number in the column of l_x is multiplied by a power of v, the index of the power having no reference to the age of the life, but only to the length of time which must elapse before a particular payment of the annuity is to take place. If, therefore, we have calculated by the formula the value of an annuity on a life aged x, all the multiplications and additions must be done over again if we are called upon to calculate the value of an annuity on a life of any other age, and the work becomes tedious and lengthy. In early days the labour was abbreviated by employing a simple relation which exists between the value of an annuity on a given life, and that of an annuity on a life one year older. At the end of the first year the life, if he survive, will be entitled to a payment of 1, and he will also be in possession of an annuity for the remainder of his life, the value of which will then be a_{x+1}. He will, therefore, at the end of a year be in possession of cash and of an annuity together worth $1+a_{x+1}$. The value of this at the beginning of the year is $v(1+a_{x+1})$, and the chance of receiving it is p_x. Therefore the actual present value is $vp_x(1+a_{x+1})$ which is a_x. Therefore, commencing at the oldest age in the mortality table, at which the value of the annuity is zero, and working backwards year by year, a complete table of annuity values can be formed, and it is about as easy to calculate the complete table as to calculate the value of an annuity at the youngest age.

If, however, we look again at the series representing the value of the life annuity, we shall easily introduce a modification which will enable us, by a simple division, to calculate the value of an annuity on a life of any age we please. The value of the annuity is represented by a fraction, and if we multiply both numerator and denominator by the same quantity, we do not alter its value. Let us then multiply by v^x, and we have

$$a_x=\frac{1}{v^xl_x}(v^{x+1}l_{x+1}+v^{x+2}l_{x+2}+v^{x+3}l_{x+3}+\text{etc.})$$

where each value of l is multiplied by a power of v, the index of which is the same as the suffix of that particular l. If now we write D_x for v^xl_x, we have

$$a_x=\frac{D_{x+1}+D_{x+2}+D_{x+3}+\text{etc.}+}{D_x}$$

Let us now write the successive values of D in a column, and sum that column from the bottom upwards, and place in an adjoining column against each age the sum of the column D from the age one year older to the end of the table, and let us denote that sum by the symbol N, that is

$$N_x=D_{x+1}+D_{x+2}+D_{x+3}+\text{etc.}+$$

We then have two columns, the relation of which to each other is such that

$$a_x=\frac{N_x}{D_x}$$

Such columns are called commutation columns, and the principles on which they are constructed have been extended and applied to many other kinds of benefits besides annuities. They will be found in all collections of actuarial tables.

One great advantage of commutation columns is, that by means of them the values of temporary and of deferred benefits can be calculated with great facility. Thus, if the life annuity is to run for only t years, all the payments after t years must be left out of account, and it is easily seen that the value of the temporary annuity is $\frac{N_x-N_{x+t}}{D_x}$. If, on the other hand, nothing is to be paid for the first t years, then the value of the deferred annuity is $\frac{N_{x+t}}{D_x}$.

The endowment and the annuity already considered are benefits receivable if a nominee survive, but the same principles hold if the benefit be receivable at death. What is the present value of, or single premium for, an assurance payable at the end of the year of the death of a person aged x? Assuming l_x persons of that age, each to be assured, d_x will die in the first year, and the sum d_x will have to be provided at the end of the year, and the present value of that sum is vd_x. Similarly, the sum d_{x+1} will have to be provided at the end of the second year—its present value is v^2d_{x+1}—and so on for future years. The value of all the l_x assurances is therefore

$$vd_x+v^2\,d_{x+1}+v^3\,d_{x+2}+\text{etc.},$$

and the value of each of them is therefore the sum of that series divided by l_x. By multiplying each of the terms of the series, and also the denominator, by v^x, the value of the fraction is not changed, while a column is thereby formed for assurances similar to the D column already described for annuities. The function $v^{x+1}d_x$ has the symbol C_x assigned to it, and

$$M_x=C_x+C_{x+1}+C_{x+2}+\text{etc.},$$

so that if we write A_x for the single premium for the assurance, we have

$$A_x=\frac{M_x}{D_x}$$

We have thus obtained by independent processes direct from the mortality table, the respective values of the annuity and the assurance; but these two functions are closely related, and, having the value of one, we can at once assign the value of the other. The annuity consists of a payment of 1 to be made at the end of each year which the nominee completes; and the assurance consists of a payment of 1 to be made at the end of that year on which the nominee enters but does not complete, namely the year in which he dies. Therefore the value of the assurance is the difference between the values of two annuities, the one payable at the end of each year on which the

nominee enters, and the other payable at the end of each year which he completes. Now $v(1+a_x)$ is evidently the value of the first of the annuities, and a_x is the value of the second; and we have

$$A_x = v(1+a_x) - a_x$$

This equation is quite independent of the rate of mortality; it depends solely on the rate of interest, and was skilfully used by the late William Orchard in preparing his celebrated *Conversion Tables*. By means of these tables the value of the assurance and also the annual premium for the assurance, can at once, and without calculation, be found from the value of the annuity.

We have found the single premium for the assurance, but it is not often in practice that a single premium is convenient. To find the annual premium we may look on A_x as the purchase money of an annuity, the first payment of which is to be made at once, because it is customary with assurance offices to make the annual premiums payable at the commencement, and not at the end of each year. Since $1+a_x$ is the purchase money of such an annuity of 1 per annum, unity will purchase $\frac{1}{1+a_x}$ per annum, and A_x will purchase $\frac{A_x}{1+a_x}$ per annum, which is therefore the annual premium corresponding to the single premium A_x. Using the symbol P_x for the annual premium, we therefore have

$$P_x = \frac{A_x}{1+a_x}.$$

In former days the single and annual premiums used in practice were those given by the formulas above discussed, but the rate of mortality shown by the mortality tables then in use was much in excess of that actually prevailing, and the rate of interest employed in the calculations was below that which could be secured on safe investments. It therefore follows that the formulas gave rates in excess of those theoretically necessary, and left a margin for expenses and contingencies. The Equitable Society found that margin so great that large surpluses resulted, and these were distributed as bonuses among the policy-holders. In later years, however, when the true rates of mortality were better known, it became the custom, with a majority of offices, to calculate the single and annual premiums by mortality tables closely representing the real facts, and to employ practical rates of interest. Under these circumstances it was therefore necessary to add to the mathematical premium deduced from the mortality table a margin called "loading," to cover the expenses of the business, to provide against contingencies, and to create a fund out of which the policy-holders might obtain bonuses, because the practice of the Equitable in dividing the surplus amongst its members had become very popular, and other societies, in order to compete successfully, had to follow the same course.

We have discussed so far only assurances for the whole of life, and it is not our purpose to go into further detail. By similar processes, more or less complicated according to the nature of the contingencies to be covered, premiums may be calculated for all kinds of risks, but those wishing to investigate the question further should consult the text-books mentioned lower down.

We have already remarked that life assurance differs from assurance of other descriptions in that the risk to be insured against constantly increases with the duration of the contracts. It will be observed that the formula given above for the annual premium provides for a uniform premium payable throughout life. It follows from this that in the earlier years the assured pays an excess beyond that required for the risk, while in later years the risk is greater than the premiums received. Therefore, if the insurance society is to remain solvent, the surplus premiums of earlier years must be religiously husbanded and accumulated at interest, so as to provide for the deficiency when the lives assured become advanced in age. In other forms of insurance all that is necessary in the way of reserves is a sufficient proportion of the premium for the unexpired risk of the year, and a reserve fund to cover accidental fluctuations. With life assurance, however, the case is different. The unexpired risks of the year must be provided for, and also a guarantee should exist to provide against accidental fluctuations; but over and above these two reasons for providing a reserve, there is the increasing rate of mortality, which necessitates large accumulations. In fact, the so-called reserves of life assurance companies are, for the most part, not in the nature of reserves as usually understood; that is, they are not surplus funds to guard against contingencies, but merely accumulations of excess of premiums received when the risk is small, and laid by against the time when the risk will become great; and they are just as much required for the purpose of solvency, and apart altogether from fluctuations, as the premiums themselves. This being a very important principle, in fact the fundamental principle underlying life assurance, it may be useful to give a numerical illustration of its operation. In an ordinary mortality table the rate of mortality increases but slowly for many years, and to base our illustration on it would involve very lengthy calculations. It is better, therefore, to take an exaggerated example, the principle remaining the same. Let a society be supposed to exist consisting of fifty-five persons, and let the rate of mortality be such that one of these will die in the first year, two in the second, three in the third, and so on, until ten die in the tenth year, when all the members of the society will have passed away. Let it be arranged that each of these members be assured for £100 by an annual premium payable throughout the duration of the contract. What will the premium be, and what will be the working of the fund? Of course, in practice, interest would be secured on the investment, but for the present purpose it is a needless complication, and we may leave it out of account. By assuming interest the figures would be slightly altered, but the principle guiding them would not be changed.

Were the rate of mortality to remain constant as at the commencement, we should have one person in fifty-five die in each year, and therefore the premiums to insure £100 for a year would be $\frac{100}{55}$, or £1 : 16 : 5 nearly. Seeing, however, that

in the second year two out of fifty-four die, and in the third year three out of fifty-two, etc., it is manifest that this initial premium would be too small, and if in each year the premium collected were to be equivalent to the risk incurred, the premium would be an increasing one, in the second year $\frac{2000}{54}$, or £3 : 14 : 1 nearly, in the third year $\frac{2000}{52}$, or £5 : 15 : 5 nearly, until in the tenth year it reached 100 per cent, and there would be no assurance at all. It will be found, however, that if fifty-five persons pay a premium in the first year, fifty-four in the second, fifty-two in the third, and so on, the total number of premiums to be paid throughout the ten years will be 385; and, there being fifty-five claims of £100 each to be paid, an easy calculation brings us to 14·2857, being $\frac{1}{7}$ of £100, or £14 : 5 : 9 nearly, as the uniform annual premium to be paid by each member who enters on a year, that £100 may be paid to the representative of each on death.

The following table shows the working of the fund. The first column gives the year, the second the number of members who commence the year, that is the number of premiums to be paid for that year; the third the number of deaths in the year, that is the number of claims to be paid; the fourth the amount of premiums to be received at the commencement of each year, the fifth the amount to be paid in claims in that year, and the sixth the accumulated funds at the end of each year.

(1) Year.	(2) Members at commencement of year.	(3) Deaths in year.	(4) Premiums paid for year.	(5) Claims paid in year.	(6) Funds at end of year.
1	55	1	785·71	100	685·71
2	54	2	771·43	200	1257·14
3	52	3	742·86	300	1700·00
4	49	4	700·00	400	2000·00
5	45	5	642·86	500	2142·86
6	40	6	571·43	600	2114·29
7	34	7	485·71	700	1900·00
8	27	8	385·71	800	1485·71
9	19	9	271·43	900	857·14
10	10	10	142·86	1000	000·00

It will be noticed that the uniform premium, sometimes called the "level premium," of £14 : 5 : 9 per cent is, at the beginning, much in excess of £1 : 16 : 5, the premium for that year's risk, sometimes called the "natural premium," whereas, after a short time, the natural premium becomes much heavier than the level premium. Our hypothetical fund increases until the fifth year, when it attains its maximum, and then it is gradually drawn on to meet the excess of claims, until at the end of ten years, when all the members have died, the funds have entirely disappeared. This illustrates the purpose for which life assurance funds are created. If a life office were to close its doors to new business its funds would increase for many years, remaining for a short time at the maximum figure, and then would begin to be drawn upon, the drafts rapidly increasing in amount, until at last, with the death of the last life assured, the funds would be entirely exhausted.

It is assumed in the calculations of the level premium that the contract will remain in force for the whole duration of the life of the assured, that the assured will pay the premium regularly year by year, that the office will reserve and invest the difference between the premiums received and the amount actually necessitated by the risk incurred, and that on the death of the life assured the claim will be met. It often happens, however, that after a time the policy is no longer required, and in justice to the policy-holder a portion, at any rate, of the excess of premiums he has contributed should be returned to him. This is the surrender-value of the policy. In early days surrender-values were not granted, and the insurance offices reaped large profits from this source. For many years now, however, it has been the custom to grant liberal surrender-values, and this source of profit is a thing of the past. It is not usual to pay back the whole of the reserve value. The company has no option in respect of the continuance of the contract. If the policy-holder tenders the premium the company must receive it, and it is only on the motion of the policy-holder that the contract can be terminated. Manifestly he will be guided by his own interests in deciding whether to continue or surrender, and it is only fair to the other members, who elect to adhere to the bargain, that a portion of the reserve value should be kept in hand. It is, however, a matter of opinion what is a fair and proper allowance to make for cancelled policies, and the practice of the offices differs within moderate limits in this respect. Nevertheless, at the present day, all companies make a substantial allowance.

We have seen above that, for the purpose of solvency, a life company must retain large funds in hand. Were merely the mathematical or net premiums charged, and were it certain that the rate of mortality shown in the mortality table would accurately correspond with the actual event, the accumulations of the company would be exactly the amount of reserve required; but companies charge loaded premiums, and therefore the accumulations in a well-managed office are greater than the necessities of the case demand. It is, therefore, the custom to make periodical valuations. These are of too complicated a character to be discussed here, but briefly we may say that the object is to ascertain how much of the invested funds consists of the excess of premiums which must be set aside to provide for future risks, and how much is real surplus. When the surplus is ascertained, it may be divided according to the constitution of the company, and hence arise the bonuses to policy-holders, which are almost a universal feature of life assurance as carried on in the United Kingdom. The valuation shows what surplus cash is in hand. If the whole of that be allotted as a bonus to increase the sum assured, it is manifest that when the lives are young the same amount of cash will give a larger reversionary addition than when the lives become more advanced in age. Some offices adopt this course, and give a reversionary bonus which decreases as the policy grows older. This, however, is not a system which is very popular with the public, who do not understand the reasons for a decreasing bonus. With many offices, there-

fore, it is the practice, in the early days of the policy, not to divide the whole of the surplus that policy has created, but to retain part of it in hand, so that, later on, when the life has become older, there may be no necessity for reducing the periodical reversionary additions. Hence has arisen the custom of making the valuation of the office at a much lower rate of interest than that which will probably be realised, and here again we have an illustration of the effects of the operation of the law of increasing mortality. Did the mortality not increase with the age, the reversionary bonus would not cost more with the lapse of time, and there would be no need for making these specially great reserves. It thus appears that, in order fully to understand the finance of life assurance, an intimate knowledge of the complicated principles on which it is based is requisite. Space, however, forbids us from entering further upon this most interesting and important question here, but these brief explanations will suffice to show that knowledge and discretion are required to judge wisely of our insurance companies. They differ in essential principles from all other financial institutions, and must be measured by a completely different standard.

[Here only a few of the more important English works on life assurance can be mentioned. For further information consult catalogues of libraries of Institute of Actuaries in London, and of Faculty of Actuaries in Edinburgh.]

J. GRAUNT (*q.v.*) was one of the first English writers; A. DEMOIVRE (*q.v.*) expounded in his *Treatise of Annuities on Lives* (1725) his famous "Hypothesis for the Law of Human Mortality," which, before trustworthy mortality tables existed, was much used in calculating life contingencies. Dr. Richard PRICE published (1st ed. 1771) *Observations on Reversionary Payments*, containing the Northampton Table of Mortality, for many years employed by insurance offices in calculating their premiums and reserves, which, even at the present day, has not been entirely abandoned. Francis BAILY published *Doctrine of Life Annuities and Assurances* (1810); and Joshua Milne, *Treatise on the Valuation of Annuities and Assurances on Lives*, etc. (1815). This latter work contained the Carlisle Mortality Table, the first constructed on correct principles, and which immediately came into very general use. In 1825 Griffith Davies published a tract explaining the nature and use of commutation columns, and a few years later, after his death, his uncompleted *Treatise on Annuities* was published by his executors without date. Also in 1825 Benjamin Gompertz published in the *Philosophical Transactions* his remarkable exponential formula for the law of mortality, which was extended and improved many years later by William M. Makeham in the pages of the *Journal of the Institute of Actuaries*. David JONES'S work on the *Value of Annuities*, etc., appeared in 1844, until recently the principal text-book on the subject; and in 1849 Peter Gray published his *Tables and Formulæ*, an important volume, dealing principally with the construction of life assurance tables. Lastly, in 1887, the Institute of Actuaries issued its official *Text-Book* on life contingencies, by George King.

[Since the establishment in 1848 of the Institute of Actuaries, its journal has been the medium of publication of all important contributions to the science of life contingencies. The first number was issued in 1851, and it has appeared quarterly, with unfailing regularity, ever since. Many useful papers will also be found in the *Transactions of the Actuarial Society of Edinburgh*, commenced in 1863.] G. K.

INSURANCE, LIFE, LAW AND PRACTICE OF. The contract of life insurance is a contract under which, subject to the payment of an annual premium by the insured, the insurer undertakes on the death of the insured or some other specified person to pay a certain sum of money to the representative of the insured or, as the case may be, to the insured himself. Unlike the contract of fire or marine insurance, it is not a contract of indemnity in the strict sense, but the person who originally insures must, by virtue of 14 Geo. III. c. 48, have an insurable interest in the life of the person on whose death the payment is promised, and Lord Ellenborough in the well-known case of Godsall *v.* Boldero (2 Smith, Leading Cases) held that such interest must continue up to the time of the claims becoming due; but insurance companies, as a matter of practice, did not take advantage of this doctrine, which was subsequently overruled by the unanimous decision of the court of Exchequer Chamber in Dalby *v.* India and London Life Assurance Company (2 Smith, Leading Cases). According to the doctrine now governing the subject, the existence of an interest at the time of the insurance is sufficient. The question as to the nature of the interest which is required to make a life insurance effective has been frequently before the courts. A creditor has an insurable interest in his debtor's life; a tenant holding a lease terminable at the end of a life has an insurable interest in such life, and every man is deemed to have an unlimited insurable interest in his or his wife's, and every woman in her or her husband's life. A parent cannot insure the life of a child without having a pecuniary interest in the child's life, but a child's burial expenses may be insured. It is very doubtful whether insurances of this class should be permitted, the temptation to crime resulting being so great. The interest in a life policy may be assigned to a purchaser or donee, and it is provided by the Policies of Assurance Act 1867, that this may be done either by indorsement on the policy or by a separate instrument, but an assignment is not effective for all purposes until a written notice of its date and purport has been given to the insurance company.

As a general rule the proceeds of a policy on the life of the insured, unless assigned during his lifetime, form part of his estate and are

therefore subject to the payment of his debts. It is, however, possible since the date of the Married Women's Property Act of 1882 to take out a policy for the benefit of the wife or husband of the insured or of her or of his children, by which means the person for whose benefit the insurance has been effected takes the insurance money without any deduction in respect of debts unless the creditors of the originator of the policy can prove that his object was to defeat their claims, in which case they are entitled to the payment of a sum equal to the aggregate sum of the premiums paid in respect of the policy.

An insurance policy becomes void if the insured life is terminated by virtue of a judicial sentence (Amicable Assurance Society *v.* Bolland (Fauntleroy's Case), 4 Bligh, N. S. 194) and probably also if the life of the insured is terminated by his own act (see Horn *v.* Anglo-Australian Life Assurance Company, 30 ; Law Journal (Chancery, 511) if he was of sound mind at the time of committing suicide. It is, however, usual to insert express conditions in the policy, so as to provide against events of the nature described, and which in most cases save the rights of assignees for value. Mrs. Maybrick's case raised the question whether a policy taken out by a husband for the benefit of his wife becomes void if the wife kills the husband. It was held that in such a case the trust in favour of the wife must fail, but that the policy is not avoided, and forms part of the husband's estate (Cleaver *v.* Mutual Association [1892], 1 Q. B., 147).

It is frequently stated in the forms of proposal for life insurance that certain statements to be made by the person whose life is to be insured referring to his health or to the nature of his occupation or possible changes of residence, are to form the basis of the contract between the insured and the insurance company. In such a case the untruth of any such statement invalidates the policy (Hambrough *v.* Mutual Company, Weekly Notes, 1895, p. 18). Insurance companies have, however, frequently begun to restrict the conditions as much as possible so as to make their policies practically indefeasible.

The competition between insurance companies has also produced a great many variations in the scheme of assurance intended to attract customers. It is usual from time to time to grant additions to the sums insured, dependent upon the profits of the company as ascertained on the taking of the periodical valuations. Persons who are willing to forfeit the chance of such bonuses can insure at lower premiums ; or the ordinary premium is paid at the commencement, and a reduction corresponding to the bonus is made whenever bonuses are declared. Some companies also accept reduced premiums at the commencement, so as to attract persons with small but increasing incomes. Persons who do not like to be burdened with the payment of the premiums during the whole of their life may also, by paying a higher premium at the beginning, secure a certain sum on death by the payment of a limited number of premiums. Thus a person aged 25 may insure the payment of £100 on his death by making 10 annual payments of £4 : 7s., or 15 of £3 : 4 : 6, or 20 of £2 : 13 : 8, or 25 of £2 : 7 : 6.[1] A person who is desirous of terminating his payments need not forfeit his policy if he has paid the premiums during a certain number of years (2 or 3 years as a general rule), but he may, on giving notice in proper time, receive an immediate cash payment which is called the "surrender value," or he may receive a "fully-paid policy" for a sum payable at his death. Insurance companies do not generally state the surrender values beforehand, but they frequently guarantee a minimum surrender value, *e.g.* one third of the total premiums paid, and as a rule, pay much higher sums than the guaranteed minima. Thus one company, in the case of a person entered at the age of 30, now allows for a policy for £100, the annual premium being £2 : 9 : 4, the sum of £4 : 3s. after 5 years ; £8 : 19s. after 10 years ; £21 : 7s. after 20 years ; £36 : 17s. after 30 years ; £53 : 12s. after 40 years. The same company guarantees fully-paid policies for an amount equal to the aggregate of the premiums paid. Policies are also frequently granted for securing sums payable at certain ages or on death, if the insured dies before reaching the age. These assurances which are called endowment assurances are useful for several purposes. Thus, a father who wishes to secure a certain sum for the advancement of a child in life, may do so by paying a corresponding annual sum. In the event of the child's death before attaining 21, the company retains the premiums, but it may also be arranged that the premiums are to be returned, in which case they are of course higher. Thus, an annual premium of £3 : 1 : 8 paid from the birth of the child, will secure the payment of £100 on such child attaining the age of 21 ; but if the return of the premiums on death is stipulated for, the premium is raised to £3 : 10 : 4 annually. Another purpose for which endowment insurances are taken out is to provide for retirement from a profitable occupation at a certain age. It is possible for a person 30 years old to secure the payment of £100 on reaching 60 years, by paying an annual sum of £3 : 7 : 6 ; if the payment is to be made on attaining 65 years, the premium is reduced to £2 : 19 : 6.

[1] The figures here given are taken from the tables of various insurance companies, and each case of course applies to the company only from whose tables they have been taken, but they illustrate the general principle.

In case of death before attaining the age in question, the £100 are paid in either case. It is also possible to secure an annual sum payable from a certain age during life by paying an annual premium up to the time of reaching that age. Thus a person aged 30, by paying an annual sum of £2 : 1 : 7, may secure an annuity of £10 payable from the time of his reaching the age of 60 during his life ; and if the annuity is to commence when the insured reaches 65 the premium is reduced to £1 : 8s.

The ordinary annuity business of an insurance company enables a person, by paying a lump sum, to secure a yearly income during life, either immediately or from some later date, —this is called a deferred annuity. This annuity business is in reality the exact opposite of the life insurance business ; a person insuring his life deprives himself of income in order to increase his estate on his death, whilst an annuitant reduces his estate on his death in order to increase his income. The annuity business is also a sort of protection to insurance companies inasmuch as a miscalculation in the tables of mortality which would produce a loss in one department would produce a corresponding gain in the other. Insurance companies have also provided means for facilitating the payment of estate duties. These duties being payable before probate can be granted, cannot, in the first instance, be paid out of the estate of the deceased ; the difficulty is overcome by the insurance company, in return for an annual premium, undertaking to pay estate duty up to a certain amount, which amount is paid direct to the revenue authorities, and can therefore be paid without risk to the company, although the authority of the personal representatives has not as yet been definitely confirmed by probate. There are many other ways in which insurance companies have tried to meet the various contingencies and risks of pecuniary loss which may occur, and new methods are constantly invented to do this in a more efficient and economical way.

The solidity and solvency of insurance companies generally, notwithstanding the complicated nature of their transactions, supply a most convincing testimonial, not only to the prudence and capability of the persons concerned in their management, but also to the truth of the doctrine of probabilities which is the basis of their operations. There is, however, one danger which recent events have made more serious, although it does not seem to have been generally recognised as yet. This is the diminution in the rate of interest in all first-class investments, which of course must materially affect the income whilst not decreasing their expenditure. This makes it all the more necessary to provide some means by which the public can be assured of the solvency of insurance companies. The advertisements which make a large parade of the total sum of the invested funds ought not to be taken for more than what they are worth, their sufficiency depends entirely on the extent of the liabilities, as to which no idea can be formed by anybody except practised experts, and the public cannot attach any importance to statements not certified by such experts. The Life Assurance Companies Acts, 1870-1872, have recognised this want, and provided that every insurance company must, at intervals of at least five years, obtain actuarial reports as to their financial position, and prepare statements as to their life assurance and annuity business on the basis of such report, which report and statement must be submitted to the board of trade. It is also provided that a separate account should be kept of all receipts in respect of life assurance and annuities, and that all such receipts should be carried to a separate fund, which is to be as absolutely the security of the life policyholders and annuitants as though it belonged to a separate company carrying on no other business except life insurance and annuity business. It is also required that revenue accounts and balance-sheets containing a number of prescribed details should be prepared annually and deposited with the board of trade. These balance-sheets must contain a detailed list of the investments under prescribed heads. Insurance companies must also, on starting business, deposit a sum of £20,000, which sum may not be withdrawn until the insurance fund has reached £40,000. Means are thus provided for the public to form their own opinion, but as the least prudent companies are generally the most active in touting for business, occasional losses cannot be prevented, though up to the present they have been comparatively rare.

[See arts. on ANNUITY ; TONTINE. For law of life insurance : see Bunyon, *Law of Life Insurance*, 3rd ed., 1892.—Crawley, *Law of Life Insurance*, 1882.—Porter, *Law of Insurance*, 2nd ed., 1887.]

E. S.

INSURANCE, MARINE. Marine insurance may be defined as a contract whereby the insurer, in consideration of a premium, undertakes to indemnify the assured, in manner and to the extent thereby agreed, against losses caused by perils incidental to marine navigation. The informal note of the contract, which is drawn up when it is entered into, is called the "slip." The formal instrument, which is afterwards drawn up from the slip, is called a "marine policy." The liability of the insurer under his contract is called, as also in the case of other insurance, the "risk."

Though marine insurance is essentially a contract of indemnity, it is not a formally perfect indemnity, because, for example, in the case of

a valued policy, the sum recoverable may exceed the real loss, while, in the case of an unvalued policy, the sum recoverable may fall short of the real loss, as the amount of the loss is then estimated according to certain arbitrary rules. But this depends rather on inveterate adherence to certain traditional forms of policy than on the nature of the contract itself; for the parties may make any stipulation they please.

The peculiar incidents of marine insurance all flow logically from its character as a contract of indemnity. In the first place it is a contract *uberrimæ fidei*. Hence each party must spontaneously disclose to the other all facts relating to the adventure which are not within the actual or presumed knowledge of the other party. In the second place the assured must have a pecuniary interest in the subject-matter insured, otherwise insurance would degenerate from a contract of indemnity into a mere gaming contract. Thirdly, when the insurer pays on the footing of a total loss, the right of subrogation accrues to him, that is to say, he acquires all rights and remedies of the assured in respect to anything that may remain of the subject-matter insured. Moreover, if the assured elects to treat a constructive total loss as an actual total loss, he can only do so by giving notice of abandonment to the insurer, if there be anything of value to abandon. Fourthly, if the subject matter insured has never been imperilled, or if for any other reason, not due to the fault of the assured, the risk has never attached, the assured is entitled to a return of the premium.

[Arnould on *Marine Insurance*, 6th ed., and M'Arthur on *Marine Insurance*, 2nd ed. See AVERAGE (MARITIME); BOTTOMRY, LOAN ON.]

M. D. C.

INSURANCE, MUTUAL. Life and fire insurance are sometimes carried on by companies formed on a mutual principle. Marine insurance, ordinarily and in its origin, is a contract whereby one person, in consideration of a premium, undertakes to indemnify another person against the losses incidental to marine navigation. But a custom has sprung up in modern times whereby associations of ship-owners become their own insurers. The members of the association mutually guarantee each other against marine losses. If the members number more than twenty, they must register under the Companies Acts in order to constitute a legal body. The individual guarantees take the place of the premium, and the details of the contract are of course subject to the rules and regulations of the particular association. Subject to these qualifications a contract of mutual insurance is on the same legal footing as an ordinary contract of insurance with an underwriter or insurance company (see *Arnould on Marine Insurance*, ed. 6, p. 152). M. D. C.

INSURANCE, STATE (GERMANY).—*History*. The compulsory state insurance of Germany grew naturally out of philosophic conceptions of the state that date from the early years of this century. In the voluminous discussion which preceded the sickness and accident laws, in imperial rescripts, in several of Prince Bismarck's speeches, in the *Begründung* of the accident law, we find the idea constantly repeated that the state has wide and various, as well as definite and positive, Christian duties, especially toward the weaker members of society. No one doubts LASSALLE'S influence in shaping much social legislation in Germany. He has told us what he owes to two books of FICHTE, one written in 1796, the other in 1800. SISMONDI'S work published in 1819 is frequently quoted by those who acted most powerfully upon the preliminary discussion out of which the laws sprang. Sismondi returned from a journey among French manufacturing centres with the same feelings that made Karl Marlo a socialist. Sismondi wrote, "Nous regardons le gouvernement comme devant être le protecteur du faible contre le fort," etc. When Prof. Winkelblech (Karl Marlo) came back from his journey, he not only wrote passionately in this same spirit, but he conceived and clearly expressed the thought of a remedy in universal compulsory insurance. In his *Organisation der Arbeit* (probably written before 1850), vol. ii. p. 328 *et seq.*, he maintains, in a criticism of the liberal school, that no remedy for social evils is adequate save obligatory insurance. Dr. Schaeffle, who is often called the father of this system, was influenced directly and powerfully by Winkelblech.

Even before the Franco-Prussian war the thought which was later elaborated in *Der Korporation-Hülfskassenzwang* appears to have occurred to Schaeffle. Both the theory of the state and the theory of compulsory insurance were therefore waiting upon occasion before the legislation came. After the founding of the *Verein für Socialpolitik* in 1872, the idea of the insurance scheme was kept before the public mind, especially through writings of Wagner, Schmoller, and other *Kathedersocialisten*. Feb. 12, 1879, came the first imperial word from the throne. Another followed in Feb. 1881, and in Nov. of the same year the imperial message was sent forth. From 1874 the extraordinary growth of the social democracy had also influenced many of the conservatives to seek a remedy in compulsory insurance. To this end an agitation was begun in the Reichstag 1878. The ministry of 1879 announced "the government accepts the theory that the working man who has become incapacitated through age or in consequence of his work should not be a burden upon the public," etc. The two attempts upon the emperor's life in 1878, while they led to strong repressive measures against the socialists, gave rise also to positive reforms. At the opening of the Reichstag in 1879 the emperor referred directly to the anti-socialist

law, adding an earnest wish that the house would co-operate in a series of positive social reforms initiated by the state. This historic relation to socialism is of signal importance in any attempt to appreciate or criticise this legislation.

Insurance against Sickness.—The first law (against sickness) passed by a powerful majority June 15, 1883. Sick funds or associations already centuries old were taken as a basis. These older *Knappschaftskassen* were even compulsory among Prussian miners as early as 1854. The law of 1883 makes this compulsion universal. To give elasticity and freedom seven forms of associations are established.

(1) Local sick fund, managed by townships for different branches of trade. (2) Factory funds. (3) Building funds. (4) Mining funds. (5) Trade or gild funds. (6) Free funds that may be managed with greater independence, being only obliged to do at least as much for the labourer as the law prescribes. (7) Communal fund, including those who do not fall under either of the above funds. Both payments and receipts under these seven associations differ in details. The law does not fix any weekly amounts, it is left to each insurance office to fix them, see § 20 of the law. Generally the sick receive relief during 13 weeks—(1) for medical treatment, including medicines and appliances, (2) in case of complete disability, at least one half the average wage of the place in which he works. As a precaution the pay begins on the third day of sickness. The sick may be taken to a hospital and half his wage given to those dependent upon him. (3) An amount at death for burial expenses equal to twenty days' wage. (4) Women at time of childbirth are supported during three weeks. This insurance is supposed to represent a money value very nearly $\frac{2}{3}$ the average wage. The labourer himself pays $\frac{2}{3}$ and the employer $\frac{1}{3}$ of the amount, although, as in the old age and invalidity law, many employers pay both contributions, thus adding directly to the wage. Recent statistics show nearly 8,000,000 insured, and more than 100,000,000 marks go yearly to sick relief alone. It is estimated that the employer pays 3·69 marks *per insured;* the employed, 10·09 marks; that the relief averages 11·77; the management and costs, 0·81 marks; and the funds, 9·72. Sickness averages 15·7 days at an expense of 32·41 marks. The relief per 100 insured (sick persons), male 37·4 marks, female 31·8, total 36·3. Relief per 100 marks for sick pay, 47·91; doctor, 19·97; medicine, 16·04; hospital, 10·49; burial, 4·28; childbed, 1·31.

The law against *Accidents* passed 6th July 1884, came into operation 1st October 1885. Several amendments extend the principle practically to the entire wage-earning class, a part of this amount to the injured and to his survivors. Both sick and accident laws will eventually insure nearly 17,000,000 of people. The proposed extension of the law to widows, orphans, and house industry will come into effect as early as practicable. Even if the sickness is caused by accident, the sick fund must bear the burden until the beginning of the fourteenth week. This throws a large proportion of lesser hurts wholly on to the sick funds. Help is rendered under the accident law even if the accident is caused by sheer negligence of the labourer. Wilful self-injury alone is excepted. The responsibility of insuring the labourer is wholly with the employer. The simple fact that one is a wage-earner alone constitutes one a member of an insurance society. Small officials with salary below 2000 marks (£100) yearly are included. The pecuniary burden also is thrown wholly on the employers. The principle of *le risque professionnel* is fully accepted, it being supposed that employers, under such definite responsibility, would guard against accident costs for which they alone have to pay.[1] The management is through trade associations of employers with mutual liability. Premiums are based upon wages, and are determined yearly by estimates of wage or salary during the previous year, and also upon the extent and kind of risk to which the given trade subjects the labourer. Elaborate schedules of danger are used to determine the risks in the different industries. From the end of the thirteenth week of incapacity the injured receives (paid through the post office) while absent from work, two-thirds his usual wage. If only partly incapacitated medical attendance is supplied, and in case of death, a sum equal to twenty times the daily wage goes to the family for funeral expenses, and an annuity to the widow; one-fifth of the husband's earnings to each child till the fifteenth year, 15 per cent of such earnings, or one-fifth, if the child is motherless. The entire annuity may in no case exceed three-fifths of the father's earnings. A board of arbitration composed of employers and representatives decide disputed questions, the imperial insurance bureau in all cases having final judgment. This higher commission is composed of three permanent members including the chairman. These are appointed from proposals of the Bundesrath, by the emperor, and hold office for life. Four non-permanent members are chosen by the Bundesrath, two by the trade associations, and

[1] Of the delicate question of personal responsibility for accidents, it should be said that an employer who causes an accident, even by negligence, is liable to the injured for an *excess* of the award above what the law gives. They must be responsible to the trade association, or sick fund, which pays in first instance, for the *full* amount. Other persons are liable for the whole damage. The various charitable unions have still the same duties as before, though their expenses may be paid by the trade association. So that compensation for industrial injuries becomes a certainty. The certainty is of a nature that has almost wholly done away with the constant litigation under the employers' liability law of 1871, and is considered in this respect throughout Germany an improvement of first importance.

two by representatives of the workmen. The non-permanent members hold office four years. The imperial bureau can command books, witnesses, correspondence, and all documents necessary to the decision of any question in dispute. The expenses of this bureau are borne by the empire. Its accounts are laid yearly before the Reichstag. In 1890 there were 64 industrial trade associations, and 48 agricultural associations. These include 390,622 trades classed as industrial, with 4,843,621 separate agricultural interests, 4,926,672 and 8,088,698 persons are included in these respective interests, *i.e.* above 5,000,000 of businesses (Betriebe) with more than 12,000,000 of insured persons. The entire outgo of these associations exceeds 36,000,000 marks with reserve funds of 55,000,000. The law was extended to the carrying traffic in May 1885. Here the empire or the state has direct control instead of the trade association. The extension of the law (15th March 1886) to military officers and soldiers has rather to do with pension than insurance legislation. May 5, 1886, the law was applied to agriculture and forestry, in which the work is of such uniform character that the institutions could conform to state, provincial, or county lines. Calculations are not here made upon the wages of the injured but upon an average rate of agricultural wages. Direct taxes like the land tax may be made the basis of assessment. The building and marine accident law passed in 1887. The most important change here is that, in the "deep building"[1] a single trade association for the empire was formed, and the method by assessment gave place to a charge on capital[2] (Umlageverfahren durch Kapitaldeckungsverfahren). To estimate results properly, it should be seen that the lighter accidents—nearly 90 per cent—come under the sick law. [The labourers really contribute to the *accident* fund *inversely* to the employers' contribution to the *sick* fund, *i.e.* the labourers bear 11 per cent of the accident burdens while the employers bear 33⅓ per cent of the sick-fund burdens. These facts gave the basis for common representation upon the arbitration of both employer and employed.] The cost per accident is about 200 marks. Compensation per 100 marks 68·66 marks to the injured, 21·35 to survivors, 8·61 for cure, 1·38 for burial. In 1890 the employers paid, per person insured, 2·98 marks, expenses of compensation, 1·40, management, 0·40, funds, 5·52. It is significant that the most skilled physicians are more and more called for all serious cases. This is unquestionably setting a higher standard of health restoration both in cities and country. Fifty-six of the sixty-four trade associations have already adopted measures of *prevention* against accidents. It has been found that the best skill and elaborate preventive methods pay in the long run.

The last law—invalidity and old age—dates from 22nd June 1889. It was early conceived to be necessary for the completion of the scheme, The two previous laws passed with strong majorities, the last with a small hesitating one. Its first distinction from the other laws is that it applies not to any special business or branches of any trade, but to the whole mass of the "working population," so long as wages do not reach £100 yearly. At least 12,000,000 of workers will fall under this form of insurance. Beginning with the sixteenth year, men and women are classified according to their wages in four different classes.

Class 1, up to 350 marks yearly, for which 14 pfennigs are paid weekly.
Class 2, up to 550 marks yearly, for which 20 pfennigs are paid weekly.
Class 3, up to 850 marks yearly, for which 24 pfennigs are paid weekly.
Class 4, above 850 marks yearly, for which 30 pfennigs are paid weekly.

As payments are not made when the insured is out of work (unless from free choice) only forty-seven weeks are "paying time" in the year. This allows for sickness and idle time.

The contributions during the year (forty-seven weeks) would thus amount to—

3s. 3½d.	for	class	1st.
4s. 8½d.	,,	,,	2nd.
5s. 7½d.	,,	,,	3rd.
7s.	,,	,,	4th.

These payments are made half by employers, half by the labourers, the state adding to each paid annuity a yearly subsidy of 50 marks. The annuity is due at the completion of the seventieth year. It is distinctly the purpose of this law to give only enough to guard the insured against actual suffering. It is paid, however, even if the insured is earning full wages. Thirty years of contribution ($47 \times 30 = 1410$ weeks) give claim to the pension. If no time is lost, twenty-seven years suffice to secure the annuity. No separate contributions are necessary for the old-age pension, as this is covered by the invalid insurance claims. If one who is drawing old-age pension secures invalid pension, the former is discontinued. All who have contributed five years, and are permanently disabled, receive the invalid pension at whatever age the disability falls. If an accident disable him, he draws invalid pension, only in case he does not fall under the accident law. "Invalidism," under the third law, is supposed to cover only permanent disablement. This dis-

[1] "Tiefbau" is the building of bridges etc. as distinguished from houses "hochbau."

[2] The expression "charge on capital" requires some explanation. The difference between "Umlageverfahren" and "Kapitaldeckungsverfahren" is this:—According to the first-named system assessments are made in each year to cover the losses of the previous year. According to the second system (which is the ordinary insurance system), fixed premiums are paid out of which reserve funds are formed for the payment of losses.

ability is defined as unfitness to earn one-fourth the usual wage. If thereafter the labourer becomes able to earn more than this sum, his payments may be in part or wholly withdrawn. It is estimated that ten times as many persons will draw invalid pensions as those that draw old-age pensions. It is expected that eventually a sum of 250,000,000 of marks yearly will go alone for invalid pensions. The annuities from incapacity are reckoned on a basis of sixty marks, increasing in proportion to the contribution.

Class (1)	350 marks	2 pfgs. ($8\frac{1}{3}$ pfngs. = 1d.)
,, (2)	550 ,,	6 ,,
,, (3)	850 ,,	9 ,,
,, (4)	850+,,	13 ,,

One who had for example made 100 payments in class (1), or 100×2 pfg. = 200 pfgs. ; 150 payments in class (2), or 150×6 pfg. = 900 pfgs. ; 50 payments in class (3), or 50×9 pfg. = 450 pfgs. ; 300 payments in class (4), 300×13 pfg. = 3900 pfgs.

Here the insured who had paid during the 600 weeks would receive $2{\cdot}00 + 9{\cdot}00 + 4{\cdot}50 + 39{\cdot}00 =$ m. $54{\cdot}50$. The state adds 50 m. The minimum basal annuity is 60 m. If he had had 40 weeks' sickness and served 10 weeks of military duty, for which time the state pays, we have the following result to add to the above 600 weeks' payment in the four classes.

	Marks
1. By the state	50·00
2. Basal annuity	60·00
3. Affixed stamps in the 4 classes during 600 weeks . .	54·50
40 weeks' sickness 40×6 [1] . .	2·40
Military service 10×6 . . .	0·60
	167·50

This amount (167·50 marks) represents the invalid pension, which may at any time, and in any case, be reckoned simply as above shown.

To secure the old-age pension, contributions must have been made thirty years (30×47). As this would have caused great injustice to those approaching the seventieth year, it was decided to give the pension earlier to those who, at the time the law took effect, had passed the fortieth year of age. One, for example, who had in 1891 reached the age of forty-seven, would have, instead of 30×47, only 23×47 weeks to contribute, *i.e.* his years for contributing would be lessened by as many as he had already passed the fortieth year. One who was nearly seventy would have only to show that he had worked regularly 141 weeks before the law came into effect in 1891.

Here the 1st wage class has a pension of			4 pfg.
,,	2nd	,, ,,	6 ,,
,,	3rd	,, ,,	8 ,,
,,	4th	,, ,,	10 ,,

If a man completing his seventieth year has paid during 1800 weeks (500 in 1st class, 400 in 3rd class, 900 in 4th class), and had been sick 50 weeks, and served 40 weeks as soldier (or 90 weeks under 2nd class), his account would stand as follows :—

900	in IV. Class
400	,, III. ,,
90	,, II. ,,
20	,, I. ,,
1410	weeks.

or the exact number of weeks the law demands. As only 1410 are required, 480 of the 500 in 1st class are omitted.

We have thus—

		Marks
(1)	State payment	= 50·00
(2)	900 ,, IV. class at 10 pfg.	= 90·00
(3)	400 ,, III. ,, 8 ,,	= 32·00
(4)	90 ,, II. ,, 6 ,,	= 5·40
(5)	20 ,, I. ,, 4 ,,	= 0·80
		178·20

as the pension.

In case of any sickness so serious as to make permanent disability probable, the insurance authorities may secure such extra medical attention as they see fit, though the insured can make no such claim. The payments are made in stamps, to be had at every post office. The stamps are affixed to a card containing fifty-two spaces. The cost of the stamps is 14, 20, 24, and 30 pfg., according to the wages received. These payments are made by the master, who is supposed to deduct one half the sum from the weekly wage. As a fact it is more and more common for the employer to pay the whole for the more personal service, as the deduction is found to create dissatisfaction, especially with the servant class. In Baden the "sticking," which has caused so much unpleasantness in Germany, is done by the officials. The employer pays, to an official who calls at the door, a lump sum. When the card is filled, a record of it is made at the office, and a new one issued, so marked as to show where the previous card may be found. To women who marry half the sum of their actual contribution is restored without interest, and to the widows and dependants of men who die before receiving the pension, provided contributions have been made for at least five years. The actual burden to the state of paying for time of military service, and for its officials, is estimated at 8,000,000 marks yearly. This does not include the extra burden upon the post office, nor the vast service that is rendered without compensation. It is claimed that the costs have not thus far risen above the estimates. In 1891, 132,917 claims for old-age pensions were allowed costing 16·63 millions of marks; 6·65 millions fell to the government's share. The average pension was 125·08 marks.

The advantages to the labourers are said to be far greater than any which private companies

[1] Time of sickness and military service is reckoned as in second class, *i.e.* 6 pfgs.

could give, as the insured get the state subsidy and the contributions of employers without cost to themselves. After five years of contributions, the yearly invalidity pension is five and a half times greater than all the contributions of the insured. In the first year (1891) 132,917 annuities were given (15,306,754 marks), and nearly 100,000,000 marks received for stamps.

When the "stability stage," *Beharrungszustand*, is reached, about 1,500,000 persons, in a population of 50,000,000, will receive benefits equal to 330,000,000 marks annuities (£16,500,000). The three laws together will eventually distribute annually about 500,000,000 marks (£25,000,000).

[See *Special Report Commissioner of Labour*, U.S.A., 1894, by John Graham Brooks. Two Bills which are intended to effect the compulsory insurance of the great bulk of the wage-earning classes of Switzerland against sickness and accident have been lately issued, Sept. 1895.] J. G. B.

INSURANCE AGAINST SICKNESS. See INSURANCE, STATE.

INSURANCE THEORY IN TAXATION. See TAXATION.

INTEGRAL AND DIFFERENTIAL CALCULUS. The integral calculus provides a method of great importance in all branches of science which require the aid of mathematics, enabling us to deal satisfactorily with variable quantities, such as are far beyond the reach of the ordinary methods of arithmetic and algebra. Its object is to provide a means of adding together quantities which are so small as to be individually imperceptible, but so numerous that their sum is a perceptible quantity. This can only be done in one class of cases, where the quantities are the small increments by which a variable quantity increases from moment to moment. The method of procedure is to compare the small increments of an unknown quantity with small increments of a quantity upon which the changes of the first quantity depend. The change resulting from the united effect of these small increments can then be deduced from the known quantity by the process of *integration*, which is, as its name implies, the fundamental operation of the calculus, thus:— Let x and y be two variable quantities, which are not independent, so that if x varies y must vary also. Let x change to $x+\Delta x$ (where Δx denotes a small increase in the value of x) and y in consequence changes to $y+\Delta y$; then the increase of y is to the increase of x in the ratio $\Delta y : \Delta x$. Now the differential calculus tells us that when Δy and Δx are sufficiently diminished, the fraction $\Delta y/\Delta x$ approaches a definite limit which can always be found, and is denoted by the expression dy/dx: this expression is called the differential coefficient of y with respect to x, and the finding of it is the fundamental operation of the differential calculus. If, then, we know the ratio L of a small increment of an unknown quantity y to the corresponding increment of a known quantity x, in the notation of the differential calculus $dy/dx = \mathrm{L}$. In the notation of the integral calculus $\int_{x_0}^{x_1} \mathrm{L}\ dx$ measures the amount by which Y has increased while x has changed from x_0 to x_1; x_0 and x_1 are called the limits of the integral. Suppose we know the value of y, say b, corresponding to any particular value, say a, of x, then $y = b + \int_a^x \mathrm{L}\ dx$ gives the general value of y in terms of x. The symbol $\int$ was originally an S standing for sum; $\int \mathrm{L}\ dx$ meant the sum of the quantities obtained by multiplying the increments of x by the variable quantity L.

The differential calculus provides a method of comparing quantities which are so small as to be individually imperceptible, but bear to each other a finite ratio. *Differentiation* is the process of finding this ratio when the small quantities are the increments by which two quantities, whose variations are mutually dependent, increase from moment to moment. Suppose the magnitude of a variable quantity y depends upon that of another variable x: then y is called a function of x. If x be increased by a small quantity Δx, y will be increased correspondingly by a small quantity Δy. The fraction $\Delta y/\Delta x$, as Δx is continually diminished, approaches a certain definite limit denoted by dy/dx and called the differential coefficient of y with respect to x. Of course the quantity dy/dx is a function of x, so that it can be treated in the same way as y has been: the expression $d(dy/dx)/dx$ or d^2y/dx^2 is called the second differential coefficient of y with respect to x. This process may be continued *ad infinitum*. It is as an introduction to the higher branches of mathematics that the differential calculus is valuable; while it can very seldom be employed alone for the direct elucidation of a problem, without it, higher mathematics could not be employed at all.

The following example is taken from Marshall's *Principles of Economics*, vol. i. appendix note 1. Let h be a pleasure of which the probability is p, and which will occur if at all at a time distant t: let r be the rate of interest per unit, which must be added to present pleasures before comparing them to future, and let $\mathrm{R} = 1 + r$; then the present value of the pleasure is $ph\ \mathrm{R}^{-t}$. If ω be the probability that a person will derive an element of happiness Δh, from the possession of say a piano in the element of time Δt, then the present value of the piano to him is $\int^t \omega \mathrm{R}\ \frac{dh}{dt}\ dt$. If we are to include all the happiness that results from the event at whatever distance of time, we must make the upper limit of the integral infinity. The same

appendix contains many examples of the use of the calculus in economic reasoning.

[The ordinary text books in use are those of Todhunter, Williamson, and Edwards, on the *Differential*, and Todhunter and Williamson on the *Integral* calculus.—Greenhill, *Differential and Integral Calculus*, gives a very rapid insight into the methods and capabilities of the calculus, but is very difficult.—Wicksteed, *Alphabet of Economic Science*.] A. E. S.

INTENSIVE CULTIVATION means the cultivation of the soil by agriculturists who use artificial means to increase its natural fertility. It is the only practicable method of cultivating a fixed plot of land, and it is the opposite of the "extensive" cultivation of nomad farmers who "arva per annos mutant et superest ager," Tacitus, *Germ.* 26 (comp. Horace, *O.*, III. xxiv. 14; Cæsar, *B. G.*, iv. 1; Marshall's abstract of the reports to the Board of Agriculture, Midlands, p. 17), or where each, like the Yorkshire farmer a century ago, "every year . . . ploughs up a fresh part of his sheepwalk to take a crop or two, and then lets it lie fifteen or twenty years" (A. Young's *Northern Tour*, ii. 14). Pastoral methods leaven unscientific agriculture. The application of science, at first to prevent exhaustion of the soil, characterises non-nomad or intensive agriculture. This expression accordingly means scientific cultivation.

Scientific cultivation includes—(1) the rotation of crops on a double, triple, or quadruple system. The double system is described in Virgil's *Georgics*, i. 73, and in A. Young's *Political Essays*, p. 153. The latter writes (1772), "It is in some parts of England, and in many of France, the practice to divide a farm into two parts; half every year sown with wheat and the other half fallow." This double or convertible system only differs in degree from that of the Yorkshire farmer referred to. The triple system was introduced into England in Henry III.'s reign, the quadruple by Lord Townshend last century (Prothero's *Pioneers and Progress of English Farming*, pp. 4, 42). (2) Drainage had its first scientific English exponent in 1649, its latest in 1834 (*ib.* pp. 97, 249). (3) Spade husbandry was advocated by Sir H. Platte, "author of *Adam's Arts Revived*" ("*Compleat Husbandman*," S. Hartlib, p. 6), in 1601. (4) As for manuring, marling, and liming, the first was an incident of mediæval villein tenures, the last two are devices of peculiarly English origin (Fitzherbert's *Book of Husbandry*, ed. Skeat, p. 134; cp. Sir R. Weston's "We have lime and marl of which they know not the use," *Brabant Husbandry*, p. 4). (5) Bones were introduced in 1772, and their use soon made general by Coke of Holkham. (6) Nitrates date from 1839; then came guano; then machinery. Discoveries have ceased since 1851, according to Sir J. Caird (Ward's *Reign of Queen Victoria*, vol. ii.). As for results, Sir J. Lawes's experiments at Rothamsted, annually detailed in the *Royal Agricultural Journal*, show how wheat can be grown for fifty consecutive years (cp. Prout's *Profitable Clay-farming*), and that properly-dressed grass-land yields two or three times as much as undressed grass-land (Caird's *Landed Interest*, pp. 24 and 39), agricultural thus in its turn reacting on and leavening pastoral methods.

Political economists base upon intensive cultivation—(1) a justification of property in land. These processes, they say, "alter" land, make the useless useful, and increase land qualitatively if not quantitatively, thus making it like any other commodity (Mill's *Pol. Econ.*, ii. 2, 5; Laveleye's *Primitive Property*). (2) Or they argue for security to the capitalist-cultivator: thus improving-leases of twenty-one years were recommended by Sir R. Weston in the 17th, Lord Townshend and Mr. Coke in the 18th century, and now by Sir J. Caird on these grounds. (3) Those who advocate peasant proprietorship as the best stimulus for intensive cultivation, quote A. Young's "the magic of property turns sand to gold"; "give a man secure possession of a bleak rock and he will turn it into a garden; give him a nine years' lease of a garden and he will convert it into a desert" (*Travels in France, 1787, 30th July, 7th November*)—remarks elicited from a partizan witness by the effects of peasant proprietorship in Flanders. (4) Intensive cultivation doubtless illustrates the law of diminishing or limited returns (see J. H. Hollander, The Concept of Marginal Rent, *Quart. Jour. of Econs.* Jan. 1895; S. N. Patten's *Premisses of Pol. Econ.*, ch. vi.; and Sidgwick's *Pol. Econ.*, bk. ii. ch. vii., note); and the principle of specialising growth to soil illustrates an opposite tendency (Carey's *Principles of Social Science*, i. 106, 107; cp. Mill's *Pol. Econ.*, bk. i. ch. xii. 3). The first should not therefore be pursued to the exclusion of the second principle—this is probably the meaning of Mr. Prothero's "Agriculture cannot hold its own by intension against extension" (p. 123). Sir J. Caird, however, discusses a case in which reliance would and could be placed on the first as a temporary substitute for the second principle, viz. supposing war cut us off from foreign supplies (*Landed Interest*, pp. 19 and 20).

J. D. R.

INTERCURSUS MAGNUS, or (Treaty of) Great Intercourse, was the name given by contemporaries to the treaty of 1496 between Henry VII. and the Archduke Philip, re-establishing trading relations between England and the Netherlands. It indicates no fundamental change of policy on either side, and did little more than restore earlier conditions and customs. The joy with which it was received, and the

designation given to it, are to be explained by the fact that, owing to the support given to Perkin Warbeck by the Duchess Margaret, trade between the two countries had been suspended for two years. To the English weavers the market for their cloth furnished by the Netherlands was already valuable, while the Netherlands needed English wool and the privilege of fishing in English waters, so that the suspension of intercourse caused great distress on both sides.

[Schanz, *Englische Handelspolitik* (1881), ch. i. —The text of the *Tractatus Pacis et Intercursus Burgundiæ* is in Rymer, *Fœdera* (2nd ed. 1727), xii. 578 *seq.*] W. J. A.

INTERCURSUS MALUS, or (Treaty of) Evil Intercourse, was the name given by the Netherlanders to the treaty of 1506 between Henry VII. and the Archduke Philip, by which trade was re-established between England and the Netherlands on more favourable terms for the former, after a temporary suspension due to political complications.

In future English merchants were to be allowed to sell their cloth in the Netherlands in both large and small quantities, and no penalties were to be imposed upon the purchasers. The carrying out of this treaty would have seriously affected the woollen manufactures of the Netherlands, and the Archduke had probably only been compelled to accept it by the tempest which cast him upon the English shores. The treaty was never confirmed; and, although a new treaty was signed in 1507, Henry was obliged to abandon his claim so far as it concerned English cloth.

[Schanz, *Englische Handelspolitik* (1881), ch. i.—The text of the treaty is in Rymer, *Fœdera* (2nd ed. 1727), xiii. 132.] W. J. A.

INTERDICT (Scots law term). Equivalent to prohibitory injunction. A. D.

INTERDICTIO AQUÆ ET IGNIS, the ordinary form of Roman banishment under the republican constitution of the Roman state. It was carried into effect by a decree of the people being passed declaring a person to be in exile, and prohibiting every one from supplying him with fire and water so as to prevent his return. Fire and water were the symbols of religious purity, —to deprive a citizen of these was to cut him off from all communion with the state, and so to free it from the contamination of his guilt. Such banishment was accompanied by loss of citizenship.

[Smith's *Dict. of Antiq.*, *s.v.*] E. A. W.

INTERDICTION. There is a procedure in the law of all countries by which persons suffering from certain diseases or propensities (weakness of intellect, insanity, idiocy, etc.) may be subjected to all or some of the incapacities to which infants are subjected under the general law. This procedure, in Scotland as well as in French-speaking countries, is called "interdiction." The Italian term is "Interdizione"; in German-speaking countries the term "Entmündigung" is used. The same or a similar procedure may, in Scotland as well as in all continental countries, be also used in the case of persons of wasteful or extravagant disposition, if their relatives have reason to fear that they would, if unchecked, waste their property. The disabilities which may be attached to prodigals are not, however, identical in all cases with the disabilities to which persons of unsound mind are subjected. Thus in France prodigals are not subject to "interdiction" in the ordinary sense, but they may be prohibited from entering into certain transactions without the concurrence of a person appointed by the court, who is called "conseil judiciaire" (see Code Civil, art. 513), and a similar rule applies to all interdicted persons in Scotland, there being a special procedure for persons of unsound mind in the strict sense. In Scotland there is also a "voluntary interdiction," which enables a person to protect himself from his own weakness of intellect or facility of disposition.

The fact that England and the countries deriving their law from England do not recognise the right of any person to prevent the extravagance of a relative by judicial proceedings, is closely connected with the other fact that the law of the same countries allows persons to dispose of the whole of their property by gifts *inter vivos* or by will without considering their issue or other relatives, whilst in Scotland, as well as in continental countries, the wife or husband and the descendants, at least, are entitled to a certain portion of the property, which cannot be taken away by gift or will. According to the view of Scots and continental law, the head of a family is more in the position of a trustee than of an absolute owner; in England this is not so as a matter of law, but the universal use of family settlements shows that, after all, the Scots and continental law is in accordance with the natural disposition of mankind. E. S.

INTERDICTION (Scots law). Restraint directed against extravagant management of real estate by persons liable to be imposed upon may be by a voluntary bond not to do anything which may affect heritable estate without the consent of persons named in the bond, called "interdictors." Or it may be judicial, imposed by authority of the Court of Session, sometimes at the instance of near relatives, occasionally at its own hand. The interdiction is published by being registered in the General Register of Inhibitions, Edinburgh; and it then operates to render voidable any dealings with the realty only, except such as shall have been effected with the consent of the interdictors, or such as may be onerous (for adequate consideration) or rational (reasonable). The person interdicted may even himself raise

an action to have his improper transaction annulled. A. D.

INTERDICTUM was a formal order of a Roman magistrate commanding the party to whom it was addressed to do or abstain from doing something. In many ways it corresponds to the interdict of Scots law, and to some extent to the injunction of English law.

INTERESSE TERMINI. The interest that a tenant at common law has in a lease granted to him before he enters on the premises. A lease at common law is regarded before entry as a contract only; after entry the tenant takes an interest in the land.

INTEREST.

Theory of, p. 426; Interest and Usury, p. 429

THEORY OF. Interest is the name given to that which is paid for the use of a loan. This payment often includes elements of a nature different from that which is strictly called interest. If there be any probability that the loan will not be repaid, the borrower will be compelled to add something to his offer in order to induce the lender to risk his capital. Often, too, what goes under the name of interest includes the allowances which must be made for the maintenance of the full value of capital subject to wear and tear. These allowances for depreciation and risk being made, and duly subtracted from the *gross interest*, there remains the *net interest*, the pure payment for the use of the loan apart from contingent risks, etc.

It is not proposed here to review the various theories which have been advanced to account for the existence of interest. For a review of these in detail the reader may be referred to E. von Böhm-Bawerk's *Geschichte und Kritik der Kapitalzins-Theorien* (translated under title *Capital and Interest*, by Professor W. Smart), where they are one by one examined for the purpose of showing that they are unsatisfactory, preparatory to the enunciation of Professor von Böhm-Bawerk's own theory. We shall merely give here the principal heads of the classification adopted in *Capital and Interest*. These are as follows:

Productivity theories. Interest is the price of the productive services of capital. Malthus, J. B. Say, Von Thünen, Carey, and Leroy-Beaulieu are named as some of the chief exponents of this group of theories.

Use theories. Interest is the price paid for the use of productive capital. The line of division between this and the former group seems far from clear. J. B. Say is named as the founder of the theory, which has been elaborated by German writers in the main, among whom Hermann, Mangoldt, Schäffle, Knies, and Menger are some of the chief names mentioned.

Abstinence theories. Interest is the payment made for abstaining from unproductive use of wealth. The leading exponents of this theory named are Senior, Cairnes, and Cherbuliez.

Labour theories. Interest is the wage of the capitalist's labour, which, in some statements, means the labour which created the capital. The chief exponents of these theories are James Mill, Courcelle-Seneuil, Rodbertus, and Schäffle.

Exploitation theories. Interest arises from the exploitation from the labourer of the wealth which he alone produces. Rodbertus and Marx are the leading supporters of these theories. Besides these principal groups, Turgot's fructification theory, a group denoted *colourless* theories, including, among leading writers, Ricardo, Torrens, M'Culloch, M'Leod, and Rau, and a number of minor, or composite, systems, represented by Molinari, Roscher, Cossa, Jevons, Hoffmann, J. S. Mill, and Henry George among others, are dealt with more briefly.

In rendering an account of interest, we have to account for two phenomena. The first is that it should be necessary to guarantee to lenders not merely the repayment of the principal of the loan, but of a further sum. The second, that borrowers should be willing to pay such additional sums, or, to put the same matter otherwise, that they should prefer to borrow and to repay a sum greater than that borrowed, rather than to abstain from borrowing at all.

It may be said that lenders ask for interest because they know it can be obtained, and that they simply take all they can get. While this is true, it is also true generally that if the payment obtainable by way of (net) interest be increased or decreased owing to any cause whatever, the disposition of lenders to make advances responds to such changes of the conditions of loans; and the amount of capital available to borrowers depends on the terms they are able to offer. In regard to the other side of the question, it is not sufficient to urge that sheer necessity for ready capital accounts sufficiently for the offer of a premium in order to obtain it. This may be quite enough when we consider the case of a spendthrift, or that of an individual who finds himself unexpectedly called upon to meet demands beyond his means, but it does not suffice to account for the deliberate borrowing by merchants and manufacturers for the purpose of extending their business operations, borrowing which they would clearly avoid if it did not promise to yield them a profit over and above the sum paid by way of interest on their loans.

Böhm-Bawerk in his account of the matter dwells on the fact that immediate enjoyment is preferred to a remote though certain enjoyment, precisely equal in all other respects, or, to use more general terms, that present goods are worth more than future goods of equal amount. He deduces the result that the repayment with interest, at the end of the period of the loan, is a payment of a value precisely equal to that borrowed; that, to use an illustration, if the rate of interest be 5 per cent, £105, a year hence, has precisely the same value now as £100 in hand.

To take into account the difference in valuation of present and future goods is doubtless essential in our problem, and it has long been recognised that this is the case. It is, however, hardly sufficient of itself for the complete solution of the problem, and some of the contentions urged in the theories which Professor von Böhm-Bawerk rejects need to be given a place even co-ordinate with that assigned to the substitute which is offered.

In stating the theory, it is necessary to insist on one point, namely, that we are considering the rate of interest on current loans and current investments, that is to say, the rate of *net* interest on present investments either in new or old enterprises. The fact that old investments return to the investors rates either greater or less than the rate actually paid on current loans is discounted by the changes in price of the shares in such enterprises.

We have, in addition to accounting for the willingness of borrowers to pay interest, and for the unwillingness of lenders to make loans without interest, to attempt to render some account of the influences determining the actual rate of interest.

Let us first consider the borrower's side of the question, and consider, not the case of a borrower forced to obtain ready money to meet his engagements, but of a borrower who can choose whether he will borrow or not, and is influenced by the prospect of realising profit or loss on the transaction.

The use of capital in industry, as has been so often pointed out by writers on economics, enables the producer to adopt indirect methods of production in place of direct processes, and these are adopted because, though the product is, by their means, obtained only after considerable delay, its amount is largely increased as compared with what is obtained by processes yielding a more immediate return. From the increased product, besides the wages of labour and the reward of the entrepreneur and the rent of any land used in the process, the capital itself must be replaced, a due allowance be made for the risk involved of complete or partial loss, and we have then left, in general, a sum available for payment of interest. We may conveniently refer to this as the net yield of capital. It is the net amount by which the product is increased through the adoption of the indirect in place of the direct process of production. It must be clear that this net yield is not likely to be identical in all the different avenues open for the investment of capital. In some it will be greater, in some less. Those investments which promise the greater net returns will be sought after in preference to those which can offer only the less. A borrower who is in possession of an opportunity for using capital thus productively will be deterred from increasing his borrowings if the expected returns be less than he must pay for the loan, but stimulated to increase his borrowings in the opposite case.

If we suppose that the amount of capital which can be borrowed is limited, we may also assume that the richer fields for investment are first occupied, and that gradually the poorer opportunities are utilised as far as the capital available will permit. This tacitly assumes that the amount of capital available is limited independently of the rate of return offered. In this case then, the investments would proceed till the available capital was exhausted and the rate of expected net return on the poorest investment actually made would be the rate of interest obtainable on loans, if we suppose all the capital lent at the same rate, for this poorest investment would not be made on our hypothesis if the rate to be paid were greater than the rate which it is anticipated will be earned.

Since the amount of capital offering for investment is not fixed, but varies with the expected return, the above investigation requires some modification. We have indicated, however, the nature of such change as must be made. If, for precision, we assume the market rate to be 3 per cent per annum, we may conclude, from the point of view here taken, that those who can offer a *net* return of 3 per cent or more are all able to obtain the capital they can employ at this rate, while those opportunities for investment which promise any smaller return cannot be developed so long as the lending rate does not fall.

In thus expressing the conditions of the equilibrium rate, we have partially anticipated the other side of the question, the lender's position. The explanation of interest as the reward of abstinence on the part of the lender has been the subject of a great deal of ridicule at various times, and the notion that the lending of large sums by millionaires involves a degree of painful abstinence proportioned exactly to the magnitude of the sum lent is, indeed, calculated to provoke ridicule (see especially Lassalle's *Herr Bastiat Schulze-Delitzsch*). Professor Marshall has preferred to substitute the word *waiting* for the word *abstinence*, and to speak of interest as the reward of

waiting, so as to avoid the association of ideas which suggests inevitably that abstinence involves self-denial, even to a painful degree.

It is certainly true that the amount of capital which can be borrowed depends in general on the (net) rate which can be offered in payment. The owner of goods, or of the means of obtaining goods, which can be used in production may be conceived as having the choice of entering on production himself, of lending to another, or of obtaining and consuming unproductively the value of the wealth which is at his disposal. Whether he will do the one or the other is largely determined by the rate obtainable by lending, or by employing capital himself. The satisfaction afforded by present consumption is balanced against the satisfaction to be obtained by the opportunity of increased command of the means of satisfaction obtainable by postponing consumption. Doubtless very large sums might be lent if the return obtainable were far less than even at present. The supply of loanable capital might be large even if interest were zero, but, on the other hand, as the rate rises, the supply undoubtedly increases. If, again, for the sake of precision, we assume that 3 per cent per annum is the actual rate, most of the capital actually lent would probably be lent if the rate were below 3 per cent, but not the whole. The last additions to the supply, tempted out by the last increment in the rate payable, may not unfairly be supposed to be lent under circumstances where the actual interest obtained, or bargained for, is regarded as the equivalent of the postponement of consumption, and not more than that equivalent.

The actual rate being 3 per cent, those who are willing to lend find investments for all the capital on which they are content to take interest at 3 per cent. or less, while capital which they are unwilling to lend at rates not greater than 3 per cent remains unlent.

The case of interest may, therefore, be said to be comparable with the ordinary cases of equilibrium of demand and supply, the equilibrium rate being such that lenders willing to take that rate or less find investment for their capital at that rate itself, while opportunities for utilising capital in production so as to obtain a return equal to, or greater than that rate, are utilised.

In the case of capital actually invested and not transferable from an unprofitable to a profitable employment, the actual yield affects the valuation of the capital, this valuation being such as would, at the current rate of interest, produce the net yield obtained. Thus the valuation of capital sunk in productive or unproductive enterprises may be vastly greater or much less than its value when the investment actually took place. Such changes in valuation are only capable of producing an indirect effect on current rates of interest, and that mainly by influencing estimates of future returns to new investments.

Changes in the level of interest may be due to causes affecting either the demand for or the supply of loanable capital. Scientific discoveries and useful inventions extend the field for profitable investment, and, by affording more abundant opportunity of realising large returns, tend to raise the rate of interest. Changes in the influences which affect the accumulation of capital or the willingness of lenders to accept a return of given amount, such as changes in the estimate of the future in comparison with the present, tend to increase or decrease the supply of capital offering at every rate possible, that is to say, tend to cause equilibrium to be established at higher or lower rates as the changes are in the direction of limiting or of increasing the supply.

The influence of changes in the value of money, inasmuch as such changes affect the actual return obtained from investments, and cause it to be different from the nominal return, is of importance in modifying the market price of loans. Further, readiness of realisation is of great importance to many investors, and a lower rate of interest is often accepted when it is of importance to be able to recover the value of the capital invested without loss of time and with a minimum of cost. These circumstances find their place in the general theory, modifying some of its details, but without altering the broad outlines which are sketched above.

[The remarks which conclude the article on "Capital" apply equally here. Böhm-Bawerk's references to the writers whom he criticises may be consulted in seeking the views of particular writers, those writers whose theories are, in their main outlines, similar, being treated together so far as possible, and footnotes indicating the parts of their writings where their theories may be sought. In particular, reference may be made to Roscher's *Political Economy*, bk. iii. ch. iv., to Marshall's *Principles*, bk. vi. ch. vi. (2nd ed.), to Common's *Distribution of Wealth*, and to bk. ii. ch. vi. of Sidgwick's *Principles of Political Economy*. See also Cliffe Leslie's essay on the *History and Future of Interest and Profit*, and the interesting discussion in Wieser's *Natural Value*, bk. iv. and ch. xi. bk. v.

Besides the treatment of interest in systematic treatises, a considerable amount of valuable discussion of many points in the theory has taken place in various periodical publications. A sketch of Böhm-Bawerk's theory was given in the *Quarterly Journal of Economics*, April 1889, and the issue of the English translation of his treatises provoked a lively discussion in that Journal, in which Professor Walker joined in July 1892, in a sense unfavourable to the Austrian writer. This continued till the end of 1893, and has been revived by the appearance of the first

instalment of Böhm-Bawerk's reply to his critics in January 1895. Among articles in German periodicals, an appreciative notice of Böhm-Bawerk's work by Knut Wicksell in *Jahrbücher für Nationalökonomie und Statistik*, may be mentioned. The *Political Science Quarterly* and the *Annals of the American Academy of Political and Social Science* have also contained occasional articles on the subject which was being debated in the Harvard *Journal*. In a contribution to the *Annals* in November 1893, Professor Arthur T. Hadley seeks a justification of interest on the ground that it affords the best available method of effecting a proper selection of employers. Among discussions of the objections to interest on moral grounds, Prof. H. S. Foxwell's article on "The Social Aspect of Banking" in the *Journal of the Institute of Bankers*, February 1886, may be referred to. Prof. Smart's article, "The New Theory of Interest" in the *Economic Journal*, December 1891, gives a brief account of Böhm-Bawerk's theory, convenient for those who do not desire to read his works themselves.] A. W. F.

INTEREST AND USURY. "Interest," as distinguished from "usury," the older name, now always employed in an objectionable sense, is usually taken as meaning a moderate, in opposition to an excessive, return exacted by a creditor for the loan of capital. This connotation has a certain historical justification. The word "interest" (*interesse*) really refers to the compensation which under the Roman law was due from the debtor who had made default. The measure of compensation was *id quod interest*, the difference between the creditor's position in consequence of the debtor's laches and the position which might reasonably have been anticipated as the direct consequence of the debtor's fulfilment of his obligation. From this idea of compensation has come that of profit on the loan of money, for which the Latin technical term was *fœnus* or *usura*. The evil significance of this last term arose from the fact that, despite the laws limiting interest, the most exorbitant rates were charged by aristocratic Roman money-lenders to provincials (Cic. *ad Att.* v. 21, § 11). In primitive societies the return of a payment, whether in money or kind, for the loan of capital, using this word in its widest sense (cp. Levit. xxv. 36, Deut. xxiii. 19), appears to have been sometimes an unknown, always a repugnant practice. This repugnance is to be accounted for by the fact that in early stages of civilisation loans are employed, not as capital, for profitable production, but for consumption, and are consequently needed, as a rule, by persons in want. To exact not only a return for the commodity consumed or for the money spent, but something more besides, appears to be to take advantage of a neighbour's necessities. Tacitus observes of the Germans that both interest and usury were unknown among them: "Fœnus agitare et in usuras extendere ignotum" (*Germ.* 26). Where the practice of lending on interest prevailed in early societies we naturally find high rates, and as a consequence the existence of a class of debtors who in default of payment, whether of principal or interest, have been adjudged slaves to work off the debt. Caesar (*B. G.* iv.) tells us that Orgetorix had a great number of debtors in his service, and after the Germans had been brought into contact with Roman civilisation, they followed the Roman law of reducing debtors to slavery when insolvent. This was probably the mischief against which the Mosaic law guarded by its prohibition to the Jews to lend upon usury except to strangers (Deut. xxiii. 20), a prohibition authoritatively interpreted by a Sanhedrim of seventy Jewish doctors in 1807 to include interest in any sense. That the Mosaic injunction was not observed appears from Nehem. v. 7 foll., which recounts a restitution to Jewish debtors of the lands on which money had been advanced by Jews at the rate of 1 per cent per month (Salvador, *Histoire des Institutions de Moise*, iii. c. 6).

The practice of enslaving the insolvent debtor, common alike to ancient Egypt (Diod. i. 79), Greece, and Rome, was abolished at Athens by the *Seisachtheia* of Solon (B.C. 594) which, according to some ancient writers, included a reduction of the rate of interest, stated by Plutarch to have been about 16 per cent (Plut. *Solon*, 13). In the opinion of Mommsen no restriction was put by it upon interest. At Corcyra, in the 2nd and 3rd centuries B.C., loans on good security commanded 24 per cent, while the common rate at Athens in the time of the orators was 12 to 18 per cent. These high rates, so far as they are not to be attributed to the risk run by the creditor, are partly due to the dearth of capital, partly, as Roscher has pointed out (*Ansichten der Volkswirthschaft*, i. 18), to the cheapness of labour, the rate of interest being determined by the returns to capital which in slave states absorbs all that is produced except the barest minimum of subsistence. But such high rates are exceedingly oppressive to agriculturists, whose fortunes are always precarious. It was principally for the benefit of this class that the *Seisachtheia* of Solon was passed, and it was from the same class that the characteristic words for interest both in Greek and Latin (*τόκος*, *fœnus*) were borrowed. Interest was "produce." Upon this turned the logomachic argument of Aristotle against interest, that coin could not breed, and that, therefore, money derived from the loan of money was unnatural (*Polit.* I. x. 4, 5). This point of view, though it arose out of a coincidence of terminology, for centuries dominated European thought. Aristotle, in fact, was seeking justification for the general sentiment against those who lent money on interest. But that he tolerated

interest appears from a passage in the *Ethics* (IV. i. 40) in which he ranks among those who ply illiberal trades "lenders of small sums at high interest," *i.e.* in the common acceptance of the word, usurers. So with Plato, who is generally represented as altogether condemning interest. It is true that he forbids the payment of interest in his ideal state, but in the same passage (*Laws*, v. 742) he also forbids repayment of capital, and these prohibitions must be interpreted not as of general import, but in conjunction with his desire to exclude private possession of wealth. In another passage of the same work (xi. 921 c) he expressly enjoins the payment of an obole per drachma monthly by way of interest, *i.e.* 200 per cent per annum, in case of wilful neglect to pay, after the lapse of a twelvemonth, for goods received. It must be remembered that the Greek sentiment against money-lenders was not confined to that class, the literature from Homer to Aristotle treating with scarcely less disdain the callings of the merchant and the manufacturer.

The ancient law of Rome allowed interest; which, as usual in agricultural communities, reached an exorbitant height. As at Athens, so in the early history of Rome, popular suffering necessitated a readjustment of debts. The law of the Twelve Tables (B.C. 451-450) first, according to Tacitus (*Ann.* VI. xvi. 3), limited the rate to $\frac{1}{12}$th part of the capital, *uncia*, *unciarium fœnus*.[1] The hatred in which money-lenders were held is visible in the provision mentioned by Cato (*De Re Rustica* procem.), that they were condemned for transgression of the law to twice as high a penalty as the thief. In B.C. 347 interest was fixed at 5 per cent: in B.C. 342 it was abolished altogether by the Lex Genucia. But the nobility controlled the civil procedure through the prætorship, and as the law did not bind any but Roman citizens, the evasion was practised of issuing loans in the names of Latins and allies (Livy, xxxv. 7). By the Lex Sempronia (B.C. 194) this mode of evasion was suppressed. Although the prohibition of interest long remained law, it was found impracticable. The consequence probably was, according to the opinion of Montesquieu and Adam Smith, a rise in the rate of interest to compensate the creditor for increased risk, and accordingly, during the economic crisis of B.C. 89, which followed the Social War and the Asiatic troubles, prosecutions of creditors by dishonest debtors took place. These were eventually put an end to in the following year by the Lex Unciaria of the consuls Sulla and Rufus, which fixed the rate of interest at 12 per cent per ann. This rate was known as *centesima usura*, *i.e.* $\frac{1}{100}$th part of the capital per month. By a decree of the senate in B.C. 50 this became the legal limit throughout the Roman provinces.

The dislike felt by the Romans to the exaction of interest showed itself in the remedies granted by the law against the debtor. While in the case of a sum of money lent (*pecunia certa credita*) the creditor could enslave the person of his debtor for the unpaid principal, he had only a civil remedy against his property for the interest. Creditors accordingly hit upon the device of bringing claims for interest under the form of actions for money lent, and thereby enforcing the judicial enslavement of the debtor (*addictio*). This legal artifice was put an end to by the Lex Pœtelia in B.C. 325, which further allowed a debtor in temporary difficulties to surrender his property. But as regarded the really insolvent, the old law remained in its severity, so far as the principal of the debt was concerned. It is to the credit of Julius Cæsar that by the *Lex Julia de bonis cedendis*, he revolutionised the law of Rome and laid the foundation of all modern systems of bankruptcy by allowing the debtor to formally cede his estate and enter upon a "new financial existence, in which he could only be sued on account of claims proceeding from the earlier period and not protected in the liquidation, if he could pay them without renewed financial ruin" (Mommsen, *Hist. Rome* bk. v. ch. xi.). Such remained substantially the state of the law until the time of Justinian (A.D. 533). Justinian fixed new rates of interest. Whereas in the case of *fœnus nauticum* or bottomry, there had been no limit, he reduced it to a maximum of 12 per cent per annum. Compound interest was not allowed, nor could any claim for arrears of interest be made for a larger amount than the amount of the principal debt. The new rates were adjusted to a classification of ranks, presumably constructed upon the basis of a hypothetical ability to pay interest. While the maximum payable by merchants and business men was 8 per cent, that for persons not in business was 6 per cent, while distinguished personages, *illustres*, and agriculturists, ranked together as capable of paying 4 per cent. This classification probably suggested the later doctrine of the canonists, that all questions involving profits or interest must be considered relatively to the class of society concerned. All mediæval legislation regarded the suitable maintenance of rank as essential to the welfare of society (see SUMPTUARY LAWS). The Roman law also laid the foundation of two other doctrines which became corner-stones of the canonists' teaching. It has been seen that even Plato allowed a penal interest of 200 per cent in cases where a debtor had wilfully neglected, after a year's delay, to discharge his obligation. Such delay was technically known in Roman law as *mora*, and even in cases where interest was not otherwise payable,

[1] *Fœnus unciarium* $\frac{1}{12}$th or $8\frac{1}{3}$ per cent for the *lunar* year, therefore 10 per cent for the *solar—usuræ centesimæ*, 1 per cent per month, 12 per cent per annum. Ramsay, *Roman Antiquities*, p. 420.

as in *fideicommissa*, it became due upon proof of mora, subject to the discretion of the judge (*Dig.* lib. 19, tit. 1, 49, 1). The fact that the rate of interest due for mora was determinable by the rate locally current, suggests that the ground of the adjudication was that the creditor had been prevented dealing profitably with his money in the interval, which is the doctrine of LUCRUM CESSANS, as expounded by the canonists. Further, by the Roman law mora with its penalties was incurred by the debtor for any consequential loss to the creditor. This became the canonical doctrine of DAMNUM EMERGENS (*q.v.*).

The early ecclesiastical history of interest has already been given (CANON LAW). In England it was forbidden by two northern synods in 787. Before the Conquest, canonical and secular provisions were placed side by side in the compilations of the Anglo-Saxon kings. William the Conqueror, by his separation of the work of the bishops' courts from the work of the sheriffs' courts, paved the way for the study and application of canonical principles, which took place in the 12th century. The real founder of the study of mediæval canon law in England was Theobald, Archbishop of Canterbury (1139-61). Its codification began in the reign of Henry III. To this age belong the constitutions of Richard Poore, Bishop of Salisbury, 1217-28, which forbid the taking of the produce of a pledge after the principal sum has been received from it *deductis expensis*. A contemporary canonist, one of the very few English authors on the subject, was Thomas Chabham (or Chobham, fl. 1230), who wrote eight books, *De Casibus et Pœnitentiis*. He was also the author of *Casus aliquot de pignoribus et in quibus latet Usura*. Both these treatises are in MS. in the British Museum. He defines usury as *incrementum fenoris abusu eris crediti*, a definition which embraces interest. But it is remarkable that when William Lyndewode collected the constitutions of the Church of England in the reign of Henry V., a collection which formed the canon law of the realm, scarcely any mention of usury occurs. Possibly this was a concession to the claims of the lay lawyers to take cognisance of the practice of exacting interest as an offence against the common law (see ENGLISH EARLY ECONOMIC HISTORY). In 1364 Edward III. empowered the city of London to issue an *ordinatio contra usurarios*. But parliament complained of the practice of usury in 1390, and a more explicit *declaratio usuræ* was issued by the mayor of London. This defined the offence of usury to consist in the lending "gold or silver to receive gain thereby, or a promise for certain without risk" (CANON LAW). There is much to show that these condemnations of usury were prompted by hostility to the Italian financiers who practised the taking of interest in transactions effected by bills of exchange. Repeated complaints of this were made by the Commons, the belief being general that by means of bills of exchange the kingdom was depleted of the precious metals. This is expressed in the *Libelle of Englyshe Polycye* (1436). With the cessation of the Wars of the Roses a marked development of credit set in, and though the charging of interest on bills of exchange was still subject to ecclesiastical and popular reprobation, we learn from Pauli's *Three Memorials* that a class of native exchangers had sprung up in England. Upon the accession of Henry VII. a reaction took place. The control of policy was in the hands of John Morton, Archbishop of Canterbury, chancellor, and afterwards cardinal. Morton was a canonist, who had been a leading counsel in the ecclesiastical courts, and on the opening of parliament in 1487 delivered a speech condemning the practice of usury and unlawful exchange, that is, exchange in which interest was reckoned. (See DRY EXCHANGE; and MORTON'S FORK). In the same session an act, which bears marks of ecclesiastical influence, was passed against both. The act condemned under the term "new chevesaunce" the loan of money at fixed interest to begin from a certain date. The "Acte agaynst exchaunges and rechaunges" specially struck at accommodation bills. The "Acte agaynst usury and unlawfull bargaynes" (3 Hen. VII. c. 5) gives examples of the way in which the ecclesiastical laws against usury were evaded. Sometimes the form of a sale was gone through, the object sold being an obligation, and the advance for a less sum than the obligation acknowledged being taken in exchange, a system which continued down to the time of Jeremy Bentham, and is described by him. Sometimes a pledge, as a horse, was delivered up, of which the creditor enjoyed the use without setting it off, as he was bound by canonical law to do, *pro tanto* against the principal. Sometimes the device of sale and resale was resorted to. This was the fictitious sale of goods to the borrower on credit, and their repurchase at a less sum of ready money paid by the lender. The sum booked against the borrower included both capital and interest, while the goods remained in the lender's hands. Sometimes a bill of DRY EXCHANGE (*q.v.*) was drawn. Sometimes a gratuity was promised by way of interest. All these evasions were in use on the continent, and had been condemned at numerous synods both there and in England. The offence under the act of 1487, of demanding a fixed percentage, was based on the old canonical doctrine that no claim for interest arose except in the case of DAMNUM EMERGENS, and perhaps also in that of LUCRUM CESSANS, and that these could not be estimated beforehand (CANON LAW). In this respect England, by the act of 1487, fell behind the contemporary doctrine and practice of the continent. The

act proved a failure, in the opinion of the framers of its successor, owing to the unskilfulness of the drafting. In 1495 Morton again addressed parliament upon the evil, and introduced a fresh "acte agaynst Usurye" (11 Hen. VII. c. 8). This repealed the act of 1487. Under the new act the stipulation for interest at the time of the making of a loan was the offence. But a clause "savyng laufull penalties for nounpayment of money lent," by allowing the fixing of *pœna conventionalis*, or *usura punitoria* (CANON LAW), opened a wide loophole for evasion. Sale and resale were defined as illegal when the borrower was at the time *in necessite*. Mortgages in which the creditor should not account for mesne profits were condemned, there being no "aventure" attached to the loan to justify the creditor in receiving them as interest. From this time the law remained unchanged for fifty years. Nevertheless the practice of taking forbidden interest continued, as may be gathered from contemporary popular writers. To some extent it was condoned by being included specifically or implicitly in the general pardons issued from time to time by Henry VIII. The customary rate of interest at this period was 10 per cent upon good security. After the assumption by Henry VIII. of ecclesiastical supremacy in 1544, "all offences of usurie and corrupt bargaynes" were excepted (35 Hen. VIII. c. 18) from the general pardon; but in the following year, for the first time in the history of England, the demand of a fixed rate of interest was made legal by 37 Hen. VIII. c. 9, which repealed the act of 1495. The maximum was to be 10 per cent per annum. By a clause intended to cover some of the canonical justifications of a contract for the payment of interest, opportunities were afforded for the evasion of this maximum. The importance of the act is that it was a clear breach with the canon law, which recognised no quantitative distinction between usury and interest. It is upon the distinction created by this act that our modern conception of the two rests. The act caused lively remonstrances on religious grounds. The reforming party, as a rule, followed LUTHER (*q.v.*) in his earlier view of the sinfulness of interest. In 1552 Northumberland, who posed as an extremist in religious matters, passed a bill through the Lords "against usurie," which became law (5 & 6 Ed. VI. c. 20). This was a drastic prohibition of interest in any shape or form, a clean sweep being made of all the canonical exceptions justifying interest. Probably the customs of London based on the canon law were maintained, as having received regal confirmation. Attempts were made in the following year, without success, to mitigate the severity of the new act. It is doubtful whether the government of Mary permitted the enforcement of a law repugnant to the ecclesiastics as a defiance of the canon law, especially as the chancellorship was in the hands of Gardiner, bishop of Winchester, and afterwards of Heath, archbishop of York. In 1558 Mary herself offered the city of London dispensation from the penalties of taking usury if they would advance her a sum of money at 12 per cent interest. But the act of 1552 remained unrepealed until 1571, when Elizabeth re-established the rate of 10 per cent (13 Eliz. c. 8).

With the Reformation the canonist doctrine naturally came up for review. The general trend of the opinion of reformers, and this was shared by Luther in his later years, was that interest was tolerable as a concession to human frailty. This argument was adopted by Bacon. But CALVIN and Dumoulin, better known as MOLINÆUS, a French jurist, were not satisfied with a negative protest against the intolerant prohibitions of ecclesiastical dogma. They reopened the whole question *ab initio*. In a letter to Œkolampadius, Calvin boldly questions the Aristotelian logomachy on which the patristic and scholastic position was so largely based. Money, he argued, was not fruitful; but neither was a house, which, it was admitted, could lawfully be let for profit. He pointed out that the concessions made by the canonists in fact involved a license to take interest, and that the persistence in a verbal prohibition was "puerorum instar ludere cum Deo." But he adopted, as matter of Christian discipline, the rule that interest should not be demanded of men in urgent need, and as matter of state discipline, that the legal rate should not be exceeded. Molinæus (*Tractatus Contractuum et Usurarum*, 1546) founded his justification on the Roman law that there is inherently involved in a loan an *interesse*, whether in the shape of "lucrum cessans" or of "damnum emergens." This justification of interest, which brought upon Molinæus the censures of the church, naturally found favour in the great mercantile and Protestant community of Holland. Grotius, while assenting to Molinæus's criticism of ARISTOTLE, nevertheless hesitated to explain away the language of Scripture which had been for so many ages accepted as prohibitory (*De Jure Pacis ac Belli*, II. xii.). This step was taken by SALMASIUS in 1638 when professor at Leyden, who in fact popularised the arguments advanced by Molinæus.

In England the prohibition of 1552 having proved a failure, Elizabeth in 1571 re-established the rate of 10 per cent. In 1624 the rate was reduced to 8 per cent. The principle being practically conceded, discussion ranged about the question of a legal rate. The wealth of Holland towards the end of the 17th century being accompanied by a low rate of interest, led to the conclusion formulated by Sir Josiah Child in his new *Discourse of Trade*, first published in 1668, that the relation of the two was that of

effect and cause, and that prosperity might be secured for this country by a reduction of the legal rate of interest to 4 per cent (Child). But this opinion was combated by other contemporary writers. Of these the best known is Sir William Petty, who in 1682 published a treatise under the title *Quantulumcunque*, condemning altogether laws regulating the rate of interest. LOCKE is generally taken to have written in the same sense; but though the arguments in his tract, *Considerations of the lowering of Interest and raising the Value of Money*, tend in this direction, he expressly adduces two reasons why there should be a law to regulate interest. His first is that there may be a rule of practice for courts of law in assessing debts and damages. Such a rule of practice prevails at the present day. His second reason is that thoughtless borrowers, "young men and those in want, might not too easily be exposed to extortion and oppression," a line of thought afterwards adopted by Adam Smith.

In the meanwhile the new doctrines made but slow headway in Roman Catholic countries. It is true that successive refinements of the canonists in deference to the advancing exigencies of commercial life had left nothing but the husk of the prohibition remaining. But a defence of interest upon its own footing, following the lines of Calvin and Salmasius, was too venturesome an assault on the position so long maintained by the church. Even as late as the reign of Louis XIV., interest on commercial debts was forbidden, with an exception in favour of the flourishing industrial city of Lyons; nor did interest become legal until the revolution. In England, opinion had so far passed over to the opposite camp that Adam Smith, writing in 1776, assumed interest as necessary to production in providing the capitalist with an incentive to productive expenditure. About the same time in France, Pothier, a French jurist, and the celebrated TURGOT resumed the ancient controversy as to the justification of interest.

The occasion which produced Turgot's essay on *Les Prêts d'Argent* was a commercial crisis in Angoulême in 1769. A feature of this crisis was an excessive number of accommodation bills upon advances to borrowers for purposes of unproductive consumption. Notwithstanding that the legal rate of interest in France was at this time 4 per cent, there were, as Adam Smith tells us, "several very safe and easy methods of evading the law." The bankrupt borrowers, unable to obtain further advances, followed the example set by Richard II. of England, and combined to prosecute their creditors under the usury laws. Turgot, at that time intendant of Limoges, procured the removal of the cases from the local courts to the council of state, and drew up for its guidance a memorandum, "Sur les Prêts d'Argent," in defence of interest. In this treatise, which was not published till some years later, he first establishes the necessity of interest for commercial and industrial purposes; he then refutes the arguments of the schoolmen; he inquires into the historical causes which have rendered money-lenders odious; and concludes by demanding that the taking of interest should be legalised and the rate left to be settled between borrower and lender. Like Adam Smith, he adopted the standpoint of individualism, that a man has a right to do what he will with his own, and that, on the whole, this liberty is most conducive to the general well-being. Turgot also addressed himself to the arguments advanced by Pothier and his school upon legal grounds. Their contention was that in a contract which is not gratuitous, equity demands an equality in the values exchanged. One party should not give more than he has received, nor the other receive more than he has given. This maxim of equity is violated when the lender receives back more than the capital. The argument was, as Pothier admitted, a reproduction of that of the *res fungibiles* of Aquinas (see AQUINAS; FUNGIBLES). Turgot's reply is first, that equality of values depends on the opinion of the two contracting parties as to the degree to which the objects exchanged will satisfy their demand; secondly, in this following Molinæus, he challenges the fundamental position upon which the prohibition of interest had been based, viz. that a loan is a transfer of property, and that an owner of property (the transferee) cannot be called upon to pay for the use of that which is his own. "Misérable équivoque encore," replies Turgot, "il est vrai que l'emprunteur devient propriétaire de l'argent considéré physiquement comme une certaine quantité de métal. Mais est-il vraiment propriétaire de la valeur de cet argent? Non, sans doute, puisque cette valeur ne lui est confiée que pour un tems et pour la rendre à l'échéance" (*Mémoire*, § 27). Turgot's memoir saved the money-lenders of Angoulême, and so far effected a change of public opinion in France that at the Revolution the national assembly declared all loans on interest legal. The work of Turgot in France was finally done for England by Jeremy BENTHAM (*q.v.*) in his celebrated "Letters in defence of Usury." In these he finally disposed of those pleas for legal maximum rates based on the assumed necessity of protecting the simple and discouraging the prodigal, which had been accepted by Locke and Adam Smith. In England the whole of the acts against usury, dating from that of 1545, were repealed in 1854. For the list of them see the schedule to 17 & 18 Vict. c. 90. In Denmark they were repealed in 1855; in Spain in 1856; in Sardinia, Holland, Norway, and Geneva in 1857; in Saxony and Sweden in

1864; in Belgium in 1865; and in Prussia and the North German Confederation in 1867.

A new act against usury was, however, introduced for the whole of Germany in 1880, and amended and extended in 1893. It is now a criminal offence to obtain a profit by taking advantage of the necessitous condition or inexperience of any person in reference to loans or other transactions, "exceeding the usual rate of interest in such a way that the profit seems out of proportion to the service rendered," and all transactions of this nature are null and void; it is also a criminal offence to "trade as a usurer."

Professor Foxwell, while avoiding any justification of the claim to interest upon abstract, moral, or metaphysical grounds, and anticipating the possibility of the arrival of a time when the tendency of interest to a minimum may result in a natural compulsion upon the capitalist to pay a "negative interest" to the banker who undertakes the care and management of his capital, justifies interest upon the practical ground that it is necessary in the existing state of society as an inducement to the capitalist to save. It is interest which "brings about economic equilibrium" between the demand for capital, of which the function is to give labour more effective power and continuity, and its accumulation.

The tendency of profits, including in this term the bare interest upon capital, to a minimum, has been discussed at length by J. S. Mill. Mill assumes that there is "some particular rate of profit which is the lowest that will induce the people of that country and time to accumulate savings and to employ those savings productively." This rate is determined by (1) "the strength of the effective desire of accumulation"; (2) "the degree of security of capital engaged in industrial occupations." These two determinants interact and grow in force with the progress of civilisation. In a country where population is increasing, capital becomes increasingly applied to agricultural industry, which progressively yields less (see DIMINISHING RETURNS), a law which conditions the whole rate of profit. Where population is not increasing, the competition for labour causes a rise of wages, with the same result. The counteragents to the tendency are therefore the loss of capital in commercial crises and unsound investments; inventions, cheapening articles of common consumption, and thereby reducing the cost of labour; and importation of food from abroad.

It is to be observed that Professor Foxwell's view that there is no absolute minimum is more probable than that of Mill, who underestimated the force of the tradition of accumulation. Hence, Böhm-Bawerk throws modern theories into three classes. The first of these, to which he gives the name the "naïve productivity" theory, attributes the production of interest to capital, which in the distribution of the product only claims that of which it was originally the source. The second, which he calls the "socialist exploitation theory," regards interest as the appropriation of that which is due to labour, out of which it sprang, labour being the sole source and measure of value. The third view is intermediate. While accepting the first view of capital as being in conjunction with nature and labour a source of production, it dwells upon the importance of exchange values in determining the amount which can be appropriated by the capitalist. While the first two theories confine their attention to interest as a problem of production, "the interest problem in its last resort is a problem of value" (Böhm-Bawerk, *Capital and Interest*, trans. by Smart, Macmillan, 1890; *Conclusion*, p. 423).

While Adam Smith accepted interest as an economic fact without endeavouring to justify it on analytical grounds, he indirectly furnished a basis for a revisal of the whole question of its justification. In discussing the sources of wealth, Adam Smith, while he frequently mentions land and capital, leant to the doctrine that wealth was exclusively derived from labour. This position was borrowed from Locke, who lays down that labour "put the difference of value on everything" (*Civil Government*, bk. ii. ch. v. § 40). Ricardo, like Adam Smith, without elevating the proposition into a system, adopts the general idea. As to this, see Professor Marshall's note on Ricardo's theory of production in relation to value (*Principles of Economics*, bk. vi. ch. vi.). From this it was an easy transition to the view of the modern socialists, that interest is abstracted—wrongfully abstracted—from labour. The connecting link between the two views is the French economist SISMONDI in his *Nouveaux Principes d'Économie Politique*, first published in 1819. Sismondi escapes the logical conclusion of the theory by ascribing the right to interest to the original labour which forms capital. The scientific socialists, however, claiming to rest their teaching upon Adam Smith and Ricardo, regard the returns to capital, whether called by the name of profit or interest, as a fraud upon the labourer to which hunger compels him to submit.

Of this school PROUDHON was the earliest distinguished representative in France; in Germany, RODBERTUS-JAGETZOW and Karl MARX. According to Rodbertus, interest—profit and rent alike—rests on two grounds, one economic, the other legal. The economic ground lies in the fact that since the introduction of division of labour the labourers produce more than they require to support themselves in life, and so allow them to continue their labour, and thus others are also able to live upon the product. The legal ground is the existence of private property in land and capital, and Marx reproduces the same idea. In the view of the anti-socialist economists, these conclusions are only arrived at by divorcing propositions of Adam SMITH and RICARDO from their context and ignor-

ing the fact that capital is in itself productive and belongs to the capitalist as the reward of abstinence from its expenditure. The economists who earliest insisted on the first of these characteristics of capital were J. B. SAY and Lord LAUDERDALE, while N. W. SENIOR, formerly professor of political economy at Oxford, is the founder of the abstinence theory (CAPITAL). Eclectic economists, such as Roscher, include both these elements.

The American economist, Mr. F. A. Walker, turns the point of the old Aristotelian and canonical objections to interest by insisting that in actual fact, exemplified by cases in which no coin passes, as well as in theory, interest is paid for the use of the objects for the acquisition of which credit is given or money lent. He leans to the modern view that in the states of society in which prohibitions of interest originate, there may have been justification for them, and they probably exercised some effect. These conclusions he applies to similar conditions in modern communities, as for instance, in extensive regions of the United States, where agriculture is prosperous, where industry has made some progress, yet where the community still remains mainly non-commercial. But he agrees that in highly commercial countries "usury" laws become purely mischievous.

Recent English economists, such as Mr. Sidgwick, show the natural English tendency, exemplified in Adam Smith and Ricardo, to abandon discussion of the metaphysical justification of interest, and accepting it as an ultimate fact, to confine themselves to analysing the economic laws by which its rate is determined.

The general conclusions of economists as to the determinants of the rate of interest may be summarised as follows. In civilised communities a general level of "net" interest tends to establish itself, the differences between rates being for the most part due to differences in the risk of the investment. That on the whole, in such communities, small command less interest than large amounts of capital owing to the difficulties of collection and the irregularity of withdrawal. Of this savings banks are an example. The mere increase of capital does not lower the rate of interest (Hume, *Essay on Interest*; Ricardo, *Principles*, ch. xxi.), which is determined, on the analogy of Ricardo's theory of rent, by the competition of borrowers and its least productive employment. Hence, as a community increases in civilisation, and capital has to be employed on less fertile lands and less productive investments, the return to capital tends to decline; in other words, interest falls. Influences which counteract this tendency are the acquisition by a nation of fresh land or a cheapening of the means of subsistence by the abolition of protective duties; the conversion of circulating into fixed capital (see CAPITAL); the destruction of capital by war, and the emigration of capital.

Within the limits of the Roman Catholic communion the principle has constantly been upheld that to accept usury is sinful. This was laid down by Bossuet in his *Traité de l'usure*, and repeated by Benedict XIV. in the encyclical on usury of 1745 intituled *Vix pervenit*. But when the era of the reformation opened up the whole question, the energy of the canonists was devoted not to fortifying the old positions, but to emptying the principle of its application. Concessions were at first made in those directions in which the severity of the prohibition had from early times been mitigated. Rent-charges upon land, and their purchase and sale, had been canonically legal since 1425, subject to the charge being really attached to land or fixed property yielding actual returns. But in 1452 a bull of Nicholas V. had permitted the inhabitants of the kingdoms of Aragon and Sicily to enter into contracts for the payment of interest on loans based on personal credit (*census personalis*). Against the principle of this concession a reaction took place under Pius V., who, by a bull *Cum onus* in 1568, reverted to the old limitations. But the concession of Nicholas V. had already done its work. The Jesuit casuists, solicitous to adapt the church to contemporary exigencies, discovered a number of reasons for disregarding the new bull. It required, they affirmed, to be invested with authority by promulgation and acceptance in the several countries of Europe. Others, as Liguori, maintained that it only prohibited such loans where fraud was present. Though Benedict XIV. lent his sanction to the condemnation of the *census personalis*, the system continued to flourish even in Rome itself. Another concession which opened the door to the ruin of the whole system was that known by the name of the *contractus trinus* (see ECK, Johann). This, as its name imports, was a combination of three contracts. The first of these, which laid the foundation for the others, was the contract of partnership in risk of profit or loss (*societas*) which had always been allowed. The two subsidiary contracts were contracts of assurance. By the surrender of a part of his expected profit the capitalist could insure himself against loss of capital; by the surrender of a further part he could insure a fixed return (*venditio lucri incerti pro lucro certo*). Now regarded together, and as between the same parties, these three contracts represented an advance of money at a fixed rate of interest. As such they were before the 16th century canonically illegal, though each taken by itself, where the parties were different, was legal even though in respect of the same transaction. Convenience suggested that all these contracts should be made between the same parties, and commerce naturally adopted this plan. As usual in the history of interest, it remained for the theologians to find a justification for the *fait accompli*. This was accomplished by Eck and Major early in the 16th century. But, as in the case of the *census personalis*, so in this, the Catholic reaction at first, by the bull *Detestabiles* of Sixtus V. in 1583, condemned the *contractus trinus* as usurious and illegal. The new school of

casuists, on the other hand, took up the position that the condemnation only applied to cases where usurious practice was potent. Finally, as in the *census personalis*, commercial convenience smothered the protests of doctrine.

In short, by the 17th century the condemnation of usury had been gradually extruded till it had no application outside loans pure and simple. And even in this sphere the concession which had then firmly established itself of allowing the LUCRUM CESSANS and DAMNUM EMERGENS to be calculated beforehand at a fixed rate per cent, left little more than a mere husk of doctrine. The question came up for review before the Roman curia in 1740. The city of Verona raised a loan at 4 per cent, and justified its proceeding by a discourse published by an eminent lawyer, Scipio MAFFEI. The pope, Benedict XIV., issued a special commission to cardinals, prelates, and theologians, to restate the doctrine of usury according to the most recent view. Of this commission the outcome was the encyclical *Vix pervenit* issued in 1745. The old doctrine was reaffirmed, and returns of interest upon loans condemned, except in cases where the claim to interest rested upon some other title than merely that of money lent, or could be justified by the conformity of the contract to one of those forms recognised by the church as legitimate. But the discussion by theologians was not silenced. At last in 1822 an event happened which again compelled the Roman curia to deal with the subject practically. A female penitent at Lyons was refused absolution for receiving legal interest from invested property. She appealed to Rome, and the holy office decided against the confessor, provided the penitent expressed willingness to submit to the judgment of the church. But no formal decision on such cases followed, and in 1838 a general notice was issued to confessors no longer to importune penitents on account of being in receipt of interest. For all practical purposes the doctrine, while it remains intact, has ceased to exist.

INTERLOPERS were persons who, not being members of the companies chartered by the crown, nor having a license from them, traded on their own account to the countries to which the companies had the sole trade. Throughout their existence, the companies suffered much from the competition of these outsiders. The relations between them therefore have an important bearing on economic development, particularly on the growth of free trade. It would be impossible here to give a full account of those relations during the latter half of the 16th and 17th century. But a few instances from the history of the trading companies, and a summary of the arguments for and against the claims of the outsiders, will show the nature of the questions at issue. In 1604, the "free traders" nearly succeeded in breaking up the monopoly of the companies, especially the Merchant Adventurers and the Russia Company. Two bills directed mainly against these associations—(1) "for all merchants to have free liberty of trade into all countries"; (2) "for enlargement of trade for his majesty's subjects into foreign countries," passed the Commons "with great consent and applause of the House (as being for the exceeding benefit of all the land), scarce forty voices dissenting," but they were rejected by the Lords. Complaints of the monopoly of the Merchant Adventurers were again made to the House of Commons by the merchants and clothiers of Exeter and other parts of the west of England in 1638, 1643, and 1645. The ordinance of 1643, regulating the company, appears to have been a concession to the outsiders, and under the Commonwealth and Protectorate there appears to have been a movement of opinion in their favour. A committee for trade, appointed by the common council of London, reported to the council for trade in 1651, that they found the Staplers "unnecessary and disadvantageous," and the discussions in the council in 1656 show strong opposition to the claims of the Merchant Adventurers. Interlopers were a source of difficulty to the Russia Company throughout its career, and important concessions were made to them in 1654. Similar difficulties were experienced by the Levant or TURKEY Company (*q.v.*), the EASTLAND Company, and the EAST INDIA Company. The history of the last-mentioned company supplies several important cases. In 1604, James I. granted to Sir Edward Michelborne and his associates a license "to discover the countries of Cathaia, China, Japan, Corea, and Cambaia, and the

islands and countries thereto adjoining, and to trade with the people there, notwithstanding any grant or charter to the contrary." Michelborne greatly injured the East India Company, but in 1607 they decided to drop their suit against him in the Admiralty. In 1637, Charles I. granted a license to Sir William Courten and others, to trade to Goa, Malabar, and China; his association, or the Assada Merchants, as they were called, competed with the East India Company for many years. In 1650-51, on the recommendation of the council of state, a union was effected between the company, the Assada Merchants, and a third body, the Merchant Adventurers, trading to the Indies, which became the basis of a united joint stock. But three years later, the last two petitioned the council of state for an open trade. The interlopers achieved a temporary success, and for three years the company, the Assada Merchants, and the Merchant Adventurers, as well as numerous private traders, competed with each other, with the result that the East India trade was completely disorganised, and Cromwell was forced to renew the charter of the company. The leading case on the claims of the companies against the interlopers is *The East India Company* v. *Sandys* (1684). It was argued at great length before Lord Chief Justice Jefferies, Holloway and Walcot, by Holt (afterwards lord chief justice), Finch (afterwards Earl of Nottingham), and Sawyer, for the plaintiff; and Treby (afterwards lord chief justice), Pollexfen (afterwards lord chief justice), and Williams for the defendant. Judgment was given for the plaintiff, and Sandys' ship and goods were confiscated.

It will now be convenient to summarise the arguments for and against the interlopers. There were two distinct questions at issue: 1. Did the creation of such companies as have been noticed fall within the limits of the royal prerogative? 2. Could they, under cover of their charters, pretend to an exclusive trade? On the first, opinion was by no means unanimous, some people contending that parliament alone could impose the restrictions on trade which the very existence of a company involved. Additional force was given to this argument, when the companies made the royal grant the pretext for excluding all others from the trade. The outsiders answered the second question in the negative. It was contended that the king could create corporations for carrying on a trade, but he could not restrain others from exercising that trade; such restraint was restraint of a common right; it appropriated to one or a few what others might lawfully use before the grant was made. A charter conferring such exclusive privileges was therefore void. The East India Company, which was a joint-stock company, came, it was said, within the provisos of the statute of monopolies, at any rate, after the expiration of their first charter, though the same objection could not perhaps be urged against the regulated companies. Many statutes were quoted in defence of the claim for free trade; on more general grounds it was held that the right to trade was "a right, natural and human," and a charter against natural and civil right was void. On the other hand, a distinction was drawn between inland and foreign trade, and it was maintained that by common law subjects had no absolute right to pursue the latter, which presupposed treaties or leagues of amity concluded by the king of England with foreign powers; that no statute had ever given a general liberty of trade to Englishmen to or with all nations, and that the special statutes dealing with particular nations or particular commodities were not declaratory, but introduced a new law. The distinction between joint stock and regulated companies was held to be of no weight, because it did not touch the question of right, whether a company could or could not have a grant of an exclusive trade. On the ground of expediency, the case for the companies against the interlopers was strong. The men to whom the first charters had been granted were frequently the first discoverers of the trade, and it seemed only fair that they should enjoy a monopoly to reimburse them for their outlay. Their position was analogous to that of the patentee of a new invention, whose claim to a monopoly for a limited period was universally conceded. The companies also were put to great expense for the maintenance of official establishments and factories, for negotiating treaties, for costly presents, and for other objects. It was unfair that interlopers should step in and reap the fruits of their enterprise, without undertaking any of their arduous and expensive duties. They would naturally be able to undersell the companies in the home markets, and the trade would ultimately be destroyed. It was also maintained that experience was in favour of the company organisation, for the trade could not be carried on successfully by any other means. To those arguments the interlopers had an effective reply. Considerations of expediency did not effect the right to an exclusive trade, and it was that which they called in question. To urge expediency in defence of the companies was to set up convenience, or the pretence of convenience, against law; and such an argument might be as effectively used against the companies as in their favour. It might, for example, be urged by the Assada Merchants, as a reason for suppressing the East India Company. There was no objection to the grant of a monopoly for fourteen years to the first discoverers of a trade, but it should then determine. Besides, most of the trades monopolised by the

companies had been carried on by private traders, or associations of private traders, before the grant of exclusive charters. Those who claimed liberty of trade were willing to bear their full proportion of necessary charges, nor did they wish to dissolve any company. On the contrary, a joint stock was, as a rule, necessary for distant trades. They merely claimed that people should be free to form companies or not, as the conditions of the trade should determine, and that no one company should enjoy a monopoly (see COMPANIES). W. A. S. H.

INTERNAL CUSTOMS AND TOLLS. It has sometimes been asserted of taxes that they supply nations with more causes of grief than of well-being. Whether this sweeping assertion is generally true or not, it is certainly confirmed by experience in respect to internal tolls and customs. France, the earliest unified of western continental powers, affords us a striking example of their mischievous operation, which may serve as an illustration of the inconvenience and injury they cause to the trade of a country.

As appears by one of their names, *droit de haut passage*, French customs are, during the feudal ages, difficult to separate from tolls proper. From 1360 they were called *imposition* or *traite foraine*, and as the provinces had preserved their own special constitutions, several of them, such as Picardy, Artois, Anjou, Poitou, Berry, Auvergne, Languedoc, etc., successively adopted them, the duties being collected by a body of officials called *masters of the ports*, but with various tariffs and under different names—*tablier* at La Rochelle, *prévôté* in Nantes, *comptable et convoi* in Bordeaux, *coûtume de Bayonne, trépas de la Loire, traite foraine* in Anjou, etc. The most vexatious of these customs were those of Lyons and Valence (formerly of Vienne), which commanded the passage of the Rhône, and through which *all* goods, whether foreign or home-made, on their way to or from southern France, were compulsorily and unmercifully obliged to pass. The former amounted to 5 per cent, the latter to 3 per cent, and Forbonnais mentions four cases in which it had to be paid twice; not including the tolls levied by private individuals, he reckons that thirteen different duties were exacted between Lyons and Arles, a distance of 150 miles (*Recherches sur les Finances de la France*, i. pp. 358, 359). The same author quotes the bitter complaints made against the customs of Valence by a deputy of Lyons at the states of Dauphiné in 1600: "These customs are a rock and a cause of shipwreck. They are hatched and grow like crocodiles. . . . The terrified merchants fly from this passage as if it were a cut-throat place (*un coupe-gorge*) . . . and if caught, only recover their liberty when the officers have rummaged their bales to the bottom and their purses also" (*Recherches*, i. pp. 40, 41). The eloquence of the worthy member for Lyons was lost, for these customs continued until 1790.

On the Loire, where Forbonnais enumerates 28 tolls, the oppression was quite as vexatious, and Louis XIV., under the direction of Colbert, uses in the preamble of the edict of 1664 language quite as strong as had been heard sixty years before in the states of Dauphiné. "We have ascertained," are the royal words, "that under different names such a diversity of these [duties and tolls] have been set up that we have been filled with astonishment at the institution of so many levies and impositions, sufficient to disgust our subjects from continuing their trade. . . . The merchants cannot possibly have a sufficient knowledge of them, still less their factors and carriers, who are constrained to rely on the good faith of the managing clerks, often doubtful" (P. Clément, Colbert's *Letters and Instructions*, vol. ii. pt. ii. pp. 787-796).

In this edict, Colbert endeavoured to alleviate and unify the chaotic system bequeathed by past ages, but the *Pays d'États*, who in contrast with the *Pays d'Election* enjoyed the privilege of voting and assessing their taxes, steadfastly resisted; the minister was obliged to submit, and France had to be divided into three regions.

1st. Twelve provinces, mostly round Paris and between the Somme and the Loire, in which the internal customs were abolished; they were called *les cinq Grosses Fermes* on account of the system of farming their taxes (see FARMING OF TAXES).

2nd. The so-called *provinces étrangères* (Britanny, Auvergne, southern France, the Franche Comté, and Flanders), which maintained their interior lines of customs.

3rd. The provinces *traitées comme pays étranger* (considered as foreign) Alsace, Lorraine, Toul, Metz, Verdun, and the seaports Marseilles, Dunkirk, Bayonne, and Lorient, which enjoyed the envied privileges of being free ports.

The enlightened views of Colbert thus only became law in the central parts of the kingdom; everywhere else he met with a stubborn resistance prompted by a perhaps justified fear of royal encroachments, by local jealousies, and also by surviving notions on the means of securing plenty, which had been dominant in the middle ages.

The system of tolls proper (*tonlieux* and *péages*) on travellers and goods by land or by water covered with an inextricable net the whole of the kingdom. Imposed by force and under the penalty of confiscation by nobles (*rouage* or *rotaticum*, *cauciage* and *carragium* on carts, *pulverage* on flocks of sheep, *pontage* or *pontaticum* on bridges, *rivage* or *ripaticum* and *mutaticum* on barges and their cargoes, etc.), and by townships (*carragium*, *portage*, and *barrage*), they were an object of unceasing complaint. Several ordinances of Louis IX., Charles VII., Louis XI. and Francis I. attempted to put limits to these

extortionate demands: new *péages* were prohibited and it was decreed that the existing ones must be sanctioned by deed or immemorial possession. An ordinance of 1561 ordered that the nobles who levied tolls were to keep the roads in repair, and another of 1663 declared that tolls might only be collected under authority of the king. The *Assemblée de Commerce*, summoned in 1700 by Louis XIV., petitioned for the suppression under compensation of all private tolls, and about 1200 were suppressed in 1724, but thousands of them still survived on the eve of the French revolution. "A barge laden with wine from Languedoc, sailing up the Rhône and proceeding to Paris by canals and the Loire, has to pay from thirty-five to forty various duties and tolls, exclusive of the tolls on the Rhône and the entry in Paris, in fifteen or sixteen different places . . . which makes the journey a fortnight longer than if all were paid at once in one same *bureau*" (from MS. in the *Archives Nationales* quoted by Taine —*Ancien Régime*, p. 471). In his *Finances de l'Ancien Régime* (i. 473), M. Stourm relates the history of a Paris commissary of police sent on an official mission to buy wine in the south, and convey it in person to Paris, so as to ascertain experimentally what were the fiscal incidents of the journey. From Roanne to Melun, about 240 miles, he had to pay 16 *péages seigneuriaux*, 7 *octrois*, without reimbursement on leaving the place, and the customs duty according to the tariff of the *Cinq Grosses Fermes* already mentioned. The honest commissary in despair did not proceed farther than Melun. Well might Necker exclaim in his *Administration des Finances:* "These laws are so confused that scarcely one man or two out of each generation succeeds in mastering them completely" (p. 473). He introduced a bill for the abolition of internal tolls and customs before the *Assemblée des Notables* in 1787, but this reform was only voted in 1790 by the national assembly considering that "these divers duties had made the different parts of the state foreign to each other."

From that day, the restoration of internal customs has never been attempted in France, although what might be called municipal customs still exist under the name of OCTROI (*q.v.*). As to the roads, the revolutionary government first tried a system of voluntary *corvées* inspired "by the generous fire which animates our free and republican souls," but as this generous fire turned out to be totally wanting, the directory, in 1797, set up turnpikes (*barrières*) on the highways: the tariff for a four-wheeled cart with two horses amounted to 80 centimes (8d.) and to 1·20 fr. (say 1s.) for spring-carriages, per 15 miles. But this imitation of the English turnpikes was not successful, and in 1806 the then minister of finance, GAUDIN (*q.v.*), had to give it up and to confess that "it excited frequent brawls, constant complaints, and that it only yielded 16,000,000 of francs, against an expenditure varying from 30,000,000 to 35,000,000" (*Notice sur les Finances*). Thus, in France at least, practical experience contradicts Adam Smith's opinions that carriages and lighters might "easily" pay for "the maintenance of public works exactly in proportion to the wear and tear which they occasion of them" (*Wealth of Nations*, bk. v. pt. iii. ch. i.). Moreover, on the roads, the expense of the collections of the turnpike dues absorbed 23 per cent of the proceeds. On rivers and canals, although it was an easier task to collect them at the sluices, where barges and lighters are necessarily detained, navigation is also free since 1880; the levying of tolls by companies or corporations who have executed public works, is quite exceptional, and must in each case be conceded by a special law. The prevailing feeling looks on the construction and repairing of roads and canals as a public service, which ought to be covered by the public revenue; however, for the latter, there were in 1889 some unavailing attempts to cause the French parliament to reconsider the question. A tax of 10 per cent on travellers' fares in public vehicles has existed since 1797; similar taxes are laid on fares and freight by rail, but these receipts have no specific allocation to the repair of roads and are included in the total revenue of the state.

Germany has, naturally owing to its state of political division, been one of the countries where the system of internal customs and tolls has received the most excessive extension. Vainly did successive diets declare that such unauthorised tolls had no legal existence; the petty princes and sovereigns persisted, and at length succeeded in obtaining the legal recognition of their prerogatives. Sometimes the different provinces of one particular state were fenced round with tolls, for instance in Prussia, where the Great Elector Frederick William (1620-1688) having introduced a system of excise varying from province to province, compensatory excise-duties (*Ergänzungsaccise*) had to be paid on the passage from one province into another. After the peace of 1815, Prussia initiated the movement of reform of German internal customs, which culminated in the conclusion of the ZOLLVEREIN (*q.v.*) and of internal tolls on the transport of goods and travellers. On the Oder about thirty provincial tolls were suppressed, numerous communal and private tolls were redeemed, and on canals the dues were henceforward calculated on the capacity of the barges and lighters, without having any longer regard to the nature of their cargoes. The same policy of simplification was from 1838 applied to roads and highways; still down to 1867 such dues as *Pflaster-*, *Brücken-*, *Damm-*, *Fahr-gelder* (pavement, bridge, dyke, pass

age tolls) were levied, besides the *Chausséegeld*, which was only abolished in 1874. (Article *Binnenzölle* in Conrad's *Handwörterbuch der Staatswissenschaften*, Jena, 1889-1890). In the states of southern Germany their suppression had taken place earlier: Bavaria and Würtemberg, 1828, Baden, 1831.

INTERNAL REVENUE TAXES IN THE UNITED STATES. In the United States this term is applied to federal taxes imposed upon domestic manufactures, trade, or income. It does not include revenue derived from sales of public lands, postal revenues, or patent fees. Internal revenue duties have been imposed at three different periods: 1791-1802; 1813-1817; and 1862 until the present time (1893). During the first period taxes were levied upon distilled spirits (1791), carriages, licenses for retailing wines and liquors, snuff, refining sugar, auction sales (1794), stamped papers (1797), and a direct tax of $2,000,000 (£400,000) (1798). The first of these duties was very unpopular in certain sections of the country, not only on account of the special burdens which were imposed upon farmers, who were the distillers of the period, but also because it was regarded as a British tax, hostile to American freedom. Opposition gave rise to the whisky rebellion in the western part of Pennsylvania. The republican party under the leadership of Jefferson was pledged to the repeal of the existing internal revenue duties; and with their succeeding to power, this was done in 1802. The necessities of war revived these taxes in the second period, and a similar reason occasioned their imposition at the beginning of the civil war. In the last period they were sweeping in their embrace; and, owing to the urgency of the times and general ignorance of the incidence of such taxes, there was frequent change and no system. The first of these measures was the act of July 1, 1862, which imposed specific and *ad valorem* duties upon manufactures, licenses upon occupations, a general income tax, and a tax upon gross receipts of transportation companies. The system was further extended by the act of June 30, 1864; and it was estimated by Mr. David A. Wells that between eight and fifteen per cent of the value of the finished product was collected by the treasury department. So productive indeed were these taxes that from 1864 until 1868 they exceeded the customs revenues. With the close of the war many of the internal revenue duties were reduced or repealed, until taxes were imposed only upon the manufacture and selling of distilled liquors, fermented liquors, tobacco and cigars, and oleomargarine.

During the first period, 1792-1801, the internal revenue duties varied from 5 to 9 per cent of the net ordinary receipts; in the second period, they constituted about 13 per cent; and since 1862 they have been one of the principal props of financial support, furnishing in recent years about 40 per cent of the net receipts. As the country has become accustomed to the taxes, and they are favourably regarded by many as desirable sumptuary regulations, they may remain for the present (see Finances, United States).

[For the early period see H. C. Adams, "Taxation in the U.S. 1789-1816," in *Johns Hopkins Studies*, vol. ii.; and for the period of the civil war, *Reports of the Special Commissioner of Revenue* (D. A. Wells) for the years 1866-68; also annual *Reports of the Commissioner of Internal Revenue* (published without Tables in the *Finance Reports*).] D. R. D.

INTERNATIONAL. See International Working Men's Association.

INTERNATIONAL COINAGE. The idea of having one and the same measure of values for all civilised nations received a strong impetus from the great exhibition in London of 1851. The difficulty then experienced in comparing the prices of similar exhibits from different countries and the values of the exhibits of one country as against those of another, led to the discussion of the possibility of establishing an international standard; the question came up at various meetings of the international statistical congress. In December 1865 France, Belgium, Italy, and Switzerland made the convention by which the currency of the Latin Union was established. In 1867 the conference at the Paris exhibition invited wider consideration of the idea thus adopted. Two delegates from Great Britain attended this conference, which recommended that a uniform gold standard be adopted by civilised countries with coins of $\frac{9}{10}$ fineness; and that the gold coins thereafter struck by countries the parties to the convention should be multiples of five francs. About the same time several countries had been making some move in the direction of assimilating their coinage to that of their neighbours.

The royal commission of 1868, which arose out of the Paris conference, marks for Great Britain the most important epoch in the history of the idea. That commission examined some of the leading economic thinkers of the day,

such as Bagehot, Jevons, and Newmarch, of whom the latter was almost alone in being very lukewarm about the matter; the principle of an international coinage was warmly espoused by several witnesses. The commission summed up the evidence as tending to show—

1. That time would be saved to all traders in calculations and comparing foreign price-lists.

2. That small traders would be relieved from a disadvantage which at present they suffered in their inability to keep a staff conversant with foreign price-lists, etc.

3. That commercial travellers would be much aided in pushing their wares.

But the commission very rightly pointed out that these advantages, even if not exaggerated, would only be obtained by complete uniformity of weights and measures as well as coins. As regards coins it stated the absolute necessity of some sort of international mints so as to assure each country that the international coins did correspond in intrinsic value with their denomination; it pointed out the necessity of a uniform charge for mintage; and after discussing the various possibilities as to the choice of a coin for a common standard, concluded that a measure which would cause so much disturbance of existing contracts, and was after all only a partial measure, could not be lightly entered into; and they reported distinctly against any suggestion that Great Britain should merely adopt a gold coin of the value of 25 francs instead of the sovereign.

Here the matter rested so far as Great Britain was concerned for thirteen years. But the conference of 1867 is thought to have borne fruit in the adoption of a gold standard by Germany in 1871, and the alteration of other national currencies. When in 1882 delegates on behalf of the British Indian and imperial governments attended another conference at Paris upon the question, the idea had taken a new turn; in 1867 the general opinion of the parties who met in conference had favoured a single gold standard; now the United States, as well as some other countries, had declared for a double standard. The possibility of agreement on an international currency was farther off than ever.

The system generally supported by advocates of change as the best to be adopted is a decimal system (see DECIMAL SYSTEM), and to some extent the movement in favour of an international measure of value became mixed up with the movement in favour of international weights and measures. Even if the principle of the decimal system be admitted, we have still to face the difficulty of electing between the two chief decimal systems of the world—those of the United States and of the Latin Union. And there is at least a question whether the mere theoretic convenience of the decimal system should weigh against other considerations, *e.g.* that of keeping in currency the most generally known coin of the world. The Commission of 1868 on that ground suggested that the sovereign was best adapted for an international standard—but they did not consider whether it should be redivided on a decimal system; this is of course a matter of pure convention.

The general objections to a change which falls with different weight on different countries are chiefly (1) the necessity of revising all contracts; (2) the expense attendant on re-coinage. They will be found well stated in the late Mr. Newmarch's evidence before the commission of 1868. We are assuming that subsidiary coins will follow the standard, and that thus one class of difficulties will disappear.

There is, however, one important point touched on by Mr. Goschen in his evidence before the same commission—viz. whether making a "coin" a universal measure will not be to substitute a token for the commodity known as gold.

The idea of an international coinage is not impossible, though at present impracticable. In the 15th and 16th centuries the Spanish dollar and Portuguese Johannes became for all practical purposes international coins, and at the present time the English sovereign comes almost as near to that ideal as the Spanish dollar did.

[The publications of the International Association for obtaining a uniform decimal system, etc., etc., especially a *Concise Narrative* by Leone Levi, 1867.—The report of the Royal Commission of 1868 in *P. P.* of 1868, vol. xxvii.—The reports of the delegates to the International Monetary Conference 1882 in *P. P.* of 1882, vol. liii.]

THE LAWS OF WAR, p. 443; 1. Preliminary Points, p. 443; 2. Enemy Persons, p. 444; 3. Enemy Property on Land, p. 444; 4. Enemy Property at Sea, p. 444; 5. Agents and Instruments of Warfare, p. 444. IV. THE LAW OF NEUTRALITY, p. 444; 1. The Nature of Neutrality, p. 444; 2. Rights and Obligations as between Belligerent and Neutral States, p. 445; 3. Ordinary Maritime Capture, p. 445; 4. Contraband Trade, p. 445; 5. Blockade, p. 445; 6. Unneutral Service, p. 446.

I. INTRODUCTION.—International Law may be defined as *the rules which determine the conduct of the general body of civilised states in their dealings with one another*. Some writers regard it as deduced from principles of natural justice implanted by the Creator in the human breast (Vattel, Wheaton, Hautefeuille), while others look upon it as a body of precepts drawn from the practice of states, and resting for their validity upon express or tacit consent (Hall, Stephen). The latter view is in accord with the facts of history. Modern international law is derived from usage, some of it extending back to remote antiquity, but most being the

growth of the last three centuries. Rules have been adopted partly because they were convenient and partly because they were deemed just and merciful. The law of nations is ultimately shaped by the public opinion of the civilised world.

II. The Laws of Peace. 1. *Independence.*—Every fully sovereign state possesses the right of managing all its affairs without interference from other states. This is called the right of independence. It is conditioned by an obligation to respect the corresponding rights of other members of the family of nations. Mutual intercourse is as impossible among states without mutual concession as it is among individuals. Political communities, like Egypt and Bulgaria, which are not allowed entire freedom of action in external affairs, cannot be regarded as fully sovereign and independent; but a state which submits temporarily to restrictions imposed by treaty is not held to have forfeited thereby its title to independence. Intervention takes place when a state interferes by force or threat of force in the internal affairs of another state, or in questions arising between two or more states. Such action trenches upon independence, and is therefore to be looked upon with grave suspicion. Each case must be judged on its own merits. Publicists differ widely as to what are lawful grounds of intervention. It is best to restrict intervention to cases where the duty of self-preservation overrides the obligation of respecting a neighbour's freedom of action. Undoubtedly a state may intervene to ward off a direct and pressing danger to its own safety or its highest national interests.

2. *Property.*—Modern international law assumes that sovereignty is territorial (Maine, *Ancient Law*, ch. iv.). States possess arsenals, museums, hospitals, munitions of war and similar objects; but their territorial possessions are by far the more important. Their dominion extends not only over the land within their boundaries and all the rivers and lakes enclosed therein, but also over the sea to the distance of three miles from low-water mark along their shores, and over the narrow bays and gulfs indenting their coast. The best rule with regard to inlets is that, if the line drawn from headland to headland across the entrance is less than ten miles in length, they are territorial waters, if more, they are a part of the open sea. In the former case the marine league is measured from the imaginary line across the opening, in the latter from the shore around the bay. The ten-mile rule has not, however, been adopted universally in practice, like the three-mile limit. The open ocean is free from territorial dominion. Its use is common to all, and none have exclusive rights within it. The old claims to dominion over large portions of it have become obsolete, the last relic of them having disappeared when the arbitrators of Paris decided, in 1893, against the claim of the United States to exercise jurisdiction in Behring Sea for the purpose of preventing vessels of other nations from catching seals therein. There is a right of innocent passage through natural territorial waters when the channel connecting two portions of the high seas runs through them. All vessels at peace with the territorial power possess it; and it has been secured as regards the artificial channel of the Suez Canal by the convention of 1888, which neutralised that water-way. Fisheries in territorial waters are reserved for subjects of the local sovereign; fisheries in the high seas are open to all. But these simple rules are often modified by treaty stipulations. If a river flows through more countries than one, it is now the custom for them to grant reciprocal rights of navigation. If a river flows between two countries, the territory of each extends to an imaginary line drawn along the middle channel (*Thalweg*).

3. *Jurisdiction.*—Jurisdiction is in the main territorial; but states have a personal jurisdiction over their own subjects wherever they may be, though it cannot be enforced if the territorial jurisdiction of any other power conflicts with it. Each state exercises authority over all persons and things within its territory, with some few exceptions. Questions of jurisdiction assume an international aspect when two states put forth conflicting claims with regard to the same individual. Thus a person born in one country and naturalised in another, may be regarded by each as its citizen; and, if he returns to the country of his birth, it may possibly deal with him in a way that causes the country of his naturalisation to interfere for his protection. England in 1870 recognised the naturalisation of her subjects abroad as depriving them of their British citizenship; and, with regard to her naturalised subjects, she protects them abroad except in the country of their birth, but there she will not interfere on their behalf unless by its law they have ceased to be its subjects. This rule avoids all trouble; but countries which, like the United States, claim to protect their naturalised subjects wherever they may be, meet with constant difficulties in the matter of compulsory military service. Latterly these have been avoided by treaty stipulations whereby the obligation is not to be enforced unless the person concerned had actually come under it before he left his native land. Citizens of one country domiciled in another must pay all state and local dues, but they cannot be compelled to serve in the army. Real property is for all purposes under the local law; but if personal property is situated in one country and its owner is domiciled in another, the *lex domicilii* (see Domicil) prevails with regard to it. A state's jurisdiction extends to all ships, except foreign men-of-war, in its territorial waters, to

all its own ships on the high seas, and to all pirates seized by its vessels. Some states follow France in declining to exercise authority over foreign merchantmen in their ports, when only the interior order and discipline of the ship are concerned. In such cases the law of the country to which the ship belongs is applied. Foreign sovereigns visiting a country in an official capacity, and the resident diplomatic agents of foreign powers, are exceptions to the rule that a state's jurisdiction extends to all persons and things within its territory. Their persons and property are inviolable. They are exempt from ordinary legal processes, and even in cases of grave misbehaviour all that can be done is to escort them out of the country. Land forces of foreign states may not enter the territory without permission; but when in it they are under the authority of their own officers. Foreign ships of war enter friendly ports without special permission. While there they are exempt from the local jurisdiction in most matters, but are bound to observe port and health regulations, and also neutrality regulations should their country be a belligerent. They may give asylum in extreme cases to political refugees and fugitive slaves, but not to ordinary criminals. The local authorities have no right to effect arrests on board. Western states have obtained by treaty for their subjects in oriental countries under native rule exemption from the local jurisdiction, and subjection instead to consular courts of their own nationality or mixed tribunals. Most civilised powers are now bound by extradition treaties to surrender to one another criminals, who, having committed a grave offence in the territory of one state, succeed in escaping to another. Political offenders are usually excepted from these stipulations.

4. *Equality.*—The doctrine of equality means that the rights and obligations of each independent state are the same, not that all are equal in influence. Since outward forms are the signs of equality or the reverse, the rules of etiquette between states are treated of under this head. Some of them regulate precedence at court ceremonials, others are concerned with diplomatic rank and the order of the signatures to international documents, while a third class deal with salutes by foreign war-vessels visiting a port and salutes between vessels at sea.

5. *Diplomacy.*—Diplomatic intercourse is now carried on by means of agents accredited by each state to its neighbours, and permanently resident at their capitals. These agents are divided into four classes: (1) ambassadors, and papal legates or nuncios; (2) envoys and ministers plenipotentiary accredited to sovereigns; (3) ministers resident accredited to sovereigns; (4) chargés d'affaires accredited to ministers of foreign affairs. The classes rank in the order given; but within each class precedence is determined by length of residence at the court to which its members are accredited. A state may refuse to receive a given individual as the diplomatic agent of another state if he is one of its own subjects, or personally obnoxious to its sovereign, or openly hostile to it or its institutions; and it may ask for the recall of a diplomatic agent, and even dismiss him, if in its opinion he has seriously misconducted himself. Such rejections are consistent with friendliness between the powers concerned, but a refusal to continue diplomatic intercourse at all is a sign of rupture and generally the prelude of war. Diplomatic ministers possess large immunities. In all matters governed by the *lex domicilii* their residence abroad is held to be a residence in their own country. Their persons are inviolable. They are free from legal processes. Their official residence may not be entered, except in extreme cases, by the local authorities, nor may their papers be seized. The members of their suite who are in the diplomatic service are free in most matters from the local jurisdiction; and their wives and children, and even their servants, share their immunities to a considerable, though not very precisely determined, degree.

III. The Laws of War. 1. *Preliminary Points.*—War is a contest carried on by public force between states, or between states and communities having, with regard to the contest, the rights of states. Private wars have been abolished in civilised countries. All wars are now public, in that they are carried on by governmental authority. There are various ways of obtaining redress by force, which are held to fall short of war, though they differ from it only in the intention of the parties. They are reprisals, Embargo (*q.v.*), and pacific blockade (see Blockade). The first involves the destruction or seizure by one state of property belonging to another in the territory of the latter or on the high seas. The second is used when the aggrieved state seizes all the ships of the offending nation found in its ports. The third is like an ordinary blockade except that the ships of third powers cannot be captured. No formal Declaration of War is necessary. The moment war begins the public armed forces on both sides are free to act, private individuals are obliged to refrain from pacific intercourse with enemy subjects, and some treaties with the enemy are abrogated, while others, such as extradition treaties, are suspended. When a province or colony revolts from the mother-country, other powers may without offence accord it recognition of belligerency, if it carries on war in civilised fashion, possesses a regular government and a fairly well-defined territory, and if the interests of the recognising state demand that it should fix the *status* of the revolted community. Such recognition grants all the rights and obligations conferred on lawful belligerents.

2. *Enemy Persons.*—Enemy subjects found within a state's territory at the outbreak of war are allowed to remain on condition that they live quietly and peacefully and give no information or assistance to their own state. A right to expel them exists; but it is rarely used, the action of the French government of national defence in expelling Germans from the department of the Seine in 1870, being the only instance in modern times. The population of the enemy's country is divided into combatants and non-combatants. With regard to the former, quarter is given when asked for, prisoners are cared for, and, if possible, exchanged, the sick and wounded are well treated and the practice of slaughtering the defenders of a fortress taken by assault has died out. With regard to the latter, they are to be protected from personal insult and injury; but, when they reside in territory in the enemy's occupation, they may be compelled to perform for him any service not distinctly military, and must give no aid or information to their own side. Women and children are sometimes allowed to leave places about to be bombarded.

3. *Enemy Property on Land.*—Real property situated in the state and possessed by enemy subjects is not confiscated or sequestrated, nor is personal property unless the proper authorities order seizure. The outbreak of war renders such property confiscable, but does not *ipso facto* confiscate it. Debts due from subjects of one belligerent to subjects of the other cannot be collected during the war, but the right to demand them revives at the conclusion of peace. Debts due from a belligerent state to subjects of the enemy are not confiscable. Movables taken in war on land are called "booty." They should be sold and the proceeds divided among all concerned according to a regular plan. If booty is recaptured before the captors have held it for twenty-four hours, or before they have brought it within their lines, it reverts to the original owners. When an invader holds a portion of his enemy's country in firm possession, he is said to occupy it. In that case he may use immovables belonging to the invaded state, and, though he may not alienate them, he may appropriate the rents and profits derived from them, unless they are devoted to the support of religion, charity, or education. State movables may be appropriated and alienated, except legal documents, state papers, works of art, and scientific instruments. Neither private immovables nor the profits arising from them may be confiscated, but military necessity justifies their destruction. Private movables are unconfiscable unless of immediate use in war. Requisitions may be levied on occupied districts, which are thereby compelled to furnish articles needed for the daily consumption of the invaders. The taxes are paid into their military chest, and sometimes further sums are exacted under the name of contributions (see ENEMY GOODS).

4. *Enemy Property at Sea.*—Maritime capture can be carried on in the territorial waters of either belligerent and on the high seas. Private as well as public property may be captured; but vessels exclusively engaged in works of exploration, discovery, or humanity, vessels engaged in coast fisheries, and vessels driven by stress of weather into their adversary's ports, are usually exempt from seizure. Moreover, in recent wars merchant vessels of one belligerent found in the ports of the other at the outbreak of war have been allowed a reasonable time to depart, and cargoes of works of art have been restored to enemy owners. And further, enemy goods not contraband laden on board neutral vessels are free from capture under the Declaration of Paris of 1856 (see article on that subject). With the exceptions just given, enemy ships, and enemy goods on enemy ships, are good prize. Belligerent cruisers have a right to stop and overhaul all merchantmen on the high seas in order to discover whether they are liable to capture. Prize Courts are established by belligerents to try the validity of captures made by their cruisers; and it is the duty of captors to bring every prize in for adjudication. But extreme necessity is held to justify the destruction at sea of vessels taken from the enemy. If captured property is recaptured, it is restored under certain conditions to its original owners. Great Britain restores if the recapture is made during the same war.

5. *Agents and Instruments of Warfare.*—Regular soldiers and sailors are legitimate combatants; but guerilla troops and levies *en masse* are held lawful only when they can be easily distinguished from non-combatants and respect the laws of war in their operations. Savage or half-civilised troops, regularly embodied and drilled, and led by civilised officers, are employed by many states. Privateers are forbidden by the Declaration of Paris; but the question of the legality of a volunteer navy, raised by Germany in 1870, has not been definitely settled. The crews of merchant ships may not fight except to resist an attack upon their own vessel. Assassination, the poisoning of food and water, and the use of poisoned weapons and of explosive bullets below 14 oz. in weight, are forbidden. Devastation of an enemy's territory is deemed lawful only when justified by overwhelming military necessity. Stratagems which involve breaches of faith are condemned.

IV. THE LAW OF NEUTRALITY. 1. *The Nature of Neutrality.*—Neutrality is the condition of those states which in time of war take no part in the contest, but continue pacific intercourse with the belligerents. Neutral governments must give no assistance to either belligerent and preserve perfect impartiality

between them. Neutralised states are those which, like Belgium and Switzerland, are obliged, as a condition of having their national existence respected and defended by other states, to abstain from warfare except in the strictest self-defence. Provinces have been neutralised, and also persons and things, such as those concerned with the care of the sick and wounded, which have been protected by the Geneva Convention of 1864. The Suez Canal was neutralised by a great international treaty in 1888.

2. *Rights and Obligations as between Belligerent and Neutral States.*—A belligerent state may not carry on hostilities within neutral territory, or use it as a base of operations, or recruit in it, or obtain supplies of arms or warlike stores for its cruisers in neutral ports and waters. Its vessels must obey reasonable regulations made by any neutral as to the length of their stay in its ports, the admission or exclusion of their prizes, and the amount of coal they may take in. If its troops are driven across a neutral frontier they must submit to being disarmed and interned. A neutral state is bound not to give armed assistance to either belligerent, nor to permit belligerent troops to march through its territory, nor to sell ships or arms to belligerents, nor to lend money to either of them, nor to allow them, or its own subjects for them, to levy troops, or fit out armed expeditions within its dominions or increase the armament or fighting crew of any vessel of war in its waters. It must restrain its subjects from engaging in the military service of belligerents within its territory or accepting letters of marque from them; and it lies under a vaguely-defined obligation to prevent the original departure from its territory of vessels built and fitted out therein for the naval service of either belligerent. The Geneva arbitration of 1872 has not cleared up this point.

3. *Ordinary Maritime Capture.*—The old rule that governed cases of maritime capture uncomplicated by special circumstances of character, destination or control, was that enemies' goods were prize, even if found on neutral ships, and neutral goods were not prize, even if found on board enemies' ships. Attempts began in the 17th century to substitute for it the rule that enemies' goods in neutral ships were not prize, and with this was joined the rule that neutral goods on enemies' ships were prize. The Declaration of Paris adopted the portion of the opposing rules most favourable to neutrals, and decreed that enemies' goods, except contraband of war, should be free under the neutral flag; and neutral goods, with the same exception, should be free under the enemies' flag (see DECLARATION OF PARIS). Neutral goods on board a belligerent cruiser are liable to capture, and they would probably be adjudged good prize if found on an armed enemy merchantman. Resistance by neutral merchantmen to belligerent search renders both ship and cargo good prize. In the absence of special agreement neutrals cannot avoid belligerent search by sending their merchantmen to sea under the convoy of their ships of war. Neutral vessels under belligerent convoy are good prize.

4. *Contraband Trade.*—Belligerents have a right of capturing on the way to the enemy such goods as are directly necessary to the conduct of his hostilities, even though they are carried in neutral vessels. The goods are called "contraband of war" (see CONTRABAND); and the offence of the neutral consists not in selling them, but in carrying them. A belligerent destination is essential; and if a merely colourable neutral destination is interposed between the port of departure and the real termination of the voyage, the doctrine of continuous voyages applies, and the goods are condemned as contraband. Articles useful primarily and ordinarily for warlike purposes, such as arms and ammunition, and the machinery for making them, are always contraband. Articles useful primarily and ordinarily for peaceful purposes, such as books, music and furniture, are never contraband. With regard to articles useful for warlike and peaceful purposes indifferently, technically termed articles *ancipitis usus*, such as clothing, food and coal, there is great difference of opinion. British and American courts and jurists favour the doctrine of occasional contraband, which makes them good prize or not according to such circumstances as the nature of the port to which they are going, the special character of the goods themselves, and the special needs of the enemy. Continental opinion inclines strongly to a restriction of the list of contraband goods, and as a rule rejects the doctrine of occasional contraband, though in 1884 France endeavoured to regard food (rice) as contraband in the course of her operations against China. The British doctrine is strongly based in reason and authority, but there can be no doubt that our courts and statesmen have sometimes given it an undue extension. The usual penalty for carrying contraband is confiscation of the contraband goods, but the whole cargo is confiscated if the proportion of contraband goods to innocent goods is large, and both belong to the same owner. The vessel also is confiscated if it is owned by the owner of the contraband goods, or if any fraudulent device, such as showing false papers, is used to avoid capture.

5. *Blockade.*—Belligerents have the right to capture neutral merchant vessels attempting to enter or leave the enemy's ports, if they are able to maintain a ship of war or a squadron in such a position that any attempt at ingress or egress is eminently dangerous. But they cannot

obtain this right by merely proclaiming a port or a coast-line blockaded, and supporting the proclamation by no force at all or by an entirely inadequate one. Such attempts are called paper blockades. When the Declaration of Paris asserted that a blockade to be binding must be effective, it did but declare an undoubted principle of international law. Military or strategic blockades are those which are carried on with a view to the ultimate reduction of the place blockaded. Commercial blockades are those carried on with the object of weakening the enemy by cutting off his external trade. They are certainly lawful; but there is a growing feeling against them caused by the fact that with modern facilities of land communication they will in most cases cripple neutral trade without inflicting serious injury upon the belligerent subjected to them. When a state establishes a blockade, it generally sends a diplomatic notification thereof to neutral governments. The British school of publicists hold this to be equivalent to notification to neutral ship-masters, but the French school require a warning to be given direct to the neutral ship-master on his first approach to the blockaded port. Thus notification has little or no effect in French practice; whereas English prize law varies considerably according to its presence or absence. The doctrine of continuous voyages applies to BLOCKADE (*q.v.*) as well as to CONTRABAND (*q.v.*). The offence of breach of blockade attaches the moment the blockade-runner leaves its own waters, and is not deposited till the end of the return voyage. The usual penalty is confiscation of ship and cargo; but, if they belong to different persons and the owner of the cargo did not know that the port of destination was blockaded, the ship alone is confiscated.

6. *Unneutral Service.*—Neutral individuals are forbidden to perform certain services for a belligerent, such as transmitting signals or messages for warlike purposes, carrying military or naval despatches, or carrying persons in the military, naval or civil service of the belligerent government. These are not matters of contraband trade. They amount to entering the service of the belligerent, though to a limited degree and for a temporary purpose. It is sometimes difficult to draw the line between what is allowed and what is forbidden in these matters. For instance it has been decided that to carry men returning from abroad to perform military duties in a belligerent army was not unneutral service, because the men were unarmed and unorganised and travelled as ordinary passengers, though cases of arms were in the hold of the vessel which took them. But it has also been decided that to carry shipwrecked officers and men of a belligerent navy home to their own country was unneutral service, because they were organised and the vessel was specially hired by their government to transport them The two important tests are the knowledge of the master of the vessel, and the character of the contract he enters into. If he knows that he is signalling or carrying persons useful in war for a belligerent, and especially if in addition he has made a special contract with an agent of the belligerent government, he will not, if captured, escape the penalty of the confiscation of his ship. Usages are growing up in favour of the exemption of duly certified and sealed mailbags from belligerent search; but at present they have not crystallised into law. Exemption has been granted in recent wars as a matter of comity.

INTERNATIONAL LAW, PRIVATE.

I. Introduction, p. 446; II. Domicile and Nationality, p. 447; III. Capacity, p. 447; IV. Minors and Lunatics, p. 447; V. Marriage and Divorce, p. 447; VI. Property and Wills, p. 447; VII. Contracts and Torts, p. 448; VIII. Limitation of Actions, p. 448; IX. Bankruptcy, p. 448; X. Foreign Judgments, p. 448; XI. Procedure, p. 449; XII. The Method of Amendment, p. 449.

I. INTRODUCTION.—Many more or less complex cases are brought before courts of law, so connected with different countries that it becomes a question of what country the law ought to be applied to them. The department of law which answers that question is called private international law, or the CONFLICT OF LAWS (*q.v.*). Its basis is sometimes said to be international comity, as if it was only through comity that a court ever applies a foreign law. But this is not so. Suppose, for example, that the heirship to an estate in England depends on the validity of a marriage which took place

in Scotland. The English court is impelled by much more than comity to apply Scotch law, and not English, to the question whether that marriage could be valid without the presence of a clergyman or a registrar. The selection of a law is itself matter of legal principle, which ought to lead to the same selection being made in all countries. And to a great extent that result is attained, but in many cases the selection is so difficult that neither all countries, nor all judges and authors in the same country, are agreed on it. The subject is eminently one which lies *inter apices juris*. As may be seen from the example just given, the questions dealt with in it arise not only between independent states, as France and Italy, but also between different parts of the same state possessing distinct systems of law, as England and Scotland. And the principles, and the solutions to which they lead, are the same for both cases, so far as circumstances permit.

II. Domicile and Nationality.—Domicile and political nationality occur so frequently among the circumstances determining the selection of a law that the careful examination of those two characteristics, with a view to the classification of persons by them, is considered to be a branch of private international law. Domicile is divided into that of origin and that of choice (see Domicil). Without going into all the distinctions necessary in practice, the former is the domicile which a person derives at his birth, usually from his father, and the latter is that which a person of full age establishes for himself by fixing his residence within a certain jurisdiction, with a sufficient character of permanence. There is on the continent of Europe a wide and growing tendency to substitute political nationality, as a determining element in the selection of a law where a person is concerned, for domicile, which is the older criterion. English judges have not followed that movement, and, even where it prevails, no test but domicile can be applied to distinguish persons who, within the same independent state, belong to parts possessing distinct systems of law, as Englishmen from Scotchmen, Austrians from Hungarians, or men of New York from Pennsylvanians. The law which belongs to a person, and the jurisdiction to which he is subject, either on the ground of his domicile or on that of his nationality, are called his personal law and jurisdiction. That term, for the purposes of the English courts, means the law or jurisdiction of the domicile, even although the person in question is of British nationality, but has a non-British domicile. In certain other countries—France, for instance,—the personal law or jurisdiction is taken to be that of the nationality, subject to the necessity of using domicile in order to distinguish persons of, say, British nationality into Englishmen, Scotchmen, South Africans, or others.

III. Capacity.—This may be absolute or relative. The question whether a person is of the age required by law to make a will, marry, or conclude any other contract, is one of absolute capacity; that of whether two persons are incapable of marrying one another on the ground of consanguinity or affinity is one of relative capacity. Both kinds of capacity have usually been referred on the continent of Europe to the personal law, and in England also the capacity to make a will has always been referred to the law of the testator's domicile. But in England formerly the capacity, whether absolute or relative, for marriage or any other contract, was referred to the law of the place where it was entered into, the *lex loci contractus celebrati;* and so it still is in the United States. Now, however, Lord Westbury, Lord Justice Cotton, and Lord Halsbury, have pronounced that capacity depends entirely on the law of the domicile.

IV. Minors and Lunatics.—The guardians and curators, whether of the person or of the estate, appointed for a minor or a lunatic by the jurisdiction which claims him on the ground either of his nationality or his domicile, can exercise their functions in England, both as to his person and as to his movable property. But the English court also has jurisdiction, and can appoint guardians or committees, though it will only do so in aid of the foreign jurisdiction, so long as the appointees of the latter are not abusing their powers.

V. Marriage and Divorce.—The validity of a marriage, as regards the form of its celebration, like that of any other contract, is universally held to be governed by the law of the place of celebration. We have seen the rules as to the capacity of the parties.[1] Divorce has been granted in England when the husband, whether petitioner or respondent, is resident here, though his residence may not amount to domicile; but the English court shows a strong tendency not to recognise the divorce of persons domiciled in England, when decreed by a foreign court on the ground of mere residence, and since the decision in *Le Mesurier* v. *Le Mesurier*, June 1895, it is probable that in future it will only be granted in England to persons domiciled here. The place where a marriage was contracted is immaterial in a suit for divorce, and the grounds for decreeing divorce can only be those which are admitted by the law of the country in which the court sits, the *lex fori*.

VI. Property and Wills.—Property is divided into movable and immovable, terms which are equivalent to our personal and real estate, except that terms of years in land are immovable property though personal estate in England. This line of demarcation between movables and immovables is recognised for the purposes of private international law even in England.

A distinction must be drawn between questions affecting a particular piece of property, movable or immovable, and those affecting the entirety of a person's property, or of the movable part of it, on the occasion of his marriage or death. The former class of questions, as, for instance, the form and effect of a conveyance of land, or the

[1] One consequence of those rules is that a man domiciled in England gains nothing by going through the form of marriage with his deceased wife's sister, even in a European country where such marriages are allowed to its own subjects. The relative capacity being generally tested in Europe by the personal law, it will not be a marriage even where the form is gone through, unless the parties have previously naturalised themselves there, or transferred their domicile to that country, which would be incompatible with the intention of returning to live in England.

conditions necessary for passing the property in a lot of deal planks, are decided by the law of the country where the piece of property is, the *lex situs*. As to the latter class of questions, the oldest rule, still maintained in England, determined the rights which husband and wife take in one another's movables on marriage by the law of their domicile, which is necessarily that of the husband, and determined the beneficial succession to the movables of a testator or intestate by the law of his last domicile, but left similar questions for immovables to the *lex situs*. Now, however, there is a growing tendency on the continent to consider that the whole mass of a person's property, immovable as well as movable, ought to be dealt with on his marriage or death as a unit, in accordance with his personal law.

What has been said as to the beneficial succession to movables on death being governed by the law of the deceased's last domicile (or nationality) applies, as a general rule, to distribution on intestacy and to the validity of wills in matters of substance, such as the proportion of his property of which a testator can dispose, or the extent to which he may tie up his property. The formal validity of a will, as with respect to the number of witnesses, or to its being notarial or holograph, has usually been referred on the continent, in common with the forms of contracts and acts in general, to the law of the place where it is made, the *lex loci actus*. But the old English practice required that a will of movables should be made also in the form of the domicile, so that both in this case and in that of contracts it took the peculiar line of determining both formal and substantial validity by the same law, though with this difference, that in contracts the rule for the capacity was taken from that for the form, the law of the place of contract, while in wills the rule for the form was taken from that for the substance, the law of the domicile. But now, by Lord Kingsdown's act, a will of personal estate will be held in the United Kingdom to have been well made if it follows the form either of the testator's last domicile, or of the country in which he was domiciled when it was made; or, if he was a British subject, that of the place where it was made; or, if such British subject made it out of the United Kingdom, the form required in that part of the British dominions in which he had his domicile of origin.

VII. Contracts and Torts.—The validity of a contract in point of form is determined by the law of the place where it was made, except that foreign stamps are not required in England on bills of exchange. In other contracts it is agreed that foreign stamps, which are necessary to their validity where made, cannot be dispensed with; but that principle is frittered away in England by a doctrine that a contract may be valid although, for want of a stamp, no available obligation arises from it.

The intrinsic validity and the effects of a contract are determined by the law of that country with which the contract has the most real connection, especially by the law of the country to which the parties looked as that in which it was to be fulfilled.

In order that an act may be sued on in England as a Tort, it must be a tortious one both by the law of the country where it was done and by English law.

VIII. Limitation of Actions.—No part of private international law presents more difference of doctrine between authors, or more difference of practice between different countries, and between different periods in the same country, than this. In England it is settled that the time of limitation is always the English one, and within that time actions are entertained on contracts or tortious acts, though barred by the law of the country to which the contract properly belonged or where the act was done, and after that time are not entertained, though the obligation from the contract or tort is in full vigour in that country.

IX. Bankruptcy.—There has always been a considerable body of opinion in favour of bringing all the assets and all the liabilities of a bankrupt into one focus at his domicile, but this has been resisted not only, as in the somewhat parallel cases of marriage and death, by the theoretical objection to comprising immovable assets in the principle, but also by the practical convenience which is often found in having concurrent bankruptcies in the different countries where the debtor has carried on business, instead of sending all the creditors to his domicile, from which they may be very remote. In England every one is subject to be adjudicated bankrupt who is domiciled here, or within the last year has ordinarily resided or had a dwelling-house or place of business here; that he has been made bankrupt elsewhere does not prevent his being adjudicated one here, if it seems expedient to the court that this should be done; the syndics, or other administrators appointed in a bankruptcy in the debtor's domicile, can sweep his movable property in England within their administration, so long as there is no concurrent bankruptcy against him here; an English creditor must hand over to the trustees in an English bankruptcy any payment which, after its commencement, and not by virtue of any security given prior to its commencement, he has obtained out of the bankrupt's movables in a non-British country; and a discharge under the bankrupt law of a foreign country will only relieve the debtor, in England, from contracts governed as to their effects by the law of the same country, and from torts committed in it.

X. Foreign Judgments.—A foreign judgment, for a sum of money, can be sued on in England when the court which pronounced it was competent by reason of the defendant's being either a subject of that country by nationality, or domiciled in it, or resident in it in a sense looser than that which is needed for domicile but such as is generally sufficient for jurisdiction. All these are grounds of competence having reference to the defendant's person, and are admitted as such everywhere. Where the competence of the foreign court was founded on the circumstance that the obligation sued on had special reference to that country, there is no equally general acceptance of definite rules for jurisdiction, and the English court will not now admit an action on the foreign judgment. In any case where the competence of the foreign

court is admitted and the action entertained, the foreign judgment will be allowed the force of *res judicata*, that is to say, the defendant will not be allowed to dispute it, for alleged error either of fact or of law. The courts of many countries entertain actions not resting on any of the grounds of competence above mentioned. In France, for instance, a Frenchman can sue, although both the defendant and the obligation may have no connection with France. But the judgments in such actions will not be enforced in any other country than that in which they are pronounced. The grounds above mentioned are the only ones of what may be called international competence.

XI. PROCEDURE.—This is always governed by the *lex fori*; that is to say, every court follows its own procedure, and no other, whether in rules of evidence or in any other particular.

XII. THE METHOD OF AMENDMENT.—We must warn the reader that our limits have only allowed us to present a selection of important points, and to treat them especially with reference to the rules prevailing in England, and in a very general way even with reference to those rules. We hope, however, that enough has been said to show how desirable it is that the subject should be settled on a uniform basis for all countries, and how hopeless it is that such a result should be attained except by international agreement. Doctrinal discussion has been at work for seven centuries, with no further result than we have seen. Governments have therefore been at last impelled to take up the subject, and in September 1893 the delegates of fourteen countries met at the Hague, on the invitation of the Netherlands, in a conference on the codification of private international law. In June 1894 the conference reassembled, the delegates of sixteen countries taking part, and a portion of the work, amounting to fifty-nine articles, has been drafted and submitted to the respective governments. It is much to be regretted that the British government declined the invitation to the conference (see CONFLICT OF LAWS).

[The following are a few of the principal works. W.

INTERNATIONAL SECURITIES. A certain number of stocks and shares are dealt in indiscriminately: on the London market, on the Paris bourse, on the exchanges of Germany or Austria, on those of Holland, and even in New York. The ability of holders to realise in any of these markets, or in that one out of several which may happen to be the best for his purpose, puts such stocks into a different category from those which depend upon a single local and limited market. To give instances, the bonds of the French or Italian governments are dealt in freely on most of the European exchanges, and of Italian bonds it might be said that the best market is almost anywhere outside Italy. The *locale* of market for specific government bonds changes from time to time. Thus, since Russia grew, or was thought to have grown inimical to England, Russian bonds were gradually realised here and sent to Germany or Holland or France; and, whereas Germany was the chief market for Russian securities, after London had lost taste for Russian stocks, France afterwards stepped in and by degrees relieved German holders of a large portion of the Russian sterling bonds which had been bought in Berlin, Frankfort, and on other stock markets of Germany. The shares and bonds of the South Austrian Railway Company (formerly Lombardo-Venetian) were at one time a favourite medium of remittance between markets, these being realisable not only in Vienna, but just as freely in Berlin or Paris or London. Of late years certain American railroad shares have taken the rank and distinctive features of international securities, and bankers have been heard to declare that they would rather advance money upon American railroad shares which carried no dividend, and which might be thought intrinsically valueless, but which could be realised in almost any great market of the world at a pinch, than lock up money in British Colonial stocks for which the market was confined to London, and was not always a free market even on the London stock exchange. A large part of the remittances between countries is now conducted by means of the purchase and sale by *arbitrage* dealers of these international securities. Nothing can be more prompt than the execution of an order by telegraph to buy or sell in Paris securities which were sold or bought against those operations in London, for example. These arbitrage dealings have a strong influence on the exchanges. Thus, suppose money is scarce in London and plentiful in Paris, the scarcity here naturally induces holders of French or other bonds to realise. The pressure to sell in this market reduces the price in London below the equivalent on the Paris bourse. Instantly the arbitrage dealer sees his opportunity, buys here—in the cheaper market, that is—and sells in Paris, which is contemporaneously the dearer market. The French exchange on London thereupon tends to rise, and cash drifts hither if the operations described are sufficiently large and numerous (see ARBITRAGE). A. E.

INTERNATIONAL TRADE. A term used to describe commercial dealings between different countries, as opposed to those taking place within a single country or region. The separation between foreign and domestic trade, due originally to the importance attributed to the former in the MERCANTILE SYSTEM (*q.v.*), has been re-

tained on scientific grounds. There is not such facility for moving labour and capital from country to country as would equalise wages and profits, while the effect of cost of carriage and other obstacles to exchange is very prominent. The ordinary theory of exchange therefore failing to completely interpret the facts, a special explanation is needed, the outlines of which are :—

The difficulty of moving labour and capital is regarded as the cause of the peculiar features of foreign trade. "A nation in the economic sense is a group of producers within which labour and capital freely circulate" (Bagehot), while they do not easily pass outside it. This relative immobility, sometimes regarded (*e.g.* by J. S. Mill) as the result of distance solely, seems more correctly conceived by Cairnes as the product of all the forces—"viz. geographical distance, differences in institutions, language, religion, and social customs"—which separate the economic groups called "nations." As labour and capital cannot move freely from country to country, normal international values will not depend on cost of production, the existence of industrial competition being requisite for the full operation of that regulator. Nevertheless exchanges between countries will be advantageous owing to (1) diversities in natural resources, and (2) the existence of special industrial aptitudes, the result of social development. Though cost will not determine value, it will not be without effect on the course of trade. "The existence of international trade" depends on "a difference in the comparative as contradistinguished from the absolute cost of producing the commodities exchanged" (Cairnes). If, *e.g.*, England gives France coal in exchange for wine, the cost of producing coal as compared with wine must be less in the former than in the latter country.

It is conceivable that both coal and wine may be more cheaply produced in France, but the advantage being greater in the case of wine, it is profitable to obtain coal by means of exchange ; thus a difference in *comparative* cost of producing commodities will suffice to create a trade in them, unless (*a*) the hindrances to exchange be such as to absorb the gain, or (*b*) other countries offer more favourable terms. Cost of production, *so far as it is operative within the trading countries* (see COMPETITION AND CUSTOM) acts as a limiting force on foreign trade. Within the bounds set by comparative cost exchanges are mainly governed by the strength of reciprocal demand (see INTERNATIONAL VALUE).

The benefit of international as of all exchange lies in the increased enjoyments of the exchangers and therefore in the goods received, *i.e.* the only direct advantage of foreign commerce consists in the imports (Mill). Exports are merely the price or consideration paid for what is obtained by these means, a proposition which follows from and illustrates Adam Smith's maxim, "Consumption is the sole end and purpose of all production . . . a maxim so perfectly self-evident that it would be absurd to attempt to prove it."

The general gain of foreign trade can be further divided into, (1) the obtaining of articles which could not be produced at home ; (2) the cheapening of goods which could be so produced but at greater cost ; (3) the more efficient distribution of industrial forces and consequent larger production by the extension of "the territorial division of labour" (Torrens), the last chiefly found in the case of manufactures.

Possible evil results should in theoretical discussion be noted, viz. (1) specialisation of industry, of which foreign trade is but one form, increases the chance of so-called over- (really *mis-*) production. It is more difficult to gauge the amount of product required in a widely extended market ; and such disturbances as wars and failure of crops may produce serious effects. (2) The extension of international exchange may intensify the action of the "law of diminishing returns." In the case of a food-exporting country increased foreign trade is equivalent to an increase of population. When the product is an exhaustible one (*e.g.* English coal or Peruvian guano), the evil is more apparent (cp. Jevons, *Coal Question*, pp. 370 *seq.*). See MINES AND MINERALS, EXHAUSTION OF.

In interpreting the facts of international trade, valuable assistance is afforded by the proposition that "gold and silver having been chosen for the general medium of circulation, they are by the competition of commerce distributed in such proportions amongst the different countries of the world as to accommodate themselves to the natural traffic which would take place if no such metals existed and the trade between countries were purely a trade of barter" (Ricardo). Its truth is shown by considering that any other distribution would be unstable, as either export or import of bullion would be necessary ; it is in fact a special case of the general law that relative prices must be adjusted to relative values.

Until this proposition was formulated "the theory of foreign trade was," as Mill justly remarks, "an unintelligible chaos." By its aid the problems of international trade and values are freed from a complicating element. The precious metals can be regarded as simply an instrument for facilitating exchanges ; normal values are not altered by their fluctuations (see MONEY), which only affect *prices*. Monetary changes, like any other trade disturbance, may be followed by temporary movements, which however do not invalidate the general principles.

The actual working of international trade is carried on by means of the FOREIGN EXCHANGES, (*q.v.*) supplemented by telegraphic facilities and the modern developments of BANKING (*q.v.*), but as in the case of money these agencies alter no essential feature. The fundamental conditions

of exchange hold good alike under a "barter," "money," or "credit economy."

The above outlined theory furnishes a logical basis for the practical rule of FREE TRADE (*q.v.*). "To those who accept the economic theory of international trade, no further proof of the essential soundness of this fundamental principle of commercial policy is needed" (Cairnes, cp. Cherbuliez, t. 2, p. 55), though particular theoretical exceptions may be suggested (cp. Mill, *Principles*, bk. v. ch. 10, § 1; Sidgwick, bk. iii. ch. 5). It may also be usefully employed in discussing the effect of taxation on imports and exports (cp. Mill, *Essays* and *Principles*, bk. v. ch. 4, § 6).

The theory of international trade first stated by Ricardo, more elaborately developed by Mill and Cairnes, may be regarded as the recognised English doctrine, though there are some dissentients (*e.g.* Mr. M'Leod), and even those who do not reject the theory, sometimes, with Prof. Sidgwick, minimise its importance. On the continent it has not met with much acceptance, being either ignored or controverted. The principal objections may be grouped as: (1) international does not differ from domestic trade, and therefore needs no special explanation; (2) the assumptions made are incorrect, so that the conclusions do not interpret the facts (COURNOT, *q.v.*); (3) though logically correct, they have no application to the complications of actual trade (Lexis). Some continental writers have however given admirable expositions, especially A. E. Cherbuliez.

INTERNATIONAL VALUE, THEORY OF. The problem of international *value*, as distinct from that of international *trade*, deals with the question, "On what principle is the increase of wealth which results" from foreign trade "shared amongst the nations which co-operate in producing it?" Or, since the division of gain depends on the ratio of exchange, "What causes determine the proportions in which trading nations exchange their products" (Cairnes). Its solution depends on an application of the fundamental principle of supply and demand. Under INTERNATIONAL TRADE (*q.v.*), it appeared that the terms of exchange must lie between limits fixed by the relative costs of producing the exchanged goods in the trading countries. Thus if the production of 10 yards of cotton yarn or of silk requires a given cost in France, while 20 yards of cotton-yarn can be produced in England at the cost of 10 yards of silk, the exchange of English cotton-yarn for French silk may be profitably carried on at any ratio between 10 yards silk: 10 yards cotton-yarn, and 10 yards silk: 20 yards cotton-yarn. Less than the former France will not take, more than the latter England will not give. Within these bounds the rate of exchange will depend primarily on the comparative strength of demand. Should the English demand for silk be keen, while that of France for cotton-yarn is feeble, the terms of exchange will probably approach to 10 yards silk for 20 yards cotton-yarn, the precise ratio being so fixed as to equalise the reciprocal demand for the exchanged commodities: *e.g.* if, at the ratio 10 yards silk: 19 yards cotton-yarn, England takes just 100,000 yards silk and France 190,000 yards cotton, the "equation of international demand" (J. S. Mill) will be attained, and so long as the conditions are unchanged the ratio will be stable. An increased demand on the part of either country will tend to alter the terms to its disadvantage—suppose that France needs more than 190,000 yards of cotton she will have to offer say 10 yards silk for 18 yards cotton, and the amounts exchanged may be 110,000 yards silk for 198,000 yards cotton-yarn, which will again equalise reciprocal demand.

In the simple case supposed the equation of demand is not determinate; "several different rates . . . may all equally fulfil the conditions. . . . It is conceivable that they might be equally satisfied by every numerical rate which could be supposed" (J. S. Mill). This theoretical indeterminateness may be removed by taking into account for each country "the capital which it has to spare from the production of domestic commodities for its own consumption" (Mill), or by remembering that as the demand on each side is that of a whole country, it will not be likely—as Cairnes points out (*Leading Principles*, 1st ed. p. 103) in the similar case of reciprocal demand between non-competing groups—to be easily altered.

Hindrances to exchange, such as cost of carriage, unnoticed in the preceding remarks, reduce its advantage and cause a divergence of values in the trading countries. In the absence of impediments, values must be the same in both, but cost of transport and all similar items will raise the value of each commodity in the importing country, so that, *e.g.*, silk will be dearer in England and cotton-yarn in France. The division of this charge will depend on the readjustment of demand which the change in values will

probably produce, and, as there is no precise law for the variations of demand, any change in the amount of hindrances to exchange, will be likely to alter the terms already established, and therefore the proportion of gain derived; "but no absolute rule can be laid down for the division of the cost any more than for the division of the advantage, and it does not follow that in whatever ratio the one is divided the other will be divided in the same" (Mill).

In practice countries will generally trade not in *two* but in many commodities. "Those articles in which the difference in comparative cost is greatest will first enter into international commerce;" but as obstacles to traffic are reduced additional commodities will be exchanged—"a movement which tends to extend until no goods remain whose transfer would give an advantage to either of the parties" (Mangoldt). The extension of trade makes value more stable, and tends to bring about a fairer division of gain, *e.g.* the French demand for cotton-yarn may be feeble while that of England for silk is strong, but the addition of iron and coal to English exports will act on the total French demand and improve the position of England.

Commerce moreover is not limited to two nations. Most staples are produced in more than one country, and are traded in by many. The consequence is a further limitation on the possible fluctuations of value. To the small French demand for cotton a German one may be added, and the advantage of France in the exchange of silk may be reduced by the competition of Italy as a producer of that article. Commodities the subjects of foreign commerce have their values fixed in the market of the world, local deviations being the result of particular hindrances to trade. International values lie "in the region of the most complicated questions which political economy affords" (Mill), and can only be elucidated by use of the principle that "trade among any number of countries, and in any number of commodities, must take place on the same essential principles as trade between two countries and in two commodities" (*ib.*) (cp. Jevons, *Theory*, 2nd ed. p. 124).

International prices have to be carefully distinguished from international values. Prices tend to adjust themselves to values (see INTERNATIONAL TRADE) by the alterations in distribution of the precious metals. Price—the value of money—is a special case of the value problem. The precious metals have their international value fixed by the same conditions as those obtaining in the case of other commodities. "The countries whose exportable productions are most in demand abroad and contain greatest value in smallest bulk, which are nearest to the mines, and which have least demand for foreign productions, are those in which money will be of lowest value" (Mill), this lower value being the result of increased quantity. The theory of international value due in its main features to J. S. Mill has been severely criticised by Cournot and in England by Prof. Sidgwick, who regards "the division of the double cost of carriage which trade involves between the two sets of commodities" as "the question which a special theory of international values has to answer." On the continent it has been neglected by most text-book writers. According to M. Block, "*Les économistes du continent ont bien fait de laisser 'la théorie de la valeur internationale' de l'autre côté de la Manche*" (*Science Économique*, ii. p. 172). Cherbuliez, Mangoldt, and Beaujon are, however, exceptions. The prevailing view in England and the United States may perhaps be summed up in Jevons's judgment of Mill's theory as being "always ingenious and . . . nearly always true" (*Theory*, 154).

INTERNATIONAL WORKING MEN'S ASSOCIATION, THE. This association, which came to be generally known by the abbreviated title of "The International," was founded in 1864. Its origin was very different from its ultimate development. It was suggested by some representatives of English working men in an address presented to some French workmen who had come over on the instance of the Third Napoleon to visit the London exhibition of 1862. It was suggested as a means of interchange of thought and opinion on the solution of the labour problem, among other economic questions affecting the welfare and condition of society. It was suggested as a means of creating an union of interest and feeling between the working men of different countries. It had apparently in its origin no definitely socialistic aims, it even held that the socialist schemes, which had been professedly put forward as solutions of the labour problem, were idle chimeras and magnificent dreams. But, as soon as the suggestion took practical shape, the committee which was formed requested Karl MARX (*q.v.*), the author of *Das Kapital*, to draw up the programme and to prepare the statutes of the association. He impressed upon it from the outset the stamp of his own socialistic views; and, although throughout its history he never held any higher office than that of corresponding secretary for Germany, he seems to have exercised a predominant influence over its deliberations and acts. The statutes,

which were adopted at the congress held at Geneva in 1866, declared, in the characteristic language of modern scientific SOCIALISM (*q.v.*) that the "economic subjection of the labourer to the possessor of the means of production is the first cause of his political, moral, and material servitude, and that the emancipation of labour is consequently the great aim to which every political movement ought to be subordinated." This phrase of the "emancipation of labour" was conveniently ambiguous, and was interpreted differently by the workingmen members of different countries. The English trade-unionists saw in it far less than the Russian nihilist BAKOUNIN (*q.v.*), who merged his more violent "Alliance of Socialist Democracy" in the larger organisation of the International; but for some years a working basis of agreement was found by cherishing a distant ideal of a revolutionary nature at the same time as immediate practical aims of so comparatively moderate a character as free education, gratuitous justice, and a normal working day of eight hours, were sought to be accomplished. The association held periodical congresses in various towns, and gained a footing in different countries. In Belgium it had as many as eight federations of associations, and several journals; in Holland it possessed a branch in almost every town in 1869, and in Spain its organisation extended throughout the length and breadth of the country and comprised a membership of more than 300,000. It did not spread in Norway or Sweden, nor yet in Switzerland, although its congresses were not unfrequently held in the last-mentioned country. It exercised, M. de Laveleye observes, little real influence in Germany or in England, but in the latter country it obtained the nominal adhesion of 30,000 trades-unionists represented at the Trades Union Congress of 1867. From the first there were discordant elements in the association, and after the revolution of the COMMUNE OF PARIS, which followed the Franco-German war, and met with the approval of the leaders of the International, the English members dropped off. At the first congress, which was subsequently held, at the Hague in 1872, the association broke up into two rival factions on the questions of the nature of the political constitution of the society of the future, and of the means by which that new society was to be substituted for the present *régime*. The centralist democratic socialists, led by Marx, were in favour of centralised authority, the anarchic socialists, led by Bakounin (see NIHILISM), disliked central government and favoured the old communal system. The former advocated legal and peaceful organisation, and a gradual though inevitable evolution from the old order to the new; the latter urged revolution. Bakounin was expelled from the association; and for a time two separate organisations maintained a lingering existence and then died away. The connection of the English trades unions with the International had never been very close, although the first president was Odger, a noted unionist leader, and the first secretary, Cremer, another unionist leader of repute. There can indeed be little doubt that generally the International possessed far less power in reality than that with which it was commonly credited. But it certainly inspired wide-spread alarm. It was joined for a short time by the Italian Mazzini. It was suspected of being the real author of the Paris Commune. It has been the subject of a parallel between itself as the Red and the Roman Catholic church as the Black International. Its first manifesto concluded with the words "Proletarians of all countries, unite," and from its outset it aroused the repressive hostility of the governments of France, Italy, Austria, and Spain.

INTERPLEADER. Where a person is under liability for any debt or goods in respect of which he expects to be sued by two or more parties making adverse claims thereto, he may bring the adverse claimants before the court, or compel one of them to relinquish his claim by a mode of procedure called "interpleader." The same mode of procedure is available for a sheriff or sheriff's officer taking goods in execution which are claimed by a third party.

INTERRUPTION OF PRESCRIPTION. See PRESCRIPTION.

INTERSTATE COMMERCE LAW (U.S.A.). The constitution of the United States, while leaving to the authorities of the several states the right and duty of controlling the operations of common carriers, reserves to congress the right to regulate commerce between the states. When the constitution was framed, this provision was chiefly intended to prevent the individual states from erecting custom-houses on their borders, or in any wise taxing the business which should originate in other parts of the union. But as time went on it began to have an important bearing on railway regulation. For the through or "interstate" traffic tended to increase in volume faster than the local or state traffic, until, in 1886, it furnished from three-quarters to nine-tenths of the business and the revenue of many leading lines. Under these circumstances, local legislation which could only affect a small part of the traffic of such lines was obviously of little

use; more especially since fairness in railroad rates is a relative matter, and the justice of a local charge depends not alone on conditions affecting that shipment by itself, but also on the scale of charges adopted for through traffic on the same line.

The United States courts did all that they could to meet this difficulty; but there was a clamour for legislation which should settle the principles to be applied more definitely and speedily than the courts were likely to do if left to themselves. The first attempts to secure such legislation were made in 1873; but it was not until 1878 that a systematic and continuous agitation of the subject was begun, which finally led to the passage of the Interstate Commerce Act nine years later. In 1878, Mr. Reagan of Texas, formerly postmaster-general of the confederate states, introduced a bill providing for the adoption of equal mileage rates on all the railroads of the country. Such a proposal was obviously impracticable, and was successfully resisted by the railroads. In subsequent years Mr. Reagan introduced a succession of bills, each a little more moderate than its predecessor, but all endeavouring to subject the railroads to somewhat arbitrary regulations which would have interfered with the successful conduct of their business.

The division on these Reagan bills was based not on party, but on locality. They found their chief support in the south and west, where there are many shippers and few shareholders; while they were opposed in the central and eastern states, where the railroad capital of the country is chiefly owned. These bills also commanded much stronger support in the House of Representatives than in the Senate, because the latter body is largely composed of men who are themselves property-owners on a considerable scale, and understand the fatuity of laws aimed to restrict investors' profits in any radical fashion.

Down to 1885 the moderate party was strong enough to defeat all legislation. But it had become obvious by this time that the public demanded the enactment of a law of some sort, and that it was futile to resist such a demand much longer. Accordingly the United States Senate appointed a special committee under the chairmanship of Mr. Cullom of Illinois to investigate the situation and draft a bill.

Their report was made in 1886; their bill provided that all traffic of any given kind was to be charged the same rates under substantially similar circumstances and conditions; that is, that personal preferences of every kind were to be declared illegal. It further prohibited the worse sort of local preferences by providing that through traffic should not be given a lower aggregate rate than the traffic to and from intermediate points. It made provision for certain exceptions to this rule by appointing a commission which should have discretionary power to suspend its operation in certain specific cases.

Only on the first of these points was the report of the Senate committee satisfactory to the advocates of the Reagan bill. In the matter of local preferences, they wished to secure something much more nearly approaching equal mileage rates. The establishment of a commission with power to make exceptions seemed to them likely to make the whole law nugatory, and they were therefore opposed to its creation. On the other hand they were extremely anxious to prohibit divisions of traffic or earnings, known in America as POOLS. They feared that if competition could be restricted by these agencies, the railroads would comply with the law by raising their through rates instead of lowering their local rates.

The views of Mr. Cullom prevailed in the Senate, those of Mr. Reagan in the House. Early in 1887 a compromise was finally adopted, prohibiting pools, creating an interstate commerce commission, and wording the section with regard to local discriminations or preferences so ambiguously as to leave grave doubts as to what it actually meant. This compromise bill became law February 4, 1887, and constitutes what is known as the Interstate Commerce Act.

The ambiguity of the section concerning local discrimination placed upon the interstate commerce commission the somewhat unforeseen duty of making a provisional interpretation of its doubtful points. This interpretation, popularly known as the Louisville and Nashville decision, was made in so able a manner as to command universal respect, and was reported and quoted exactly as if it were a judicial opinion. This led to a demand for similar opinions on the part of the commission on other points connected with the operation of the law. The commission was composed entirely of lawyers, and this work of interpretation was perhaps more congenial to them than some of the other duties contemplated by the Act. This became their important work, which they did in person, while other functions were relegated to subordinates. At first their success was phenomenal. Their decisions were marked by moderation and good sense, and bade fair to create, with unexampled ease, a large body of transportation law. But the commission, as was perhaps natural, undertook a little more than it was likely to be able to carry out under the most favourable circumstances; while the retirement of Mr. Walker and the illness of Judge Cooley deprived it of the services of its two most active members. It was drawn into an attitude of hostility to the courts in certain questions of jurisdiction; and hence the influence of the commission is not so great as it seemed likely to be a few years ago.

With regard to the benefit derived from the operation of the law, there is considerable difference of opinion. It is generally thought that there are much fewer discriminations or preferences than there were when the act was passed, and that those which continue to exist are of a less glaring character. There is more publicity both of rates and of accounts than before the passage of the act. On the other hand the clause prohibiting pools has proved decidedly harmful. It has combined with several other causes to produce a good deal of depression in American railroad profits; it has more than once put responsible railroad men at the mercy of irresponsible ones; and it has prevented the development of far-sighted schemes of railroad policy which would do as much good to the shippers as to the companies. At present the prohibition is pretty generally evaded; but efforts to secure its repeal have thus far been unsuccessful (see also RAILWAYS).

A. T. H.

INTESTACY (ENGLAND). In the case of a person dying without having left any directions as to the disposal of his property answering the requirements of a valid will, or having left a will the directions of which do not deal with the whole of his property, there is said to be an "intestacy." In most countries the devolution of property as to which a person dies intestate does not depend on the nature of the property; but in England a distinction is drawn between real and personal property—real property going generally to one person, called the "heir-at-law," and personal property being generally divided among several persons, collectively called "the next-of-kin," subject in both cases to any rights a surviving husband or wife may be entitled to. The rules for ascertaining the heir-at-law and the next-of-kin in a given case are too complicated to be stated here. It is sufficient to mention that if an intestate dies leaving several sons and daughters, his real estate goes to his eldest son and his personal estate is divided among all the children, the issue standing in a deceased parent's or ancestor's place. If he leaves daughters only they all take the real estate as COPARCENERS (*q.v.*). The preference of the eldest son and his issue in the case of real estate, when spoken of in political pamphlets, is generally described as the "rule of" PRIMOGENITURE. The importance of the rule and its injustice have often been exaggerated; but although the attacks against the rule have to a certain extent subsided, there is no doubt that the time when the devolution of real property will be made equal to the devolution of personalty cannot be far distant. It should be pointed out that the general rules as to the descent of real property are in some places displaced by local custom (see BOROUGH ENGLISH; GAVELKIND); as to personalty, all such special customs have been abolished by the "Act for the Uniform Administration of the estates of Intestates" passed in 1857. The rights of the surviving husband or wife of an intestate are not of much practical importance as regards realty (see HUSBAND, AS TO WIFE'S PROPERTY; DOWER); the personal estate of an intestate wife goes to the husband, whether there be children or not; on the other hand the widow of an intestate receives one third of his personal estate, if there is any issue, and one half if no issue survives. It is further provided by the Intestates' Estates Act 1890 that the real and personal estate of any man dying intestate, and leaving a widow but no issue, shall, if of a net value not exceeding £500, belong to the widow absolutely and exclusively, and also that in case the net value exceeds £500, the widow shall have a charge upon the whole estate for £500.

Real property situated in England descends, according to English law, without any regard to the domicile of the owner (see DOMICILE); the devolution of personal property on the other hand is regulated by the law of the intestate's domicile without any regard to the local situation of the property (see also ADMINISTRATION, LETTERS OF; ADMINISTRATOR).

E. S.

INTIERI, BARTOLOMEO (1677-1757), was a Florentine ecclesiastic. He founded the chair of political economy at Naples in 1754—the first in Europe—under the title of a professorship of commerce and mechanics. He attached three conditions—(1) that the teaching should be entirely in Italian—this was contrary to the custom of the time, all scientific teaching being then in Latin; and was intended to obtain a wider circle of students. (2) That GENOVESI (*q.v.*) should be the first professor. (3) That after his death no ecclesiastic should be appointed to the chair.

Intieri is supposed to have assisted in suggesting to GALIANI (*q.v.*) the principles on which his work was founded (Ingram, *History of Pol. Ec.*, p. 72). His influence over economics was therefore considerable, though he left no original work of his own.

A. B.

INTRINSIC VALUE is attributed to an article when it (1) is not "spontaneously supplied by nature," but "requires labour to obtain it"; and (2) is "useful for other purposes than being employed as money" (Fawcett, *Manual*, bk. iii. ch. v.). Or one only of these attributes may form the definition; the term thus coinciding with "real value," which sometimes means the quantity of labour required for the production of an article (Ricardo, *Principles*, ch. xx. and *passim*), and sometimes "the amount of necessaries, comforts, and luxuries of life" that it will purchase (Marshall, *Principles*, p. 666).

The term, in one of these senses, is often employed in monetary theory. For instance,

Ricardo, "Gold and silver, like other commodities, have an intrinsic value" (*High Price of Bullion*, par. 1); and Fawcett, "the substance chosen as money should possess an intrinsic value."

There is no objection to this terminology, if it does not suggest the misconception that all value is intrinsic, that inconvertible paper-money cannot possibly act as a medium of exchange and common *denominator*. The erroneousness of this view is well shown by Professor Walker (*Money*, ch. i. and xiii.). To avoid the suggestion of error, it might be better to speak with Senior of "intrinsic causes of value" (*Pol. Econ.*, p. 16); and to follow those who assert that "nothing can have an intrinsic value" (BARBON); "it is a contradiction in terms" (Macleod, *Credit*, ch. ii. §§ 17-18).

But when we use the term in this sense—or want of sense—we incur the danger which often attends correction of popular phraseology; namely, that some important property may be lost sight of. If, with Jevons, we regard value as a mere ratio of exchange (*Theory*, ch. iv.), let us take care, with Jevons, to remember that "there is a close connection" between value in this sense, and "esteem" or "final degree of utility" (*loc. cit.*). The relation between value in exchange and the other attribute of "intrinsic value," viz. cost of production, is not less likely to be lost sight of. The author of *A Critical Dissertation on Value*, S. BAILEY, may be instanced as one who incurred these dangers when he maintained that value is nothing positive or intrinsic, but merely a relation in which two commodities stand to each other. Locke uses the phrase in a sense which may be gathered from the subjoined passages:—"The raising of one species of your coin beyond its intrinsic value is done by coining any one species with less silver in it than is required by that value it bears in your money." "Silver which makes the intrinsic value of money." (See Locke's *Considerations of the Lowering of Interest.*) F. Y. E.

INVECTA ET ILLATA. The right of hypothec, which came to be of general application in Roman law, was first established by the prætor in case of a tenant-farmer agreeing with his landlord that the farming stock brought into his holding (*invecta et illata*) should become security for his rent. According to Roman law, movable property of a tenant put into a town-house warehouse, and (*invecta et illata*) under a contract of letting and hiring, was hypothecated to the landlord by operation of law without any agreement to that effect. E. A. W.

INVENTORY DUTIES. See DEATH DUTIES.

INVESTMENT. The investment of money by an individual means either some form of lending the money at interest, or its exchange for property from which a profit, rent, or income of any kind is expected, whether this property is already in existence or is being produced by those to whom the money is paid. The money invested may be either on the one hand the proceeds of the repayment of a loan, or of a sale of property, or on the other hand an amount saved from income. In the first case the investment, or more properly the reinvestment of the money, is simply the completion of an exchange of one sort of property for another: when, for example, a man sells a house and buys with the proceeds a share of a ship, he has merely exchanged the house for the share of the ship. The amount of money which can be invested or reinvested in this way is only limited by the extent to which exchanges of property take place; the more property is bought and sold the more money there will be to invest or reinvest. But the amount of money which can be invested from savings is a strictly limited quantity. It obviously cannot exceed the amount saved, and it must also, unless useless hoards are accumulated, always come up to that amount. There is an impression that savings may lie in a country "idle" or uninvested, but in a country like England this is never the case. If it be inquired where the accumulation of idle savings or uninvested money is to be found, the invariable answer is "In the banks." But if the balance-sheets of the banks be examined it will be seen that, after accounting for the amounts in transit between one bank and another, almost the whole of the "money" in their possession has already either been lent at interest, or spent in the purchase of securities. The term "money" in this case is merely applied to a figure representing the number of pounds the banks' various investments are taken to be worth. Even the balance which a bank holds at the Bank of England, and which to the bank which keeps it there is really "idle money," may be and frequently is lent out again by the Bank of England itself. The comparatively small quantity of money remaining is as necessary and useful to the banks as the small quantity which an individual carries in his pocket is to him, and though apparently at rest has been well described as the most "hard-worked" money in the country.

The savings and the new investments of the world are in short identical. They are the additions made to the accumulated wealth of the world, the new railways, roads, houses, mills, canals, and such like things, and the improvements effected in the old ones. When it is said that £200,000,000 a year is saved by a community what is meant is that £200,000,000 worth of its annual produce is not consumed but is added to its accumulated wealth or capital.

Though the amount the community adds to its capital depends on the amount saved by

individuals, the individuals who save do not in all cases settle in what form the additions to the capital shall appear. When a man lends his savings without stipulating how they shall be employed, or lets them "lie" at a bank, he practically delegates the decision of this question to the borrower, or the banker. Similarly, when he buys already-existing property, he virtually delegates the decision to some one who, having sold existing property, invests the proceeds in new property. What the new capital of a community shall consist of thus comes to be settled to a great extent by a special class of financiers, promoters, and speculators.

E. C.

The investment of capital by an individual in an undertaking already existing is only a transfer of the command of currency from one person to another. It makes no diminution in the floating cash in the banks, but places the command of a portion of it in one hand instead of in another. Where banking is fully developed, it does not even momentarily diminish available currency. The transfer as a rule is carried out by cheque, and the only effect upon currency is in the extent to which bankers may think it desirable to increase their cash holdings in times of more active demand. In the case of the investment of floating capital in a new undertaking, as in the construction of works not immediately productive, there is a diminution of the immediate purchasing power of the community. It diminishes by so much the amount of consumable or exchangeable goods that can be produced. If the country be previously producing enough only for its own support, it must now import to supply some part of its requirements. If it had already imported, it must now import more. The immediate effect upon the money market is, that the exchanges become unfavourable, and bullion must be exported.

If investments be made in a foreign undertaking, whether a new one or one already in existence and under foreign ownership, the effect is the same. It diminishes the immediate power of taking goods from abroad, substituting therefor an increased power in the future. But the capital is, nevertheless, really locked up, and great danger may arise from this fact being disguised by credit issues. The financial crisis of 1846-47, and some others of equal importance, have been ascribed to the too rapid conversion of floating capital into fixed capital. It would give, perhaps, a more exact view of the condition of these times to describe them as resulting from the undue expansion of credit founded upon the fixed capital invested. R. W. B.

INVOICE. A statement giving particulars of goods forwarded by a trader to a customer, and of their cost, and of the charges concerning the same. Some foreign countries require invoices to be legalised by their consuls, or verified by declarations as to their accuracy. The omission of the prescribed formalities may cause the custom-house authorities at the port of destination to forbid the importation.

E. S.

INVREA, FABIO, a Piedmontese marquis. The book he wrote, though little known, deserves notice for the able development of the theory of wealth which it contains.

Discorsi sulla pubblica ricchezza, ossia sopra di quanto la costituisce, sulla di lei origine, aumento e ripartizione (Genova), 1846.—Referred to in the *Bibliografia dei Trattati e compendii d'Econ. politica scritti da italiani dal 1765 al 1891*, by Prof. Cossa. A. B.

I.O.U. An acknowledgment of indebtedness worded as follows: To A.B.—I.O.U. [I owe you] £10—signed C.D. If such a document contains a promise to pay, it should be stamped as a promissory note. E. S.

IRISH CURRENCY. This term at the beginning of the present century denoted a money of account different from that in use in England. It disappears with the act of 1825, which finally assimilated the currency of Ireland to that of Great Britain.

The English denominations of money came early into use in Ireland. The value and the rating of coins were both tampered with on occasion, alike by the sovereign, and, apparently, by the Irish parliament; and throughout the variations in the intrinsic value of the English coinage, the Irish coins appear to have remained always less valuable. The records of receipts of revenue between Henry VIII. and James I. give amounts both in English and Irish currency, the latter being accounted less valuable by one-third, so that the amounts of English are three-fourths of the amounts in Irish currency. In fact there existed exactly the state of things described in the article on COLONIES: DENOMINATIONAL CURRENCY IN.

By a proclamation of James II. when a fugitive in Ireland (25th March 1689), the guinea is rated at £1:4s. Irish, and the shilling at 13d. Irish. This seems to be the first establishment of the ratio afterwards more particularly associated with the term "Irish currency"; and it is therefore incorrect to date that ratio from W. WOOD's halfpence (1725), as Mr. Culley does in his evidence cited at foot.

This ratio, which subsisted through the 18th century, gave a difference of $8\frac{1}{3}$ per cent on amounts of English converted into Irish money. All transactions between the two kingdoms were adjusted on this basis, and this inconvenience tended to enhance the premium on bills of exchange which between 1812 and 1815 had risen to 10 per cent; so that £118:6:8 Irish money was required to pay a debt of £100 in England. After the union this became more and more intolerable; the first important measure in alleviation was that of 1817 which authorised the transfer of

government and certain other funds between the kingdoms at the so-called *par* of 8⅓ per cent. The anomaly was abolished by the act of 1825 (6 Geo. IV. c. 79), which assimilated the currency in all parts of the United Kingdom, and enacted that contracts entered into previous to the date of the act should be satisfied by a payment in English currency of $\frac{1}{1\frac{2}{3}}$ of the amount expressed to be owing in Irish currency. The copper tokens of Ireland were called in under the same act.

[*House of Commons Papers*, 1868-69, vol. xxxv. pt. 2, p. 379. Evidence of Mr. Culley before the Commission on International Coinage, 1867-68.—Kelly's *Cambist*, 1831, pp. 401-403.] C. A. H.

IRISH LAND LAWS. See LAND LEGISLATION, IRISH.

IRON AND STEEL AS MONEY. Little doubt exists as to the extensive use of iron as money in very ancient times (probably in the period from 1000 to 600 B.C.), though, on account of the rapidity with which that metal rusts, no specimens now exist, and their exact form is therefore uncertain. Probably, however, they resembled in shape the small ingots which are found in use at the present day in Central Africa.

Experiments were made at the Royal Mint, London, in the year 1884, with a view to discover what would be the rate of wear of steel coins. The average wear after 26 hours' friction was ·0032 grammes of soft steel and ·0029 grammes of hard steel coins. When soft and hard steel coins were subjected to friction together, the soft coins lost, after 52 hours' friction, ·0077 grammes, and the hard coins only ·0042 grammes. The amount of metal lost, even in the case of the hardened steel, approximates closely to the loss sustained by standard gold and silver coins, when subjected to the same process. F. E. A.

IRREGULARITY OF EMPLOYMENT is more a social than an economic question, and it is one which the earlier economists hardly noticed. It has of late years been thoroughly recognised as an evil requiring careful investigation. The board of trade is now carrying out inquiries which it is hoped will throw considerable light on this subject. The Americans have also been paying much attention to it, but without particular success. At present, therefore, no series of well-observed facts exists to support generalisations on the subject.

Inconstancy of employment, as Professor Marshall terms it, is one of the chief conditions which presents itself for consideration in connection with the mass of unemployed in all countries. It may in this connection be viewed either as a result or a cause. Some men are so inefficient, so lazy, or disinclined for regular work, that they prevent themselves from being regularly employed. And in dealing with questions of irregularity of employment, it is of primary necessity to decide whether the case in point is such a result or no. It is only when it is a cause of distress arising outside the worker himself that its consideration falls within the proper sphere of economics. Here it is closely connected with the problem of the "unemployed."

The causes of irregularity in employment are:

(1) Essential conditions of the occupation—the work of the painter and mason are liable to be interrupted in certain states of the weather—the effect of a season on the demand for certain goods. Thus furriers are much harder at work in the autumn; and it is in evidence before the labour commission (C. 6708, III. 1892, p. 44) that in the confectionery trade the girls are often out of work from December, when the Christmas demand is over, up till February.

(2) Accidental circumstances which indirectly produce irregularity:

(*a*) The use of machinery. Of itself the use of machinery might be quite regular in effect, but constant labour-saving improvements tend to displace labour. The tendency of employers to produce in excess of the current demand is not strictly attributable to machinery, as suggested in evidence before the Labour Commission (C. 7063, I. 1893).

(*b*) Fluctuation of trade, produced by causes perhaps too complicated to classify roughly, but arising from the competition: (*α*) of home manufacturers, (*β*) of foreign countries. Thus "foreign tariffs" were cited before the labour commission as a cause of irregularity in employment: and the fall in prices was suggested as having that effect in the course of the enquiries of the Gold and Silver Commission, and that on Depression in Trade (1886).

The above heads probably include all the causes at work, but the analysis is not perfect. "Influx into towns," by which is meant over-competition of hands for any given work, has been cited as another cause, but this really only describes one of the conditions arising in part out of irregular employment; though doubtless the condition reacts so as to make matters worse.

DOCK LABOUR (*q.v.*) presents probably the worst instance of irregular employment, certainly the most prominent at the present time. It is in evidence before the labour commission that the average number of months for which the labourers were at work was seven; the rest of the year they used to "hang about the gates and starve":—the evil is the irregularity of employment reducing the average wage to 10s. a week; some only get 5s.; some are out of work for months" (C. 6708, II. 1892, pp. 9 and 12). On the other hand one witness of great experience (Mr. Hill) contended that this state of things was the fault of the men. At the time of the late dock strike attention was directed to the importance of regulating the labour, and something has been done in this direction.

As above stated, the problem whether it is possible to counteract irregularity in employment has only recently come up for solution. Professor Marshall doubts if the evil which "rightly attracts public attention" is greater than it was in past ages.

The palliatives or remedies hitherto suggested are practically but three, which require consideration in detail.

(i) It is contended that the remuneration or wages of an irregular employment tend to be proportionately higher than those which are more regular. Professor Marshall lays this down, (*Econ. of Ind.*, 1881, vol. i. p. 537), and instances the medical man.

(ii) The eight hours day is relied on by several witnesses before the labour commission for making employment more regular. No one, however, has explained how this effect will be manifested. It cannot of itself affect the irregularity arising out of the use of machinery or fluctuations of trade; and as it will tend to increase the productiveness of the labour employed, it will not immediately stop over-competition by opening avenues for the unemployed. Yet if it is allowed to come naturally, and as the result of experience, it will combine with other causes to operate in the direction of greater regularity.

(iii) Organisation of all labour as far as possible into permanent services with some security of tenure for the individual seems the most hopeful solution. The most prosperous employés as a body at the present day are those of the great railway companies, and next to them those of some large firms where a reciprocal feeling exists between masters and men, resulting in permanence of engagement accompanied by provisions for sickness and old age. The elimination of daily competition is the first step to the better regulation of labour. At the same time there should be ample power to dismiss bad and incompetent men. This has always been the difficulty in the organised system, and is precisely the point where the trades-union system is apt to break down.

Finally, it has been suggested as an advantage in irregular forms of employment, that there are periods of leisure. But when these are prolonged, there is a danger of anxiety as to the future which more than compensates for enforced idleness. Leisure to be valuable should be accompanied by regular employment.

C. A. H.

IRRITANCY (Scots law). Forfeiture of lease or of tenancy in FEU through some neglect or contravention. This may arise by force of law, or under the terms of the contract. Irritancies arising by force of law—such as loss of a feu through non-payment of the feu-duty for two years—are purgeable at any time before judgment by payment or restitution or fulfilment of the condition. An irritancy arising from agreement can, in general, not be so purged.

[Rankine, *On Leases*, 461.] A. D.

ISELIN, ISAAK (1728-1782), a Swiss physiocrat. He belonged to an old business family of Bâle, and passed the greater part of his life in his native city, where, after vain attempts to obtain a professorship at the university, he was elected, in 1756, secretary to the council (secretary of state). In this position he displayed great literary capacity, occupying himself at first with philosophical and historical subjects, but labouring entirely during the last ten years of his life (1772-1782), under the banners of the physiocrats. To the older pre-physiocratic period belong his works: *Patriotische und Philosophische Träume eines Menschenfreundes* (Patriotic and Philosophic Dreams of a Philanthropist), 1755, and *Geschichte der Menschheit* (History of Mankind), 1762. Both compositions show little originality. The second named exhibits a rather arbitrary reading of history, somewhat in the sense of the later *Esquisse* of CONDORCET. The change to the doctrines of the physiocrats is first obvious in the *Versuch über die gesellige Ordnung* (Essay on Social Order), 1772, where it is said in the preface that an "able man" (was it Schlettwein?) had some time before directed him to the study of the French economists. But the instruction seemed obscure to him, and "the fervour with which some defenders of these truths extolled the discoveries of their teachers seemed to me to be charlatanry rather than that honourable zeal for the truth which animates noble minds." Afterwards, by good fortune, the EPHÉMÉRIDES DU CITOYEN (*q.v.*) came into his hands, after reading which, QUESNAY became in his eyes "what NEWTON is in the eyes of a mathematician." The new standpoint comes to light, fully matured, in the work which appeared four years later:—*Träume eines Menschenfreundes.* (Dreams of a Philanthropist), 1776. This book is by no means a second edition of the work published in 1755, as is generally supposed, and as might have been conjectured from the kindred title, but quite a new work. He expresses himself thus on the subject, in the preface: "What I put into print twenty years ago under the title of *Patriotische und Philosophische Träume eines Menschenfreundes*—(Patriotic and Philosophic Dreams of a Philanthropist), and what I now publish entitled *Träume eines Menschenfreundes* (Dreams of a Philanthropist), although they agree in design, are nevertheless two quite different things. Those were merely sentiments of a young man, to give a new edition of which would be quite needless, and which may fairly be allowed to sink into oblivion." Iselin

thus publicly retracted his old ideas in favour of the authors who had adopted Quesnay's teaching, as the Marquis of Mirabeau, Baudeau, Comte d'Albon, and others. Commencing from the same year, 1776, Iselin published a monthly journal in German, dedicated to the propaganda of the doctrines of the economists; this bore the title, borrowed from the French organ of the school, *Ephemeriden der Menschheit* (Ephémérides of Mankind, or Library of Moral Philosophy and Politics). This soon gained a great reputation in German-speaking countries, and numbered among its contributors many of the most prominent economic authors of Germany. After the death of Iselin, which took place in 1782, it was carried on under the editorship of G. W. Becker, professor at the "Adeligen Gymnasium" in Dresden. For the rest, Iselin did not in all points agree with the "eminent Quesnay." He would have allowed the IMPÔT UNIQUE to be assessed progressively instead of proportionately; and if indeed he occasionally says with Mirabeau that the best corn law is *none*, yet elsewhere again he defends the public granaries condemned by Quesnay. How unhistorically, besides, Iselin reasoned, regardless of his former historical studies, is shown in the passages in his *Träume* (Dreams) where he maintains that only "chance and caprice have produced the difference between one people and another people," and when he then concludes that "everywhere likewise the laws must be the same, what is just in China must necessarily also be so at San Marino." Human institutions have corrupted the natural order, and Iselin concludes his *Träume* (Dreams) with an ideal constitution, by means of which "instructive fiction" he tries to reconcile the republicanism of his Swiss fatherland with the enlightened despotism recommended by Quesnay. Finally, Iselin proves himself to be a true son of his generation, anticipating the complete salvation of mankind in the *education* of the people. This caused Basedow, the German apostle of education, to appear to him, with Quesnay, the person most worthy of emulation.

[A. v. Miaskowski, *Isaak Iselin*, Basle, 1875.—W. Roscher, *Geschichte der National-ökonomik in Deutschland*, 1874.] A. O.

ISNARD, ACHILLE NICOLAS, born in Paris, died in 1802 or 1803. He published, anonymously, in 1781, a *Traité des Richesses* (London and Lausanne, 2 vols., 8vo), and in 1801 his *Considérations théoriques sur les Caisses d'amortissement de la Dette Publique* (Paris, 1801). The former is directed against the theory of the *produit net* and of the single tax of Quesnay; Isnard does not mention Adam Smith, although generally concurring with the latter's views on the origin of wealth, the effects of protection, and of the accumulation of gold and silver, etc.

Isnard, who was an engineer, has frequently recourse to mathematical symbols, although he does not venture farther than equations of the first degree and simple problems in the rule of three. As having done this, he is mentioned by Jevons in his *Theory of Political Economy*, 2nd ed. 1879, appendix i. p. 301. E. Ca.

ISOLA, FRANCESCO (first half of 19th century), Italian economist, is mentioned by A. Graziani in his *Idee economiche degli scrittori Emiliani e Romagnoli sino al 1848*, etc., Modena 1893, pp. 156-7. He was appointed, by the papal government, a member of the committee for the reform of the commercial code, and found in the materials thus provided the basis of his treatise on political economy. Isola was a protectionist, for though nominally a supporter of free-trade, he admits many exceptions to this principle. He proposes to prohibit the import of such articles as would injure the sale of similar home products; and also to limit the goods imported, fearing a general excess of production. He also discusses general values, considering that these originate in the demands of consumers, and in the scarcity of the goods themselves. He considers that with respect to money it is its intrinsic value as a commodity which, together with rapidity of circulation, forms the total purchasing power of the circulating medium, and determines the quantity of goods a market may require. He wrote also on interest and taxation, recommending that this should fall on superfluous wealth, and recommending indirect taxation.

Istituzioni di Commercio e di Economia civile, Roma, 1811. A. B.

ITALIAN SCHOOL OF ECONOMISTS.

Introduction, p. 460; The Early Phase, p. 461; Superficial and Optimistic Phase, p. 465; Scientific Phase, p. 466.

No one now, we imagine, would agree with Augustin Thierry, in characterising political economy as "cette science bourgeoise surgie dans les villes d'Italie," nor would conscientious scholarship ever entitle Italy to take the earliest place chronologically in economic research. Nevertheless it is beyond question that the early development of commercial wealth in mediæval Italy, the vigorous industries and economic inter-relations of her republican cities, attracted Italian thinkers early to the study of political economy. Italy can boast of a prominent position in the history of the science from the remotest times.

Italian economic thought, when traced from its first sources down to the present day, shows in its evolution, though chequered by many irregularities, three well-marked stages, corresponding to certain analogous conditions of the social evolution of the country. There is at first a roughly-developed, almost archaic phase of economic inquiry, the product of *patriarchal* economic relations; to this succeeds the *super-*

ficial and optimistic phase of the science, the product of the *small industry* system, when wealth was still scanty and distributed fairly equally; finally there is the *scientific* phase, developing with the expansion of capital. The first phase extends from the middle of the 13th to the end of the 18th century; the second carries us on to 1870; the third, initiated about 1870, is developing beneath our eyes, and may not yet have attained its maturity.

1. *The Early Phase.*—Economic thought in Italy seizes at the outset on the more obvious forms of social life, and advances gradually to investigation of the less obvious phenomena. Thus every phase of economic science is distinguished from its preceding phase by the deeper nature of its inquiries. The few early writers of Italy who touch on economic questions, put forward only external points, and, instead of analysing them closely, confine themselves to praise or criticism from a purely theological standpoint. The first advance in more thoroughgoing inquiry is found in the writings of political thinkers who are only concerned to trace the outlines of economic conditions in so far as these subserve their theories on legislation and administration. Hence when writers enter for the first time on the field of genuine economics, they turn to the most obvious and external economic subject, namely to currency; and a rich and varied literature rises and flourishes round that subject. Greater depth is attained in analysis of inland and foreign trade and its regulation. Thence the way is opened up to the investigation of value; the first treatises dealing with the more external manifestations, secondary forms, or market values, without bringing out the inner *nexus* connecting value with distribution of wealth. Not till the termination of the early phase do we come across some passing observations on the production and distribution of wealth; but these embody no definite doctrine.

One of the first Italians in the 13th century to reflect on economic facts was St. Thomas AQUINAS, who set himself to oppose usury,—both by authority of the Bible, popes, and councils, and on the principle that time belongs to God and may not be sold. He also wrote learned treatises on monetary and fiscal politics, with acute remarks on the nature of wealth. The theological standpoint is no less dominant in the 14th century, when both Paolino Minorita (1315) and Egidio Colonna (1247-1316) wrote. The former treats of the management of landed estates, of the family, and the citizen; the latter, of taxes. In the 15th century theological economics were developed in the writings of St. ANTONINUS, archbishop of Florence (1389-1455), and of St. Bernardino of Siena, who wrote in the first half of the 14th century. They reach the real gist of the theory of the circulation and distribution of wealth from the basis of theological morality, though they too have their say against usury. In the 15th, 16th, and 17th centuries the disquisitions of theologians become more interesting and practical, stimulated by the new phenomena of deposit and loan banks of the Monti di Pietà (see MONTS DE PIÉTÉ) and the public revenue derived therefrom. The banks, defended by some theologians, were assailed chiefly by the Augustinians. The Monti di Pietà were condemned by the Augustinian Nicolò Barianno and the Dominican Tommaso DE VIO, but defended by the Franciscan Da Busto and others. Even the mechanism of bills of exchange became at that epoch the subject of subtle polemics among theological writers, some of whom, like Fathers Bernardo GIUSTINIANI and Ortensio Capellone, attacked profit derived from exchange operations, while others, like Fathers Antonio di San Salvatore and Basilio Alemanni, defended it.

Meanwhile a more discriminating and scientific tendency began gradually to replace the older scholastic and religious views; attention was paid to reasons of state and the practice of good government. Some timid manifestations of this tendency had not indeed been wanting at remoter epochs. In the 14th century Petrarch, in his book *De republica optime administranda*, expatiated on justice and moderation in imposts and on the abuses of farmers of taxes. Andrea de Isernia too, the Neapolitan legist, expressed some remarkable opinions as to the extent to which domain land might be alienated, and on farming of taxes. In the following century this scientific tendency makes a greater advance through the writings of Giovanni Gioviano PONTANO, Benedetto Cotrugli, and especially Diomede CARAFA, who in his work *De regis et boni principis officio* gives expression to ideas, new in part, on the utility of commerce and on the harmony between incomes and public expenditure, on the convenience of farming taxes, and on the assessment of taxes. The 16th century can boast of still greater progress in the same direction made by men like Matteo PALMIERI, Francesco GUICCIARDINI, and Nicolò Machiavelli. The first occupied himself largely with political economy, advocating proportional taxation. The second frequently introduces economics into his historical writings, and with great skill traces the contrast between *proportional* and *graduated taxation*. The third insists on the economic necessity of good government, recommends that to ensure prosperity to industry the state should guarantee the security of property and grant bounties to the most skilled and capable producers; he also maintains, like MONTESQUIEU later, that countries are populous in virtue of the goodness and mildness of their respective governments; and, finally, anticipates MALTHUS in affirming that there is a limit to the powers of production of the soil which checks the indefinite increase of

the human race (see in particular bk. ii. of the *Storie Fiorentine*, chs. i. and ii.; also the discourses on the first *Decade* of Livy, bk. ii. chs. iii. and v.). Even with greater force than Machiavelli, Giovanni BOTERO had held this argument in his work *Ragione di Stato, con tre libri delle cause della grandezza e magnificenza delle città* (three books dealing with the causes of the greatness and magnificence of cities) (1589), in which he insists, from the political standpoint, on the necessity of providing an equilibrium between the increase of population and that of subsistence, and urges the foundation of colonies as a remedy for an excess of the former. Botero moreover has some remarkable observations, inspired it is true in part by BODIN, on government monopolies and on the restraints placed on commercial liberty.

The evidence of the advance amongst Italian thinkers in the direction of abandoning the general and abstract considerations so dear to the ancient writers for a thorough investigation of their social mechanism, is seen in the very numerous contemporary treatises on currency. The deplorable state of the Italian monetary system, the continual debasement of coin by different rulers, and the great variety of coins current in the different states of the peninsula, to the great detriment of trade, could not fail to engage the attention of economists, and it is no marvel if, as GANILH said, Italy was always famous for the worst currency and the best writings on currency. First of these in order of time is the *Discorso sopra le monete e della vera proporzione fra l'oro e l'argento*, 1582, by Gaspare SCARUFFI, who was first to propose the international unification of monetary systems and universal, or at least European, bimetallism with a ratio (corresponding to that in force in his day) of 1 to 12. After Scaruffi, DAVANZATI (1588) published two short treatises, remarkable for elegance of style, one on coinage, in which he maintains that the expenses of mintage should be borne by the state, the other on exchanges. Unlike other writers, *e.g.* BROGGIA, who exaggerated the importance of money as facilitating hoarding, Davanzati does not lose sight of money as an instrument of circulation, comparing it to the circulation of the blood, which, if congested at any point produces atrophy and dropsy, whence he concludes that an equal distribution of money should be brought about in all parts of Italy. Geminiano MONTANARI (1633-1687) opposes the sweating of the coinage by rulers, and lays down useful precepts on the methods of regulating judiciously the circulation, with suggestive remarks on money. Still more distinguished and less remote from the actual focus of the science are the works of GALIANI on currency (1750),—free from most of the prejudices of mercantilism,—of PAGNINI, *Sul giusto prezzo delle cose* (On the fair price of Commodities) 1751, which contains profound reflections on the different characteristics of the circulating medium in ancient and modern economy, and the excellent *Osservazioni sopra il prezzo legale delle monete* (Observations on the legal price of Money) by Pompeo NERI the Florentine (1751). But all these writers who investigate currency from the standpoint of the mint and the state rather than from that of the economist, are excelled by Antonio SERRA of Cosenza, who in his *Breve trattato delle cause che possono fare abbondare li regni d'oro e d'argento* (Short treatise on the causes which can lead to abundance of Gold and Silver) (1613), sets forth lucidly a theory of money in relation to international trade, admirably elucidating the mechanism of exchange and showing that a favourable exchange, believed by his contemporaries to be effected by sovereign decree, is the natural result of excess of exports over imports, and that therefore the only way for a nation to secure and maintain it is by promoting industry and encouraging enterprise, and not, as MUN said later, by imposing custom-duties on manufactured imports; especially, maintains Serra, by developing manufactures, inasmuch as these have an indefinite possibility of increase, while agricultural commodities follow the law of DIMINISHING RETURNS. A remarkable forecast this of the famous law expounded later in England by WEST, RICARDO, MALTHUS, and J. S. MILL. Not less praiseworthy is the vehemence with which Serra opposes the debasing and sweating of the coinage,—the very mode, on the other hand, occurring to M. Antonio DE SANCTIS as the best for remedying the fall in exchange and the crises in the kingdom of Naples.

To the list of writers on currency we may add the names of Domenico and Luigi DIODATI, of TURBOLI, and of Romeo BOCCHI (1621), who treated with ability of payments and compensations. There are other writings called forth by the establishment of banks at Venice and Genoa, but unimportant as regards theory.

The analysis of currency naturally led Italian economists on to study the kindred, perhaps deeper, subject of international trade. They discussed various systems referring to the economic conditions of the day. The difficulty of importing foreign corn through defective transport, together with the increase of population which began to press on demand, induced economists, *e.g.* SEGNI (1602), and TAPIA (1638), to favour the system of *annona* (stores), called the *Sistema Annonario*, or system of providing food, and of corn stores (GRENIERS D'ABONDANCE), intended to ensure the country abundance of food by stopping exports. These arrangements, which were urged on by the complaints of agriculture, stifled the improvements in transport, which would have rendered the importation of grain possible; meanwhile the increase in population made this necessary. The discussion thus aroused gave rise early to controversy, and led to the institution of the MERCANTILE SYSTEM, which, while allowing the free importation of raw produce, lays prohibitive duties on the import of manufactures, seeking to develop national manufactures while sanctioning the introduction of cheap foreign corn. Mercantilism in its primitive form was defended by BELLONI (1750), an author commended by Sir James STEUART—

Belloni recommended that export of money should be prohibited. This doctrine was fully expounded by Antonio Genovesi (1765), unquestionably the most illustrious of Italian mercantilists, who popularised the system among southern writers, whilst the negative side of mercantilism, free trade in corn, found a brilliant apostle in the Abbé Galiani (1770).

Mercantilism was bound to meet immediate opposition; the serious injuries which it inflicts on landowners—ever uneasy and influential—and the fiscal burdens which it inflicts on trade, could not fail to favour the growth of an opposite view, termed by Cossa *Agrarian protectionism*. This, inspired by the landed interest, desired to lay heavy duties on import of grain, and insisted on free export of manufactured goods. Its most noteworthy representatives are Pascoli (1733) and Bandini (1775). Economists everywhere in Italy have remained loyal to the doctrine of restriction of trade, more in the form of mercantilism than of agrarian protection, and this even when the theory of free trade had matured in France and England. Even the influence of theories of the physiocrats, so evident in Beccaria and Verri, did not remove this predilection. The solitary luminous exception in this as in other respects is afforded by Ortes, who, proceeding on different principles from those of the physiocrats, and, as we shall see, positively original, concludes in favour of absolute freedom of foreign trade.

Nevertheless many Italian economists of this first period were in favour of free inland trade, either combating the abuses of trading corporations—Genovesi, Verri (1771), and Beccaria (1769); or calling for their total suppression—Vasco (1794), Fabbroni (1778), and Gianni.

Much less valuable is Italian economic opinion on finance. There is throughout a predilection for taxes on land, due much less to the influence of the physiocrats than to the distinctly agricultural character of Italy in past centuries, and the almost entire absence of manufactures. To the taxes on land which Botero, Bandini, and Filangieri (1780) advocated as the only source of revenue, Genovesi proposed to add the poll-tax; Verri, duties on exports of raw produce, and imports of manufactured goods; Ammirato (1594) excise-duties; Broggia (1743), beside taxes on land and manufactured goods, advises a tax of the tenth of all capital producing interest, with moderate customs and an excise on provisions. But none of these writers has the remotest idea of the possibility of a tax on profits, which holds so large a place in the system of Ricardo,—a remarkable fact, as showing how slightly capital, and the returns from it, had as yet been developed. Filangieri's proposal for extraordinary revenue deserves to be commemorated. He recommended the institution of a fund for the use of the more deserving and enterprising citizens, who were to be bound to repay the advances which had been made them when called on to do so by the state. There are also interesting discussions by writers on finance on the exemption from taxation of the nobility and clergy, which the most eminent—such as Genovesi, Bandini, Fra Paolo Sarpi—vigorously condemned.

These empirical studies, which discussed only practical questions, were soon followed, partly owing to the foundation of chairs of political economy at Naples (1754), Palermo, Milan, and Modena, by deeper researches extending into theory, which began, though imperfectly, to take the form of a pure science. In this connection the discussions on the theory of value are important: these were principally connected by our best economists with analyses of the theory of "money," and are distinguished by acumen and insight. In the Italian view of the theory of value, two absolutely distinct phases appear; in the former, represented by Davanzati, Montanari, Pagnini, Genovesi, and Paoletti (1772), the element of "cost" is absolutely excluded, and "value" is represented as governed wholly by "utility"; in the latter, expounded by Galiani, Beccaria, Fabbroni, value on the contrary is based on "cost of production."[1] The cause of this development of theory was a corresponding advance in the economic mechanism of society in Italy. In the first period the non-existence of free competition between producers, or else the restrictions which limited it, rendered it impossible to determine "value" by the factor of "cost," and inevitable that it should be determined by the factor of "utility." In the second period, when competition between producers was unchecked, "value" naturally tended to become commensurate with "cost of production." Nevertheless, even at a more advanced stage of their inquiries, Italian economists of that epoch always confine themselves to the more superficial and unimportant aspects of the question of value, dwelling especially on market value, and are not able to analyse the elements of the cost of production, oscillating (like Vanderlint and Steuart) in perpetual ambiguity between labour and wages. This is not wonderful considering how childish were the ideas of the economists, even of the highest repute, respecting the production and distribution of wealth, which nevertheless are the data essential for resolving cost of production into its constituent elements. Only the very best Italian economists of the 18th century possessed any notion of the theory

[1] The position of Ortes is eclectic. Originally he deduces value from demand and supply, but afterwards he measures it by the quantity and quality of the labour employed in production and transport, and thereby explains the greater value of the commodities in the metropolis and the greater quantity of money which circulates there.

of capital, while their views on production were meagre and vague. The observations of Beccaria on division of labour are always quoted.

"Everybody proves by experience," he says, "that the constant application of hands and wits to the same kind of work and product renders the same easier, better, and more fruitful than would be the result did every one make by himself merely what is necessary to himself; whence it comes that some pasture cattle, some card wool, others spin it, some grow corn, others make bread, raiment, tools for the agriculturists and labourers, causing growth and concatenation of arts and a division of them so as to serve common and private utility among all classes and conditions." (*Elem. di Ec. Pubblica*, pt. i. ch. i.).

Here we get, it is true, the social division of labour, but nothing about its technical division, or specialisation within the same industry, an exact idea of which Adam Smith was to set forth in so masterly a manner seven years later. Yet these observations by Beccaria, and those of Verri, that in production man does not create, but confines his operations to collecting and separating material already existing, with some considerations by the same author on the influence of climate on efficiency of labour, are all that is worth gleaning from the works of the earlier Italian economists on the subject of production.

Nor do their writings on the distribution of wealth take any higher rank; inasmuch as they have not attained to an exact definition of income, wages, profits, and rent of land. Botero's view, that population is limited by subsistence, is restated by Beccaria, and more clearly still by Ricci (1787), but these writers treat the subject only in a superficial manner, and not in such a way as to entitle them, as some would have it, to be regarded as precursors of MALTHUS. Of more frequent occurrence in the writings of the economists of this epoch, *e.g.* CARACCIOLI (1784), PAOLETTI, Beccaria, whose remarks on wages are termed "classic" by the Russian writer Wernardski, is the assertion that high prices of provisions, and the rise in money wages which ensues, are injurious to industry,—an assertion which, put forward contemporaneously in England by a series of economists, and repeated by Smith, is the logical consequence of the theory which reckons wages among the elements of the cost and of the value of the product. One marked characteristic of the Italian economists of this period is the absolute eclecticism with which they perpetually oscillate between the mercantilists and the physiocrats, and strive to reconcile the deductions from both. Besides this it is well to note the lofty and humane principles inspiring their remarks on economic relations, contrasting favourably with those of their French and English contemporaries,— their sympathetic interest in the fate of the producer—which they consider more important than the exigencies of production—their courageous denunciation of the wretchedness of the peasants, their thoroughgoing predilection for small farming, and finally their eloquent pleading that the legislator should intervene to mitigate economic inequality and injustice,—in these matters they sound the prelude to what is now known as socialism of the chair (see SOCIALISTS OF THE CHAIR). This tone is common to all the economists of the peninsula, and not, as some hold, peculiar to central and northern Italy, since it is equally shown in the works of the southern Genovesi, Galiani, Filangieri, and Broggia, and in those of the northern Beccaria, Vasco, and Verri, and again among the Tuscans, Bandini, and Paoletti. All our economists of whatever school concern themselves not only, like Adam Smith, with the *wealth of nations*, but also, and as much, with the *public weal*, for which the very titles of their works are the proof, namely those of Vasco, Paoletti, Palmieri, MURATORI, etc.—a significant difference, attesting the ethical and philanthropic character of economic science in Italy. This character is possibly due in part to the fact that some of our economists, like Ortes, Paoletti, Bandini, Galiani, Ammirato, Vasco, Genovesi, and Pascoli, have been ecclesiastics; others, like Beccaria, Verri, Scaruffi, D'Arco, Carraccioli, are nobles; while few only, like Davanzati, Broggia, Belloni, have been merchants or bankers. Nevertheless the generous and noble expressions to which we have referred, and which deservedly attract so much sympathy to our economists of this epoch, do not rise from the narrow limits of sentimental literature nor do they show any profound reflection on the laws of economics.

One amongst them, however, does not deserve this criticism, and rises far above his contemporaries. This is the Venetian monk Giammaria Ortes, one of the greatest economists of the 18th century.[1]

[1] *The opinions of G. Ortes.*—G. Ortes was unquestionably the most original thinker among all Italian economists. In his *Economia Nazionale* (1774), his *Riflessioni sulla Popolazione* (1790), and in some of his minor writings, he develops a complete system of economic science. The fundamental notion from which he starts is, that a given population cannot consume, and therefore cannot produce, more than a limited quantity of goods, and that this quantity is just such as to require for its production not more than the labour of one-half of the given population. Hence he deduces the opinion that a man cannot increase his own wealth without reducing to a corresponding extent the wealth of another man; in other words, that the increase of individual wealth involves a correlative increase of misery. From the principle that one-half the population suffices for social production, Ortes, anticipating modern socialism, deduces the hopeless case of a relatively excessive population, due not to a positive excess of population above the means of subsistence, but to the impossibility of increasing consumption, and *therefore* social production, beyond a certain point. In this deduction Ortes manifests a logical acumen far superior to that of SISMONDI. The latter, whose influence on MALTHUS and RICARDO was considerable, also starting from the limitation of social consumption, admits the necessity of the introduction of machinery to meet the relative excess of population.

The last remark of our note on the opinions of Ortes, indeed, applies more or less to all Italian political economy of the early period. The leading features of the social economy which succeeded the abolition of serfage in Italy were for a long period the breaking up of capital, the growth of metayage, the continuance of small industry,—in other words they presented a stunted form of capitalism crossed and complicated by numerous relations of personal service between labourer and proprietor, the relics of feudalism. This network of economic relations created a scientific literature in which it was reflected. No sound theory of distribution could be formulated in a country where the phenomena of distribution had not assumed a distinct and fixed character, nor had those glaring contrasts to which a social economy gives rise, in which capital is more fully developed, had a fair field to display themselves. Hence, all that Italian economists of past centuries have written on distribution is collectively of very small value. But while they were excluded, through the defects in the existing economic position, from the possibility of investigating the deep-lying social relations, they set themselves eagerly to examine those more patent economic relations the growth of which, being independent of that of more fundamental relations, had opportunity to display itself even in Italy. Hence, the considerable body of writings on currency, which are the best part of Italian economic literature, as well as on commerce, usury, and taxation; while the investigations on value, which occur frequently at this epoch, are confined to analyses, more or less effective, of wants, utility, competition, or monopoly, but which do not in the least account for the influences determining the part played by value in the deepest relations of capital and profit and in the technical organism of production. Certain it is that the closer we approach our own times, the more frequently do we find among Italian economists good examples of a profound analysis of the economic structure of society, as in the works of ORTES, GALIANI, BECCARIA, VERRI, GENOVESI, and PAGNINI (*q.v.*). But, generally, throughout this epoch, and even among these, we look in vain for that fine economic sense which distinguishes their English contemporaries so conspicuously.

2. *Superficial and optimistic phase.*—With the close of the 18th century, capital had begun to develop its influences in Italy to a degree hitherto unknown. It seemed therefore that the causes of the slow advances of economic theory were ceasing to operate, and that the era of scientific economics in Italy was to begin. But there were weighty reasons which influenced capitalistic economy and kept it backward. The most powerful of those was the want of political union; this involved a close network of inland custom-duties, which stifled economic progress and the growth of capital. Hence, the absence of farming and industry on any large scale and the scanty use of machinery. This absence of production on a large scale is certain to react on theory and to produce a school of superficial and optimistic political economy. The inferiority of the work of most of the writers of this epoch is, therefore, not surprising, nor that the few original thinkers should gradually drift from tedious superficiality to optimistic doctrines. During this epoch no important contributions were made to the theory of the distribution of wealth, or to the analysis of property, while there is no lack of suggestive investigation into such secondary matters as currency, trade, and taxation.

The period 1800-1848, is for Italian economics an inglorious time of depression and

Ortes, however, in his *Riflessioni sulla Popolazione*, published fourteen years after his principal work, admits, in partial divergence from what he had there laid down, that a population might possibly outrun its means of subsistence—an emergency which is in contradiction to the axiom, that *wealth is a constant function of population*, since it implies that, up to a certain point, wealth increases at a lower ratio than population. Finally, from the fact that the unemployed can only live at the expense of the employers (*i.e.* those who have property), Ortes deduces the principle that *real income is equal to each*, because those who have property have to distribute all the returns which are in excess of what they consume beween the workers and the unemployed.

These quaint doctrines, which MARX very ably made use of to support his own, betray constantly the backward state of the science, exaggerating the importance of consumption and attributing to this factor, which only influences the surface of things, phenomena which have their roots deep down in the organism of production. Still more defective are the investigations of Ortes on capital and profit. Defining capital as the sum of the means of subsistence necessary to the worker, he does not take into account capital sunk in machinery, raw material, etc. While he recognises the economic justice of interest on capital, he declares it to be a thing which, properly considered, is entirely anomalous, for the reason, that capital lent at interest yields a return to the lender and a wage for the workers, but nothing to the borrowing ENTREPRENEUR, who hence will have either to go to the wall or to steal from his creditor. This observation is obviously erroneous, because capital does produce, besides interest and wages, the reward of the *entrepreneur*. But these doctrines appear less strange when viewed in relation to the economic conditions of the time. The principle of fixity in production is a faithful image of the economic positions of the expiring Venetian republic, in which there was no progress in production, and every industry was languid. The hopeless case of an unemployed class was true enough of a country in which the accumulation of capital was feeble, and shackled by the countless fetters of antiquated methods of production. The definition of capital given by Ortes fits an epoch when capital in its technical shape is almost non-existent. And the same idea of real income being equal for every man may be considered a tolerably correct expression of the relations of feudal economy, which, in placing the strength of the property-holder in the number of his followers, broke up his returns between a large number of clients, and ultimately reduced to the same figure the consumption of himself and of his dependants. The disconsolate fatalism of Ortes which sees no remedy whatever for the economic evils of the day, and the only palliative in the endowment of monasteries to relieve the wretchedness of the poor—which restricted thus the scope of economics to the mitigation of human misery,—all this distinctly and completely reflects the state of decay under which Italy was groaning. Hence in reading at this day the works of Ortes there is still profit, not in the nebulous musings of a recluse, but in the theorising of a genius over an age now buried. [See also art. on ORTES.]

decadence, yet it was distinguished by the monumental collection of classical Italian economists, formed by Baron CUSTODI, *Scrittori Classici Italiani di Economia Politica*, forty-three volumes, 8vo, Milan, 1802-16. The importation of Smith's doctrines, instead of acting as a stimulus to reflection, only evoked a number of second-rate compilations. There are but one or two writers of this period who stand out from the general level of inferiority by their able investigations into some special problems. Amongst these is Melchiore GIOJA (1767-1829), the advocate of large landed estates and industrial protection, remarkable rather for some important observations on the division of labour, which were praised by BABBAGE, than for his indefatigable collecting of statistics, and his infelicitous attacks upon Smith and SAY. There was also Gian-Domenico ROMAGNOSI (1761-1825), a masterly critic of free trade, who showed his concurrence with the ethical view now upheld in Germany, and who combated the population theories of MALTHUS though not without committing serious blunders; Luigi Molinari VALERIANI (1758-1828), author of deep, careful investigations into "market value"; Francesco FUOCO (died 1841), who expounded the Ricardian theory of rent, and is noted for the pre-eminence he assigns to the distribution of wealth over its production; Carlo CATTANEO (1801-1869), a defender of free trade and a critic of the system of LIST (1789-1846); Pellegrino ROSSI (1787-1848), who lectured on political economy, expounding English economics, and criticised the Code Napoléon from the economic standpoint; Antonio SCIALOJA (1817-1877), who published *Principles of Social Economy*, toning down the theories of the English school; finally Camillo CAVOUR (1810-1861), distinguished for his admirable writings on the corn trade, the Irish question, and his speeches on economic and financial subjects. All these writers inherited an ethical standard in economics which up to 1848 characterised the Italian school of economists; and all, however they may differ in the systems they uphold, hold most pronounced opinions on the moral functions of the state and its social duties towards the classes who possess no property.

Towards 1850 a distinct awakening succeeds to these indecisive writings of unsystematic writers, proceeding from the optimistic school and its head, Francesco Ferrara.[1]

3. *Scientific Phase.*—The conditions of the time favoured the abandonment of optimistic doctrines for objective and positive inquiry. Under the regime of political unity the obstacles

[1] F. Ferrara, born 1810, of Sicilian origin, professor at the university of Turin, and subsequently deputy and minister of finance, is unquestionably the most talented Italian economist of this period. Ferrara has written no comprehensive work, but has expounded his ideas not only in a course of able lectures, but also in a series of *Introductions* to the numerous volumes of the *Biblioteca dell' Economista* which he edited, and which contain translations of leading foreign economic works. In these introductions, which combine the attractions of a brilliant style, a method of teaching of vast range and marvellously elaborated, there is found not only a series of criticisms, biographies, and bibliographies, but also Ferrara's own theories, forming a symmetric and usually concordant whole. These take their rise from the theory of value, which he declares to be the mother-idea of the science, and develops with much originality save where he adheres closely to the doctrines of CAREY. Like him, Ferrara opposes RICARDO's theory of value and that of J. B. SAY, to land himself in the formula of *cost of reproduction*. This theory, which he carefully develops, seems to Ferrara to be alone capable of summing up and unifying all economic phenomena, inasmuch as it explains value as well in the case of production which may be indefinitely increased as in the case in which increase takes place under augmented difficulty, and also in monopolies. However, to include these last within the circle of his theory, he is compelled to have recourse to a subtle distinction between *physical* and *economic* reproduction, and maintains that the value of the monopolised products is given by the cost, not of the physical reproduction, which is impossible, but of the *economic* reproduction, *i.e.* by the cost of the products which would be obtained instead of the monopolised products.

In this way Ferrara believed he had subsumed the true heads of value under a single law, overcoming the Ricardian theory which is forced to postulate two laws for competition and monopoly respectively. But further, he held that cost of reproduction ought to explain and measure by the same standard all the relations of the distribution of wealth. Hence, Ferrara argues, rent, profit, wages, are only so many instances of the law of cost of reproduction. To rent in particular, on which English science has left the indelible stamp of its strong hand, Ferrara devotes his best energies; strengthening himself by his theory of value, he attacks the doctrine of Ricardo and reconstructs the rent of the landowner as the natural and legitimate reward of capital and labour. Here, however, Carey inspires and directs Ferrara, who, if he does not distinctly grant that cultivation proceeds from sterile to fertile soils, admits that economic progress renders the cultivation of fresh soil more productive than those previously taken in hand, thus ensuring an advantage to the land latest brought into cultivation over the first. The owners of the later land cultivated derive in consequence a surplus rent, or surplus over ordinary profit, due to the superior methods they have designed and carried out. Hence rent results, not from increasing cost of production, but from decreasing cost of reproduction, and involves neither usurpation nor injustice. Further, since the same theory is to explain all economic phenomena, profit is measured by the cost of reproduction of capital, wages by the cost of reproduction of labour; which means that ultimately demand and supply of capital produce profit, demand and supply of labour produce wages.

In his minor works, the *Prefazioni* and the *Lezioni*, Ferrara sought to apply his favourite theory to certain practical questions, using pure science to throw light on the economic facts of which he was an eye-witness. Among these writings are the exhaustive articles on "Banks" and on "Inconvertible Paper Currency" (Corso Forzoso), abounding in admirable remarks on the circulating medium in Italy (see ASSIGNAT; BULLION COMMITTEE, REPORT OF; FORCED CURRENCY; INCONVERTIBLE CURRENCY); others on the banks of Venice and on taxation of flour, which Ferrara defends with partial inconsistency in view of his free-trade theories. It is not wonderful that so extraordinary and gifted a writer should have created a flourishing school attracting into his orbit the best intellects of the peninsula. Minghetti, in a well-known work remarkable for brilliancy of style (*Della economia pubblica e delle sue attinenze colla morale e col diritto*, 1858), accepted and supplemented Ferrara's theory; Reymond in his *Études sur l'Economie sociale et internationale* (1860-61), further confirmed it; Antonio Ciccone, Angelo MARESCOTTI, Giovanni Bruno, Todde, and others commented on it in their treatises. During a long period, Ferrara occupied a solitary and preponderating position in Italian economic literature, due rather to his marvellous ability than to the soundness of his doctrines. Italian intelligence has extricated itself from the spell of the illustrious theoriser; his system has gradually been abandoned.

to the establishment of a social economy based on capital became slowly removed. The distressing phenomena of a critical period of social evolution in Italy were attracting investigation. Statistical research, directed by the hand of Bodio, revealed the vitiated character of the system by which wealth was distributed, the encroachments of the *latifundia*, the spread of short leases; and important publications showed that the actual state of the rural classes was as degraded as it well could be. Sonnino, Villari, Franchetti, Mme. White Mario, Lombroso, Stivanello, Mortara,—all these illustrated the condition of the agricultural classes in a series of memorable monographs, while the exhaustive work of the agrarian commission contributed ample materials invested with official authority. In those reports Emilio MORPURGO drew in the dark hues of truth the deplorable wretchedness of the agricultural classes in Venetia. And the reports of JACINI, Angeloni, Branca, Tanari, and Damiani showed that Italy had reached her lowest level of misery, inasmuch as from provinces mutually dissimilar there was heard but one wail and the selfsame moan.

A new habit of research and criticism informed economic thought from end to end of the peninsula, and a legion of clever and ardent youths flung themselves into the open field of social inquiry. Theirs is the merit that Italy occupies a position in the political economy of to-day on a level with more advanced countries; theirs is the merit that she has entered on the scientific phase.

Even in the preceding generation Italian writers were not wanting who set themselves to study economic relations with impartial criticism *e.g.* Girolamo Boccardo, who in his *Trattato teorico-pratico di Economia Politica* (1853), still the delight of the Italian student—defended and repolished the exact theories of Ricardo. It was, however, especially in the field of technical and specific inquiry that scientific economics was to prevail. Among the first indications of this tendency was the book by Baer, *L'avere et l'imposta* (1872), praised by J. Stuart Mill,—the *Logica delle Imposte* (1867), written by Pescatore, a calm and impartial study of public finance; and Jacini's work, *La Proprietà fondiaria e le Popolazioni agricole in Lombardia* (1854), a good example of positive analysis.

But the real initiator of the scientific method is undoubtedly Angelo Messedaglia. A distinguished physicist and mathematician, Messedaglia appeared least of any one inclined to examine the burning questions of economics, his turn of mind inclining him rather to more special and calm studies. Therefore he launched into a series of investigations into population, public loans, currency, taxes on real property, in which he sought to secure not the triumph of a school, but to lay bare and differentiate the most intimate connections of economic phenomena in a number of monographs written with conscientious and exact precision.

In his book *Della Teoria della Popolazione, principalmente sotto l'Aspetto del Metodo* (1858), unfortunately unfinished, Messedaglia puts forward an emendation of the Malthusian theory, namely, that the two progressions of subsistence and population cannot proceed as mutually isolated and independent. The latter is strictly limited by the former, which gives a different result from that reached by Malthus. For, given the former rate, two, three, four, five . . . and the latter, two, four, eight . . . it is evident that in the latter the second term will be suddenly reduced to three by the limit of subsistence killing off the surplus. Hence the successive doubling of population can only start from three, raising numbers in the third turn no higher than six. This again, colliding with a sum of subsistence equal to four, becomes reduced to four, and this by the given rate gives eight. Hence the real progression for population is two, four, six, eight, ten . . . *i.e.* an arithmetical progression with a constant difference double that of the rate of subsistence. Equally important are Messedaglia's further developments of the population theory, the statistics moreover of which, and the methods of handling them, he has expounded and criticised with great acumen in a solid work on the *Vita Media* (average of life). In his book on public loans, Messedaglia discusses the different questions connected with raising public loans, and in his recent work on currency, the history of money and prices, and the controversy on the legal standard. Finally his report *Sulla Perequazione Fondiaria* (1884) gives a history of the Cadastre (see CADASTRAL SURVEY) from the earliest times, and of the character of the surveys of land, and the taxes based on them in widely-separated and contrasted countries and states. The works of Messedaglia are in some points open to criticism, especially for their eclecticism and the indefiniteness of his results, but his labours will leave an enduring mark on Italian economic thought.

Messedaglia's strictly scientific method, which he employed on technical subjects extraneous to social controversies, has been applied by other and well-known economists to the most burning questions concerning the distribution of wealth. Among these Emilio Nazzani should be mentioned, who, while the prevailing school was yet seeking to draw a veil over the more painful phenomena of our economic system, courageously examined the laws of rent (1872), profit (1877), and wages (1880), developing and amplifying the theories of Ricardo. The writings of Nazzani mark a new starting-point in Italian political economy, leading it to reject optimistic fallacies and to initiate a vigorous criticism of the relations of production. However, neither he nor the other Italian economists of the same school have adopted the extreme conclusions of their doctrines, but have laboured rather to

qualify them by every possible means. Thus Nazzani seeks to soften the asperities of the Ricardian theory of rent, and the teaching of the English school; nevertheless he has laid the foundations of solid inquiry into the laws of distribution.

Again Fedele Lampertico influenced the economic revival in Italy by reproducing English and German theories in a lengthy treatise (1874, etc.); while Luigi Luzzatti, eloquent opponent of the exaggerations of *laissez faire*, has ably dealt with treaties of commerce, tariffs, currency, and credit, both in his writings and parliamentary life.

But the chief honour of the peaceful revolution whence scientific economics in Italy have sprung belongs unquestionably to Luigi Cossa; he has not only contributed a noteworthy and original essay on the limits of production, and diffused and championed in Italy the theories of the English school, harmonising them with those of Germany (which have also been popularised in Italy by Cusumano), France, and Holland, in which he is extremely well read; but he has also by teaching, by prizes, and instructive writings stimulated the economic studies of young Italy, creating around him a compact phalanx of able and diligent disciples.

A testimony to the awakening power of such masters may be seen in the numerous publications of youthful Italian economists, all educated in the new and progressive tendencies and agreed in the search for truth, however else they may differ. Of those cultivating exact science are Buzzetti, who has dealt with internal values and agricultural contracts,—Ricca-Salerno, who has dealt with capital, public loans, and wages,—Graziani, with machinery and wages,—Alessio, Bertini, Valenti, and Tangorra, with the theory of value,—Manara and Masè-Dari, who have examined rent,—Supino, capital and its transformations,—Majorana, economic laws,—and many others besides. While these economists are mainly deductive in treatment, others complement abstract research by a judicious application of the historic method. Among these, Cognetti de Martiis has written on primitive forms of economic evolution and the origin of socialism, —Toniolo on the factors of the economic power of medieval Florence, and the relation of scholasticism to humanism. Other writers apply sociology to political economy, like Vanni, an eminent philosopher, and Nitti, author of the book on *Catholic Socialism*, in their works on population. Ugo Rabbeno, who follows the inductive method, has treated of co-operation, its laws, and development in Italy and England, with great talent, and also has written a work on the phases of American protectionism. Equally skilled in statistical method, and more decided partisans of the socialism of the chair, are Carlo F. Ferraris, author of a book on labour insurance in Italy, and Augusto Mortara, who, in his work *I Doveri della Proprietà fondiaria e la questione sociale*, suggests state intervention in the tenure of land on behalf of the labourers.

Meanwhile there is no falling off in more strictly technical publications, as on credit, trade, and finance. First among these should be noticed Maffeo Pantaleoni's *Teoria della Traslazione dei Tributi*, skilfully explaining the shifting incidence of taxation. This book, not to mention others by the same author (*v.* works named later), shows how great has been the progress of scientific investigation in Italy. We may mention the labours of MAGLIANI, to whom we owe the most thorough critique of bimetallism, of Ferraris, Stringher, Piperno, G. Luzzatti, De Viti, Loria, Benini, Lorini, in monetary questions to which modern Italian economists, like their earlier brethren, and unhappily for the same reasons, have given much attention. Thus on banks we have works by Boccardo, De Jehannis, the *Storia delle Banche* by Rota, and the *Principii di Scienza bancaria* by Rota and by Ferraris. On rural economy there are the writings of Bertagnolli (*v. Authorities*), and others of equally high quality, by Bianchi, Emilio Cossa, and Sartori. On subjects of applied economics mention should be made of the labours of Graziani (*Teoria delle Operazioni di Borsa*), of Supino in his essay on discount, and especially in his *Navigazione dal Punto di Vista economico*, in which he discusses questions of freight, cost of navigation, and generally the economy of maritime enterprise. The writings of Montemartini and Della Bona on crises are also worth note, of A. Rossi and Benini, both protectionists, on the balance of trade, of Dalla Volta on industrial combination and forms of wages, of De Viti, Salandra, Alessio, Zorli, Graziani, and Puviani on financial questions. Here, too, quite apart from the subjects of the day, mention must be made of the bibliographical series published by a group of writers, Alberti, Montanari, Cusumano, Ricca-Salerno, Fornari, Sinigaglia, Loria, Errera, Gobbi, Supino, Conigliani, Graziani, Balletti, De Viti. Bertolini, under the editorship of Cossa.

The acclamation which in recent years greeted the rise of the AUSTRIAN SCHOOL (*q.v.*) could not fail to excite a fascination on Italian minds. The natural consequence has been a multitude of commentators on the theories of JEVONS, Menger, Böhm-Bawerk, SAX, and Wieser. For instance, Graziani accepts their theory of value in his *Storia critica della teoria del valore in Italia*, and so in part does Pantaleoni in his *Principii di Economia pura*, and Alessio in his essay on value, already mentioned. Again Sax's theories on finance are reproduced in the *Manuale di Scienza delle Finanze* of Ricca-Salerno, and accepted, with certain modifications, by Conigliani in his *Teoria degli Effetti economici delle Imposte*, by Graziani (*Di alcune questioni intorno alla Natura e agli Effetti economici delle Imposte*, 1889; and *Natura economica delle Imposte sulle Successioni*, 1890), and by Mazzola (*I Dati scientifici della Finanza pubblica*, 1887).

Economic study has received a vigorous impulse in Italy through the *Giornale degli Economisti*, an able review, edited by eminent writers with the collaboration of the best intellects in the kingdom. It courageously opposes protection, both agrarian and industrial, which has come to the front of recent years in Italy, to the great injury of national economy, and bestows a keen and conscientious criticism on the monetary and bank policy of the Italian government.

The work of certain other writers does not come under any of the preceding categories. Among these are economists who are free-traders and

optimists, such as Berardi, De Johannis, Martello, Dalla Volta, Bertolini, Todde, Pinna-Ferrà, Pareto, etc., whose organ is *L'Economista*, and a rising knot of authors occupied with socialist theses,—defended with moderation and learning by Napoleone Colajanni in *Socialismo e Sociologia criminale*,—and of which the leading organ is *La Critica sociale*, ably edited by Filippo Turati.

Finally there are some Italian economists whose line of thought diverges from all the foregoing. These see in the analysis of the relations of real property a key by the aid of which they seek to penetrate the yet unsolved problems of the distribution of wealth; following this method they have reached a number of results in the theories of value, currency, profit, interest, rent, population, and the interpretation of economic and political history. The system was set forth for the first time by Achille Loria in *La Rendita fondiaria e la sua Elisione naturale*, 1879; and *Analisi della Proprietà capitalista*, 1889; and applied to sociology by him in *Les Bases économiques de la Constitution sociale*, 2nd éd., Paris, 1893. It starts from an analysis of the economic influences exerted by the presence, or absence, of free land, not like WAKEFIELD, to deduce how new countries should be organised, and still less to mourn with VON THÜNEN over the distribution of wealth obtaining in old countries, but to trace out the organic laws and structure of the capitalistic economy. Amongst Loria's analyses we may mention that which reduces value to *complex labour*, complementing Ricardo's theory; his analysis of money, in which he traces the origin of money, completes Mill's doctrine of international values, and corrects FULLARTON'S theory on *hoards;* his analysis of the distinction between *technical capital* and *wage capital;* his distinction between distribution of wealth, *i.e.* distribution of the produce between wages and income,—and re-distribution of wealth, *i.e.*, distribution of income between earnings of the undertaker (*entrepreneur*), interest on capital, rent of land and taxes; the amount of the bank reserve; the theory of the systematic excess of population; the comparative analysis of the economic development of the American and Australian colonies, and of Europe, showing how the economic relations existing in ancient Europe are reproduced in modern colonies. This system, which has been called "the landed property system of political economy," now counts amongst its partial or thoroughgoing adherents Rabbeno, Nitti, E. Cossa, Garlanda, A. Mortara, Masè-Dari, Flora Sartori, Bianchi, Supino, De Marinis, Coletti, Petrone, and others.

L.

IVERNOIS, SIR FRANCIS D' (1757-1842). A French émigré, was knighted by George III. He returned to France in 1814.

His principal works were : *Tableau historique et politique des pertes que la révolution et la guerre ont causées au peuple français dans sa population, son agriculture, ses colonies, ses manufactures et son commerce*, London, 1799. A work in form too much resembling a party pamphlet, but many of its reflections are valuable ; and *Sur la Mortalité proportionelle de quelques populations considerée comme mesure de leur aisance et civilisation*, Genève, 1832.

[The *Nouvelle Biographie générale*, Paris, 1858, vol. XXV., contains a full notice of him, and lists of works. See also Coquelin and Guillaumin's *Dictionnaire de l'économie politique*, Paris, 1852-1853.] H. E. E.

JACINI, COUNT STEFANO (1837-1891) belonged to a Lombard family of Casalbuttano. He studied in Switzerland, then at Milan by order of the Austrian government, lastly in Germany. In his youth he travelled through Europe and the East. He then applied himself again to study, and published *La proprietà fondiaria e la popolazione agricola in Lombardia*, Milano, 1854 ; 3rd ed., 1857. During a famine in the Valtellina, invited by Maximilian of Austria, then governor of Lombardy, he wrote *Le condizioni economiche della Valtellina*. Mr. Gladstone translated this pamphlet into English to show how intolerable the Austrian rule was in Italy. In 1860 Jacini became minister for agriculture and commerce, Cavour, whom he had supplied with information as to the relations of Austria to Lombardy and Venetia, being Premier.

He gave a strong impulse to the execution of the St. Gothard tunnel. His report to Parliament on that occasion, 25th February 1866, is a good example of his positive method, stating ascertained facts which had been made thoroughly known through a public inquiry. After being appointed a Senator he published several political writings, "Sulle opere pubbliche in Italia nei loro rapporti con lo Stato.—Sulle condizioni della cosa pubblica in Italia dopo il 1866." His positive method made a deep impression on the nation when the Italian parliament, 15th March 1877, ordered an inquiry into agriculture and the position of agriculturists (*Inchiesta Agraria*). The result of this inquiry was published in 15 volumes 4to, 1881-1885, Rome (Tip. del Senato) with a preface

by Jacini, vol. i. containing an explanation of its aim and a statement at the end *Relazione Finale* (vol. xv.) collecting its conclusions which, according to his own words, applied the experimental method to the study of Italy as an agricultural nation. Jacini did not rely on theory, his works show great clearness of observation, he sided with free trade, just when the protective system was cherished by the supporters of agricultural interests. A rich landowner himself, he supported the principle that property is a social necessity if it were only to preserve and to increase agricultural wealth, its defence lies in the service it renders to society. A. B.

JACOB, WILLIAM, F.R.S. (1762?-1851), merchant in London, was appointed in 1822 to the comptrollership of corn returns, which post he retained during twenty years. He was commissioned by the Government in 1825 and 1827 to report on the condition of agriculture in some of the states of northern Europe; the results of his observations are contained in two *Reports* which contain valuable information and very full statistics of the state of land and the agricultural produce of those countries at that period. On the suggestion of Huskisson he undertook an inquiry into the production and consumption of the precious metals. This work shows great research, but is defective, which may be attributed partly, for the more recent periods, to the insufficient historical information available then. But, as regards earlier times, Jacob appears to have put together more information than any one previously, and his conclusions concerning the subsequent and middle ages are quoted as authoritative by many recent writers on the subject, as by Walker in *Money*.

An historical Inquiry into the Production and Consumption of the Precious Metals, 2 vols., London, 1831.—*Report on the Trade in Foreign Corn, and on the Agriculture of the North of Europe. . . . To which is added an Appendix of Official documents, Averages of Prices, etc.*, London, 1826.—"A Report . . . respecting the Agriculture and the Trade in Corn in some of the Continental States of Northern Europe," in the *Pamphleteer*, xxix., 1828, and several other pamphlets on agriculture. R. H. H.

JACTUS NAVIS LEVANDI GRATIA (General Average). When a ship and its cargo are in peril of the sea, and the master of the ship orders a sacrifice of property to be made for the purpose of avoiding the danger, such as that of throwing cargo overboard to lighten the ship, the loss thus arising has to be shared in common between the ship-owner and owners of cargo, *i.e.* among all those who benefit by its having been made. This provision of Roman law was derived from the maritime law of the Rhodians; hence it is called *lex Rhodia de jactu* (see AVERAGE, MARITIME). E. A. W.

JAKOB, LUDWIG HEINRICH VON (1759-1827), a distinguished economist, was born at Wettin. He studied at Merseburg and Halle, and in 1791 became professor of philosophy at the latter place, where he strove to popularise the doctrines of Kant. He lectured also with great success on political economy. The Russian government invited him to fill the chair of economic science at Kharkow, and the suppression of the university of Halle in 1806 induced him to accept the offer. He speedily learned Russian and lectured in that language on political science. He was favoured by the minister Speransky, and in 1809 was called to St. Petersburg as member of an important finance commission. On the re-establishment of the university of Halle, he returned to Germany and resumed his professorial work. The Russian government on his retirement ennobled him and granted him a pension. He was a voluminous writer on philosophical subjects in the earlier part of his career.

Jakob's principal economic publications were: *Theorie und Praxis in der Staatswirthschaft*, 1801; *Ueber die Arbeitleibeigner und freier Bauern in Russland*, 1815; *Grundsätze der National-oekonomie, oder Theorie des Nationalreichthums*, 1805 (3rd enlarged edition, 1825); *Die Staatswissenschaft theoretisch und praktisch dargestellt und erläutert*, 1821. He closely followed Adam Smith, whilst at the same time seeking to place in a clearer light the fundamental conceptions of the science. He translated into German (1807) the treatise of J. B. Say and (1803) Thornton's *Paper Credit of Great Britain*. J. K. I.

JANNET, CLAUDIO (1844-94), after having graduated as doctor of law at Aix in Provence, and as doctor of political sciences at Louvain, practised some time at the bar in Aix. Having been introduced to LE PLAY, he became the most brilliant of his disciples and fellow-labourers, and following his method, made a personal inquiry into the state of the populations of Dauphiné and Provence.

Jannet wrote in 1867 an essay on the *Lex Voconia*, and after having published in 1873 his *Institutions Sociales et le Droit Civil à Sparte*, he returned from a journey in America with his *États Unis Contemporains*—pub. 1876,—a critical examination of the institutions, moral conditions, and ideas prevalent in the great republic after the war of secession; this book, which in thirteen years went through four editions, established the reputation of Jannet as an acute observer, although he certainly did not see American democracy in the same favourable light as De Tocqueville forty years before. However, in his last edition (1889), he is glad to testify that "the political condition of the United States has considerably improved" (see his monographs in the *Ouvriers des deux mondes, e.g.* "Un Metayer de Texas.")

Having been elected the first professor of political economy at the Catholic Institute of Paris, Jannet occupied this chair until the time of his death. According to one who knew him well, he aimed "at following the method of observation and keeping to the exact study of facts, so as to give economic science a solid foundation, and at illus-

trating it by judicious historical descriptions of the past and comparative information derived from both continents, breathing into the whole the spirit of elevated moral thought." This object he successfully attained, both in his academic lectures and in the two large works published during this period: *Le Socialisme d'État et la Réforme Sociale*, 1889, and *Le Capital, la Spéculation et la Finance au XIX^e Siècle*, 1892. Jannet probably was the most scholarly and certainly one of the best and most widely informed of the French economists of his generation; with a marked Roman Catholic and conservative bias, his standpoint is the standpoint of unrestricted economic liberty combined with a due acknowledgment of the relativity of economic phenomena and deep religious and moral convictions. To socialistic schemes of reform, whatever might be their origin, he was firmly opposed; although he admitted that the rise of *Kathedersocialismus* was the natural outflow of the past history of Germany, he would not admit that a socialistic legislation could achieve its supposed ends even in Germany. Denying thus to the state any right of interference with questions of production, distribution, and consumption, he however, recommended in case of need a liberal policy of *subventions*, to be provided as well by the masters (*patronage*) as by communal and corporation funds. In common with LE PLAY, he consistently strove to obtain the reform of the French law of bequest, and to restore the power of paternal authority on this point as a remedy against rural depopulation and the demoralisation of the wealthy classes of society. Jannet was a frequent contributor to the leading French periodicals, such as the *Réforme Sociale*, the *Économiste Français*, the *Correspondant*, the *Revue des Deux Mondes*, and the *Polybiblion* (see BEQUEST, POWER OF). E. Ca.

JANSSEN, SIR THEODORE (d. 1748), director of the SOUTH SEA COMPANY, contributed several articles on the trade between Great Britain and France to the *British Merchant*, edited by Charles KING (*q.v.*), during the controversy on the commercial treaty with France in 1713. Of the papers afterwards republished as the *British Merchant*, 3 vols. 8vo, London, 1721 and 1743, Janssen was the author of *General Maxims in Trade, particularly applied to the Commerce between Great Britain and France*, reprinted in the *Somers Tracts*, 4to, 1752, vol. iv.; 4to, 1809, vol. xiii. After giving a short summary of the principles of the MERCANTILE SYSTEM (*q.v.*) in the form of "maxims in trade assented to by everybody," he discusses the various branches of English commerce which would be affected by the proposed treaty with France, and concludes that "the high duties are the only fence we have left against an inundation of French commodities upon us," and that if the treaty were carried into effect "our capital stock of gold and silver would be diminished." The treatise has no scientific value, but it is a good illustration of the mercantile system in its most unreasonable form. It appealed to the prejudices of the merchants, whose vigorous opposition to the treaty secured its rejection.

[For further particulars of Janssen's career *vide Dictionary of National Biography*.] W. A. S. H.

JARROLD, THOMAS (1770-1853), a physician, born in Essex, and educated at Aberdeen, practising first at Stockport, then at Manchester, was the author of *Dissertations on Man, Philosophical, Physiological, and Political, in answer to Mr. Malthus's Essay on the Principle of Population*, 1806.

He thinks Malthus has not sufficiently noticed that increase of food depends on human action (29-30); also there is no proof that, where discomforts are great, increase of population is slow, and *mutatis mutandis* (16, 17). Vice, for example drunkenness, is not only sometimes a check, but sometimes a cause of population (38 *seq.*). Dr. Jarrold draws on his medical experience, and this gives his book a character of its own. "During three years, I have attended with considerable care to the diseases of the poor of the town of Stockport, and in that period have not seen fewer than 5000 sick persons who then were or had been employed in manufacturing cotton" (60). He thinks the factory children (200 in number) were healthier than those of other occupations, though factory work is that "to which the eyes of the public are directed with the most watchful jealousy." If there were more of his own experiences and less of his criticisms, which are seldom well-founded, the book would have been of greater value. His paradox, that "an unsound constitution in a civilised country most commonly proves prolific" (305), has found supporters in our own days; but is hardly a demonstrable any more than a comfortable doctrine. Few will agree with him now in condemning Malthus for finding "an analogy in principle" between the vegetable, animal, and human kingdoms in respect of increase (329), or in regarding Malthus as destitute of due faith in Providence (327 *seq.* cp. 364). If the book in its main arguments has a family likeness to many other refutations of Malthus, it is at least superior to most of them in moderation of tone.

His other writings were — *Letter to Samuel Whitbread, M.P., on the Poor Laws*, 1807.— *Anthropologia or Dissertations on the Form and Colour of Man* (Stockport), 1808.—A paper on National Character in *Transactions of Manchester Literary and Philosophical Society*, 1811.—*Instinct and Reason philosophically investigated with a view to ascertain the Principles of the Science of Education* (Manchester), 1836.—*Education of the People*, Part I. (Manchester), 1847. J. B.

JARVIS, EDWARD (1803-1884), born in Concord, Massachusetts; lived in Boston. He was educated as a physician, and devoted much attention to vital statistics. He edited the vital statistics of the United States census of 1860, published in vol. iv. of the census of that year; and contributed many papers to periodicals and societies on subjects relating to the increase of the population.

Among these may be mentioned *The Increase of Human Life*, and *Infant Mortality*, Boston, 1873.

He was the second president of the American Statistical Association, serving from 1852 until his death. D. R. D.

JENKIN, HENRY CHARLES FLEEMING (1833-1885), an eminent electrician, and professor of engineering at the university of Edinburgh, deserves notice here as having contributed to political economy some very original papers of the highest theoretical importance and of considerable practical interest.

In a paper on "Trade Unions," in *North British Review*, 1868, Jenkin refutes the belief that unions cannot be economically beneficial to their members, by a masterly analysis of the law of demand and supply. He represents the relation between price and demand by a *function*: $D=f\left(\frac{1}{x}\right)$; or, more elaborately, $D=f\left(A+\frac{1}{x}\right)$; where x is the price, and A is an unknown constant; so that the decrease of x, or increase of $\frac{1}{x}$, corresponds to what has since been called an "extension" of demand, the increase of A to a "rise" (see COURNOT). Similarly, the equation $S=F\ (B+x)$ expresses the relation between price and supply. The equation $F\ (B+x)=f\left(A+\frac{1}{x}\right)$ determines the price x. Descending to practical details, the writer discusses, in the light of first-hand knowledge, the policy of trade unions with respect to piece-work, over-time, and other arrangements. Much weight attaches to his advice as to the rights and limitations of combination.

In the paper on *The Graphic Representation of the laws of Supply and Demand, and their application to Labour*, 1868, resuming his mathematical analysis, he continues to show "how much the value of all things depends on simple mental phenomena, and not on laws having mere quantity of materials for their subject." He constructs a demand curve and a supply curve virtually identical with Cournot's constructions. "In a given market, at a given time, the market price of the commodity will be that at which the supply and demand curves cut." Jenkin calls this the *first* law of demand and supply. Attention should be called to the statement (*Papers*, p. 86) that "the law only comes into operation where buyers and sellers can approximately estimate whether at a given price the quantity wanted or the quantity for sale is the greater." The *second* law formulates the effect on price of an increase of the "whole supply," or of the "whole purchase fund." The *third* law is: "In the long run the price of the manufactured article is chiefly determined by the cost of its production, and the quantity manufactured . . . by the demand at that price." Here "cost of production is no one fixed cost, constant for all quantities"; and the first and third laws seem to differ only as "*short periods from long.*" In applying these laws, Jenkin conceives the action of a combination as modifying the supply curve. "The legitimate action of trade unions is to enable the labourer to set a reserve price on his merchandise." . . . "The power of bargaining, or, in other words, of reserving some of the goods for sale, may lower the supply curve." . . He employs largely the conception of the "cost of production of a labourer"; from which he deduces just conclusions as to the importance of a high standard of life.

The paper on the *Incidence of Taxes*, 1871, opens with a brilliant exposition of the principle now known as CONSUMER'S RENT. Jenkin had re-discovered not only the general theory which Dupuit first propounded, but also the particular approximation by which Dupuit made it applicable (DUPUIT, *Papers*, p. 114). The effect of a tax on price is represented by Jenkin in much the same way as it had been by Cournot. In conclusion, he discusses two particular taxes —on houses and on rent; employing in the treatment of the latter subject a supply curve of a very peculiar construction.

The *Time-labour System* is a proposed new form of contract between men and masters. Men are to be engaged for a long period—say, six months,—each man is liable to dismissal, but the master engages to receive as substitute any competent workman, at the same wages, for the unexpired period. Also, each man is free to throw up his employment on condition of finding a competent substitute. The object is to correct the characteristic imperfection of the labour market—namely, that a master cannot take on a few additional men at an advance of wages without raising wages all round.

In the paper entitled *Is one man's gain another man's loss?* Jenkin enhances some elementary principles of economics by the physical metaphor of a "closed circuit," round which money travels in one direction, goods in another. "If we imagine all our closed barter circuits drawn as lines from man to man, with arrowheads to show which way the goods travelled, every man [in an imaginary isolated community of workers] would have as many lines coming into him as went out."

The papers described here are published—some for the first time—in *Papers Literary, Scientific*, etc., London, 1888, 2 vols. 8vo, edited by Sidney Colvin and J. A. Ewing, with a memoir by Robert Louis Stevenson in his most charming style. F. Y. E.

JENNINGS, RICHARD (flourished in the middle of the 19th century), of Trinity College, Cambridge, will be remembered as one of those who in Jevons's words first "clearly appreciated the nature and importance of the law of utility." In his *Elements of Political Economy*, conformably to the definition of the subject as the relation between human nature and exchangeable objects, Jennings begins with psychology and physiology. He distinguishes two kinds of

commodities — *primary* and *secondary*: the former exciting nerves of common sensation, *e.g.* the sensation of warmth or cold, and that which follows the satisfaction of hunger; the latter exciting nerves of special sensation, sight, hearing, smell, etc.—roughly corresponding to necessaries and luxuries. The difference between these classes is that "necessaries may confer their full amount of satisfaction in the absence of luxuries; while luxuries cannot be enjoyed by those who want the necessaries of life." Another difference is that "the satisfaction which is derived from objects which affect the special senses is less dependent on quantity." Here reference is made to what is now called the LAW OF DIMINISHING UTILITY, thus formulated by Jennings. "With respect to all commodities our feelings show that the degrees of satisfaction do not proceed *pari passu* with the quantities consumed—they do not advance equally with each instalment of the commodity offered to the senses and then suddenly stop—but diminish gradually until they ultimately disappear" (p. 98). The law of increasing disutility is stated with corresponding clearness (p. 120). That its operation is more marked in the case of bodily than that of mental labour is an important observation. There is much more psychology, but of a less original character.

In the second book, Jennings applies his principles to the phenomena of exchange. He anticipates that economic theories "may be expressed in figures" . . . "exhibited in the formulæ, and analysed by the different methods of algebra and fluxions." He looks also for rather drastic applications of the new political economy. Thus one of his proposals is that a considerable share of the property of proprietors dying without leaving near relations should revert to the state.

A similar vein of suggestion is found in Jennings' later work, *Social Delusions* . . . Convinced that, "in determining the incidence of taxation, the condition of women is an object worthy of attention," the author proposes to tax the employment of men in domestic service and in shops, in order to make room for women in those callings (p. 115). The proposal that we should select our statesmen by a sort of examination in the theory of value shows a certain want of humour. A similar criticism applies to much of the tirade against fallacies. The second work does not form an advance upon the first.

Natural Elements of Political Economy, 1855. —*Social Delusions concerning Wealth and Want*, 1856.

[*Athenæum*, 1856, p. 898.—*Westminster Review*, July 1856.—Jevons, *Theory of Political Economy*, ch. iii. p. 59, 2nd ed.—Cairnes, *Character and Logical Method of Political Economy*, pp. 56, 110, 224.] F. Y. E.

JENYNS, SOAME (1704-1787), poet and miscellaneous writer, sat in parliament from 1742 till 1780, and was a lord commissioner of the board of trade and plantations, from 1755, until it was merged with another department in 1782.

Jenyns' economic writings, probably owing to his official position, attracted attention at the time beyond their deserts. His views on economic questions are generally unsound, and he is not consistent; he imputes the high price of provisions, about 1767, to the national debt, and to the increase of individual wealth, which increase he also attributes in part to the national debt. These opinions are only noteworthy inasmuch as they are an instance of the mistakes made by contemporary observers, even when well placed for observation, in recording the events which passed under their eyes. He maintained the right of the home government to tax the American colonies at will. Of his writings, which have been collected by his biographer, Cole, into four volumes (1790), those dealing with economic questions are—

Thoughts on the Causes and Consequences of the present High Price of Provisions (1767).—*The Objections to the Taxation of our American Colonies by the Legislature of Great Britain briefly considered* (1765).—*Thoughts on a Parliamentary Reform* (1784).—*Thoughts on the National Debt* (first printed in Cole's edition, 1790).

[*Biographical Memoir*, prefixed to C. N. Cole's edition of Soame Jenyns' works, 1790.—Chalmers's *Biographical Dictionary*.—R. Anderson, *Complete Collection of the Poets of Great Britain*, vol. xi. 1794, p. 983.] R. H. H.

JETONS DE PRESENCE (Fr.) are the form in which attendance fees are paid in France to directors or members of committees in public companies or societies when the functions are presumed or declared to be honorary. Some companies give a *jeton de presence*, usually ten francs, to shareholders who attend the annual meetings. The *jetons* are generally silver medals specially coined, bearing the name of the company, and which may be exchanged for their nominal value in cash. Rich directors frequently keep them to use as counters for card-playing at home.

JETSAM AND FLOTSAM. See FLOTSAM AND JETSAM.

JEVONS, WILLIAM STANLEY (1835-1882), one of the greatest English economists of the 19th century, was born at Liverpool. His father, Thomas Jevons, was in the iron trade, and interested in all the new engineering schemes of his time. His mother, Mary Ann Jevons, was the eldest daughter of William Roscoe, the author of the *Life of Lorenzo de Medici*, a man of much learning and refinement. Her mind had been cultivated by constant companionship with her father and by the intellectual society which she enjoyed under his roof. She was a person of considerable poetical talent and strong religious feeling. W. S. Jevons, the ninth child of these parents,—with other

relations of much education and ability,—was thus early brought under influences which assisted to develop his mind and character. His mother encouraged her children in their love of drawing and music. She "carefully fostered," W. S. Jevons wrote, "a liking for botany, giving me a small microscope and many books, which I yet have. Strange as it may seem, I now believe that botany and the natural system, by exercising discrimination of kinds, is the best of logical exercises. What I may do in logic is perhaps derived from that early attention to botany."

Early in 1846 Jevons was sent to the Mechanics' Institute High School, Liverpool, of which Dr. W. B. HODGSON, afterwards professor of political economy in Edinburgh, was then head-master. In 1850 he entered University College School, London, and in 1852 matriculated at the University of London, with honours both in chemistry and botany. Meanwhile the means of earning a livelihood had to be sought, and Professors Williamson and Graham, who had observed his great ability and power of work in the college laboratory, recommended his appointment as assayer to the new mint at Sydney. Further study in other directions had now to be checked. He studied assaying at the Paris mint, and in 1854, when not yet nineteen, sailed for Sydney. He remained five years in Australia, filling his post at the mint with skill and success. The study of meteorology attracted him strongly, and he devoted himself to it with his wonted thoroughness. His interest in later life in recording the periodicity of the "sun-spot" disturbances and the connection between these and changes in the seasons, the price of corn, and commercial crises, was doubtless quickened by these investigations. During this period, political economy also appears to have attracted his attention.

His position at Sydney was an honourable one. The income was considerable, the more creditable to him because attained at so early an age, and the more important because he was now entirely dependent on his own exertions. But an ardent desire for further opportunities of mental improvement overcame all other considerations. "Another year's regular hard study," he wrote to his sister Lucy (Mrs. John Hutton) in 1858, "especially at my increased age, will be invaluable, and its loss would be regretted to the end of my life." He returned to England in 1859, re-entered University College, took the B.A. degree 1860, the Ricardo scholarship the same year, the M.A. with a gold medal 1863. He was, 1866, appointed professor of logic and mental and moral philosophy and Cobden lecturer on political economy in the Owens College, Manchester, posts which he held till 1875, when the strain of increasing work, coupled with somewhat failing health, compelled him unwillingly to resign. In the same year, 1875, he was elected professor of political economy in University College, London, a post which he retained till 1880.

Jevons was elected Fellow of the Royal Society in 1872. He married, in 1867, Harriet Ann, third daughter of Mr. J. E. Taylor of Manchester, founder and proprietor of the *Manchester Guardian* paper. His marriage was an eminently happy one. His love for music was a constant solace. He had constructed himself a very well-toned organ for his house, and was an unusually accomplished musician.

Though reserved in character, he was a very pleasant companion and extremely instructive in conversation. One who had the advantage of knowing him, and frequently experienced the help which his powerful mind brought to the solution of any economic problem, remarked of his conversation, "It was more like talking with an early Greek philosopher, if one can realise what that would have been, than with one of our contemporaries."

Perhaps the most remarkable feature in his life was his early and unswerving conviction that he was destined to do some great work, his entire devotion of himself to preparation for it, and afterwards his unhesitating renunciation of anything, however tempting, that seemed to stand in the way of it. Thus in 1851, when he was sixteen, he writes, "I began to think that I could and ought to do more than others,"—in 1857 when twenty-two, that he has "one wish, or one *intention*, viz. to be a *powerful good* in the world,"—in 1863, when twenty-seven, and saddened by want of immediate success on his return from Sydney, he still sees a hope in his "capacity of seeing the sameness and difference of things, which if history and . . . experienced men are to be believed, is a rare and valuable kind of power." His subsequent career was the carrying out of these convictions. He could let nothing draw him aside from the endeavour to carry out his scientific career to the utmost limit of his capabilities.

While it is primarily as an economist that Jevons claims attention in the *Dictionary of Political Economy*, his researches as a logician and a student of scientific method cannot be ignored. Indeed it will be convenient to begin with an examination of the *Principles of Science*, in which Jevons sums up and applies the results of his long and severe researches in logic. He bases his system upon the generally received axioms that "whatever is is," that "a thing cannot both be and not be," and that "a thing must either be or not be." But to these he adds the principle of "the Substitution of Similars," that is to say, the axiom that whatever is true of A is true of everything that cannot be distinguished from A in the relation contemplated. Thus if B is identical with A then B may be substituted for A in any assertion that has been shown to be true of A. The next and crucial step is to bring every proposition into the form of the assertion of an identity. Thus the proposition "men are mortal" becomes in Jevons's system "man" is the same as "mortal man." Therefore if anything can be said of "man" the same can be said of "mortal man," and if "man" can be predicated of any subject, "mortal man" can be predicated of the same subject. Now whatever may be thought of the psychological principle that a proposition *is* the assertion of an identity, it is unquestionable that it logi-

cally *involves* such an identity. Jevons can therefore throw his propositions into a form which at once admits of the application of the principle of the "substitution of similars." Let us take the two propositions (1) "Cæsar" is the same as "the man Caesar"; (2) "man" is the same as "mortal man." Now (2) enables us to substitute "mortal man" for "man" in (1), and we have "Cæsar" is the same as "the mortal man Cæsar"; or symbolically putting A for Cæsar, B for man, and C for mortal, we have (1) A is the same as AB, (2) B is the same as BC, whence by substitution A is the same as ABC. It is now possible to elaborate a system in which every proposition shall be convertible, and to found upon it a symbolical manipulation of terms, with its appropriate algebra, that constitutes an indefinite advance upon the "Barbara, Celarent, etc." of Petrus Hispanus. Having reduced deductive reasoning to a mechanical process, Jevons found no insuperable difficulty in constructing a syllogising machine; but he regarded this triumph as possessing little practical though considerable theoretical significance. From his reconstruction of deductive reasoning Jevons goes on to contend that induction is an inverse process entirely dependent upon the laws of deduction for its validity. The next step is to show that mathematics is but a special application of logic, and that the mathematical equation is subject to precisely the same laws as the logical identity, the apparent difference being due to the universal presence in the equation of certain limiting conditions which are not assumed unless expressly stated in the logical identity. The doctrine of chances is now developed in immediate dependence upon the law of "substitution of similars"; for the root principle of the doctrine of chances is that inasmuch as belief ought to depend upon the distribution of our knowledge and ignorance, therefore we should believe the same about one event as we believe about another, our knowledge or ignorance of which is the same. The doctrine of chances in its turn is made the basis of the whole system of scientific investigation and induction, in the development of which Jevons's genius finds a thoroughly congenial field, and in which the scope of his scientific reading becomes manifest.

We will pass from this treatise on method to a collection of writings on currency and finance, which forms an almost ideal application of the "principles of science" to a group of problems of equal complexity and importance. The volume contains papers written at every period of Jevons's literary life, and, as Professor Foxwell remarks in his preface, it is not till they are read together that the impressive unity of conception, firmness of grasp, and tenacity of scientific purpose which they reveal can be adequately felt. With equal patience and sagacity Jevons separates out the sæcular from the periodic variations in the phenomena of price, discount, pressure on reserves, frequency of bankruptcies, and so forth. His elaborate logarithmic and other tabulations are models of sound method and laborious research illuminated by theory, not likely soon to be superseded. His brilliant attempt to bring the periodicity of commercial fluctuations into connection with that great physical period which is indicated, for instance, by the changes in the aspect of the sun-spots and the electrical condition of the earth, if not conclusively successful, is suggestive of the highest range of physico-economic law which we are ever likely to attain. From his examination of the actual phenomena of the currency, Jevons proceeds to the discussion of questions of monetary policy, both domestic and international. He deals with such questions as the possibility of an international coinage, the principles of note-issue, the best means of maintaining the standard weight of coins, and of securing (by the institution of a compound unit of value) an assured stability in the standard of deferred payments. On the now burning question of bimetallism, Jevons's position, though perfectly unequivocal, is almost certain to be misunderstood by those who know it only at second hand. He fully recognises the serious nature of the evils deplored by bimetallists, and the theoretical possibility of maintaining a fixed ratio between gold and silver by international agreement; but the precarious nature of such an agreement, and the danger of sudden disturbance to existing obligations, appeared to him to be fatal objections. Thus bimetallists and monometallists alike appeal, with perfect sincerity and justice, to the authority of Jevons at one point or another of the argument, and it may be confidently asserted that when the controversy is waged within the lines laid down by Jevons, the era of scientific discussion will have definitely begun, and a decision on scientific grounds will not be far distant.

In addition to his studies in finance, Jevons treated a great variety of questions relating to state control and management. On the broad principle of state socialism and individualism Jevons was without prejudices. His determining principle was purely Benthamite. "Will a measure increase the sum of happiness?" was the only question which he would admit as ultimately relevant. But the evidence upon which we must rely for an answer is often ambiguous, always in large part indirect, and generally conjectural. Hence the necessity of extreme caution in arriving at conclusions, together with a considerable degree of boldness in hazarding experiments. Our only guides are experience and analogy; and wherever experience seems to contradict analogy, as will often be the case, our rule must be to analyse more carefully and so correct the analogy, instead of

ignoring or denying the experience. Following these principles, Jevons collected a vast mass of information on social questions, and analysed it so scrupulously that his work is almost equally valuable when experience has confirmed and when it has contradicted his anticipations. In examining questions of state action, Jevons very carefully distinguishes between state *control* of private enterprise and state *management* of enterprise. With reference to the former, we can only say that there is a presumption against interference, in so far as unimpeded freedom must be held to be a source of happiness, and therefore any restriction of freedom an evil. But this presumption must yield in innumerable instances to the demonstrated fact that greater happiness has resulted from control. A conspicuous instance is furnished by the FACTORY ACTS, and Jevons would gradually extend their principle so as to prohibit altogether the employment of child-bearing women in factories. The conditions under which state management, as distinct from state control, is likely to be advantageous, were submitted by Jevons to a rigorous analysis, which ought to be the starting-point of all discussions of the subject. The conditions he held to be favourable to state management are as follows: (1) where numberless wide-spread operations can only be efficiently connected, united, and co-ordinated in a single all-extensive government system; (2) where the operations possess an invariable routine-like character; (3) where they are performed under the public eye or for the service of individuals who will immediately detect and expose any failure or laxity; (4) where there is but little capital expenditure, so that each year's revenue and expense account shall represent with sufficient accuracy the real commercial conditions of the department. An exhaustive examination of the facts, with reference to these criteria, led Jevons to pronounce in favour of the state management of telegraphs and telephones, and the establishment of a parcel post, none of them accomplished facts when he wrote; but against the state management of railways, which however should be strictly controlled in the interests of the community. It may be mentioned that Jevons had a strong dislike and suspicion of trade unions, based on grounds of economic theory. But he looked for their gradual transformation into co-operative societies, and would leave them absolutely free. On similar grounds he placed small hope in methods of arbitration and conciliation, trusting rather to the free play of competition. It should be noticed in connection with labour questions that Jevons never lost sight of the vital distinction, so generally overlooked, between the horizontal cleavage of the industrial community into various grades of skilled and unskilled labour, managers, capitalists, landowners, and so forth, and the vertical cleavage into the agricultural interest, the coal interest, the iron interest, etc. Through neglect of this distinction a class movement and a trade movement may easily be confounded. Jevons had a profound faith in the future of industrial partnerships—a faith that survived rude shocks, for he frankly owned that English experience was against him, and that French experience is always unsafe ground for reasoning by analogy to England.

The mass of work already reviewed is great; but we have still to notice the treatise by which Jevons's place in the history of economic theory will ultimately be determined. In his *Theory of Political Economy* he attempts nothing less than the reconstruction of the science of economics as the calculus of human satisfactions. Production derives its whole significance from consumption; that is to say, from the satisfactions to which it ministers; and the significance of any special unit of product is due to the increment of satisfaction which it is capable of producing. Hence the scale of equivalence of any two commodities is determined by the scale of equivalence of the increments of satisfaction which they are capable of producing. Exchange value then is determined by incremental efficiency as a producer of satisfaction. But this incremental significance is not absolutely fixed. It depends on the amount of the commodity already possessed or enjoyed by the individual or the community whose satisfaction we are considering. Thus we obtain the formula that if $F(x)$ represents the whole significance, or value in use, of a commodity to its possessor, then $F'(x)$ will represent the significance of an increment of it to him, or in other words, will be the gauge of its exchange value (see DEGREE OF UTILITY and FINAL DEGREE OF UTILITY). Should the incremental efficiency, and so the exchange value of the product of a given combination of productive efforts be greater when such efforts are turned into one channel than when they are turned into another, this fact will determine the course they will actually take. The more significant product will therefore be increased in quantity, and the less significant decreased. Hence the incremental significance of the former will decline, and that of the latter will rise, until there is equilibrium. There will now be equivalence between the relative expenditures of productive effort and the relative values of the product; though it will not be the cost of production that has determined the value of the products, but the (anticipated) value of the products that has determined the direction of productive effort. These principles, together with the "law of indifference"—in reality a new application of the "substitution of similars"—enable Jevons to throw the theory of exchange into the form of systems of equations. From this we must inevitably proceed to the theory of distribution.

Value had long been recognised as the cause and not the effect of rent. Jevons declared it to be the cause and not the effect of wages also. Hence the theory of distribution must be built up afresh, taking as the starting-point the significance of the product to the consumer. Jevons has left much for his followers to do in working out this theory. The form of his equations is open to just criticism. He seems hardly to have realised the full consequences of his method. But none the less his *Theory of Political Economy* has succeeded in its aim. When all its implications have been worked out the science will be reconstituted. On the questions of priority and originality, cp. arts. on COURNOT; GOSSEN; and the works of Walras and Menger.

In addition to the above, Jevons wrote a considerable number of technical and miscellaneous essays on scientific and social subjects, an industrial treatise, *The Coal Question*, dealing with the possible exhaustion of our coal mines, which had a powerful influence in initiating the serious attempt to pay off the national debt, and a number of more or less elementary and popular books on logic, monetary science, problems of state management and control, and political economy.

In reviewing the whole work of this bold and patient thinker, it is impossible not to regard his death,—in the plenitude of his powers, and in the midst of works which promised to equal anything he had yet done in significance,—as one of the heaviest losses that science has suffered in our generation.

A full bibliography of Jevons's works appears in Appendix B to his *Letters and Journal*, 1886, edited by his wife, which contains a classified list of his principal works, with the dates of their first issue or collection. *Primer of Logic*, 1876. — *Elementary Lessons in Logic*, 1870. — *Pure Logic and other Minor Works* (collected), 1890. — *Principles of Science*, 2 vols., 1874. — *Studies in Deductive Logic*, 1880. — *The Coal Question*, 1865. — *The State in Relation to Labour*, 1882. — *Methods of Social Reform* (collected), 1883. — *Money*, 1875. — *Investigations in Currency and Finance* (collected), 1884. — *Primer of Political Economy*, 1876. — *Theory of Political Economy*, 1871. — *Principles of Economics*, a fragment, 1905. — "Fall in Gold," 1863, in *Investigations*. — Art. on "Cantillon." — *Contemp. Review*, Jan. 1881. — Art. on "Bimetallism," *Contemp. Review*, May 1881. P. H. W.

JEWS, ECONOMIC POSITION AND INFLUENCE OF, IN ENGLAND. The Jews lived in mediæval England for rather more than two hundred years, from shortly after the Norman conquest till 1290. During the whole of that time they were without any share in the national or municipal life of the country; and, as far as our knowledge goes, no large section of them followed, except for the sixteen years from 1274 to 1290, any occupation except that of dealers in money. But their relations to the king, and to the various orders of the nation, underwent considerable changes during their residence, and their history is divided into three clearly-defined periods.

I. (From the Conquest to 1194.) The first body of Jews came to England from Rouen shortly after the Conquest, at the invitation, it is said, of William the Conqueror. They were no doubt from the first in a position of dependence on the royal favour and protection, for there was no feudal or customary law to which they could appeal. From William Rufus, Henry I., Stephen, and Henry II., they met with support and encouragement. By the two Henrys especially they were upheld in the possession of a body of privileges which allowed them to go where they pleased throughout England, to buy or receive in pledge whatever was brought to them, except things of the church, to settle in any town where they chose, free alike from the payment of local tolls and taxes, and from the jurisdiction of the local courts, and finally, to hold land in pledge or fee. They enjoyed the royal favour because they helped to fill the royal exchequer. The earliest extant pipe roll contains entries of fines and amercements of the Jews, and of payments rendered by them to the king in return for help received from him in the recovery of money that they had lent on interest. We have very little information as to the amount of their annual contribution to the exchequer, during the earlier part of this period; but in the latter half of the 12th century, when the royal income was about £35,000, the Jews cannot have paid less than £3000 a year. And besides this, they helped the king by making advances to him, to be repaid when the collection of the FARM of the counties should provide him with a fresh stock of ready money.

The wealth that enabled them to provide so considerable a proportion of the royal income, was drawn from the proceeds of the business that they carried on, men and women alike, singly and in firms, as the only great money-lenders in the kingdom. Barons who were impoverished by war, crusading, litigation, or extravagance, and religious houses which had suffered from bad management, the claims of hospitality, or the expense of new buildings, had no way of raising ready money except by pledging to the Jews some of their lands or other possessions. Hence they spread throughout the country, and their communities became large, rich, and numerous. They were recognised as being the "royal usurers," and, as such, entitled to take up their position in towns which might otherwise have been closed to them. For, although they had friendly relations with some Christians, they were generally regarded with superstitious dislike, and on various occasions the charge of murdering or

mutilating Christian children was brought against them, and widely believed to be true. But there was no great demonstration of the general dislike in which they were held till 1189. In that and the following years fierce popular attacks were made on them in London, York, Colchester, Norwich, Lynn, Stamford, Bury St. Edmunds, and Lincoln. The loss to the royal exchequer that ensued, and the evident possibility of a recurrence of the massacre, suggested to Richard I. the necessity of still further securing the safety of the Jews, and of the revenue that they yielded. He therefore introduced, in place of the old informal protection, a thorough organisation of the Jewry as a branch of the royal administration. The Jews were henceforth bound to register all their debts, pledges, mortgages, lands, houses, and rents; and were allowed to enter into no contracts, except in certain towns, which were selected by the king for the purpose, and in each of which was maintained a staff of lawyers, registrars, and custodians, for the purpose of witnessing and enrolling every bond to which a Jew was a party, and of preserving in sealed chests an indented portion or "chirograph" of each. Moreover, special justices or proctors were appointed to settle all disputes between Jews and Christians.

II. (From 1194 to 1274.) Richard's organisation of the Jewry was introduced in 1194, and from that year to the end of their residence in England, the Jews occupied the position of complete subordination to the king, which it marked out for them. Their dependence on the king, and on him alone for protection, their absolute want of all legal rights to life or property, and the obligation imposed on them of rendering to the royal officers an account of all their possessions, and of transacting all their business under supervision, made it impossible for them to escape any burden that they might be called on to bear. And their masters showed them little mercy. Sometimes the king made a free grant to a favoured subject of land on which a Jewish mortgagee had claims, sometimes he cancelled the obligation of a Christian debtor to a Jewish creditor. But the royal attacks were often made on a much larger scale. John, in 1210, plundered the Jews, and reduced them to such a state of need that "they prowled about the city like dogs" (*Chronicles of Lanercost*, p. 7). Henry III. exacted from them a third of their property in 1230, another third in 1239, 20,000 marks in 1241, 60,000 marks in 1246, and great sums, of which the amount is not stated, in 1243, 1244, 1250, 1252, 1254, and 1255. So unsparing were the royal demands that in 1210 many of the Jews left the country, and in 1254, and again in 1255, their chief representatives entreated Henry III. to give the whole community permission to do so. But the request was refused.

It was during the reign of John and the first forty years of the reign of Henry III. that the Jews yielded the greatest revenue to the royal treasury. It has been calculated that the annual average tallage alone amounted at one time in the 13th century to £5000 (*Papers of the Anglo-Jewish Historical Exhibition*, p. 195); and, besides this, their escheats, fines, amercements, reliefs, and fees of all kind must have made up a large sum.

Nevertheless, profitable as they were, the royal power could neither protect them completely against plunder, nor maintain them in possession of all the unpopular privileges that made them rich. Their right of settling wherever they wished in England was gradually taken from them, owing no doubt to the dislike with which, on account of their immunity from local jurisdiction and taxation, their foreign origin, their religion, and their occupation, they were regarded by the towns. Special decrees of expulsion were obtained against them by Bury St. Edmunds, Leicester, Newcastle, Wycombe, Southampton, Berkhampstead, Newbury, and Derby, at various times between 1190 and 1263; and in 1245 a general order was issued by the king that henceforward no Jew was, except with the royal permission, to settle in a town where Jews had not formerly been in the habit of dwelling. This restriction must have seriously affected their power of acquiring the wealth that they needed to meet the royal demands. And they were exposed also to more direct attack in the towns. The Jewry of London was plundered by a riotous crowd in 1204, that of Norwich in 1234, and those of Oxford and Bristol later on.

Far more serious, however, than the enmity of the towns was that of the barons. In the constitutional struggle that preceded the civil war, the whole baronial party saw its efforts after reform thwarted because the king, when supplies were refused, could fall back on the Jewry; and the Great Council attempted, apparently with little effect, to secure a share in the management of the Jewish revenue. But the lesser barons had, in addition, personal grievances of their own to avenge. Many of them had had to mortgage to the Jews lands which had then passed by sale into the possession either of greater barons (*Petition of the Barons*, § 25, in Stubb's *Select Charters*, etc., pp. 385-386), or of religious bodies (cp. Burton, *Chronica Monasterii de Melsa*, Rolls series, *passim*), and were thus irretrievably lost to their former owners. And the same thing might happen to any land that was pledged to a Jew. Hence, during the civil war, the barons lost no opportunity of attacking the Jewries and destroying the deeds in which debts were recorded. Between 1262 and 1268, the Jewries of London, Worcester, Cambridge, Winchester, Canterbury, Exeter, Northampton, and Lincoln were sacked; some by De Montfort, some by his sons and

adherents, some by the freebooters who after his death represented his party.

On the restoration of tranquillity, the king's son, Edward, the patron of the cause of the "knights bachelors," could not but take up the work of restoring to its former knightly holders such of the land of England as had passed into the possession of the Jews. An attempt of this kind, indeed, was in thorough harmony with Edward's lifelong policy of trying to rescue the feudal organisation from the confusion into which it had begun to fall, in consequence of the transference of land from holders who could render military service to such as, like religious corporations and Jews, were unable to do so. Henry III. had already safeguarded the royal estates by forbidding the tenants on them to pledge their land to the Jews (*Norfolk Antiquarian Miscellany*, i. 328); but on other estates there was no legal check on such alienation. Jews could be "seised" of lands, and some of them were recognised holders of portions of knights' fees. Edward determined to defend the land of all feudal holders in the same way as the royal demesne was defended. The loss that would be caused to the royal income by the imposition of the necessary restrictions on Jewish transactions was less serious now than it would have been earlier in the reign, for the exactions of Henry III. and the attacks of the barons had impoverished the Jews; and it was compensated by a political gain, since a policy of the kind accorded with the prejudices of the knightly class at the same time as it protected the feudal organisation to the king's advantage. The church also, like the baronage, had its lands encumbered with obligations to the Jews, and was eager to welcome restrictive measures. The consequence of this combination of forces was that, in 1269, a statute was passed enacting that from that time forth no land should be pledged to a Jew as security for the repayment of money, and cancelling some of the agreements to that effect that had already been entered into; and in 1270 it was followed by a second statute which made it unlawful for Jews to acquire English land, not only by way of pledge, but even by purchase, and which ordered that all land in the possession of Jews was to be restored to its original Christian owners.

These measures made Jewish usury on a large scale practically impossible in the future; for they forbade Jews to remain in possession of the only widely distributed commodity that could serve as a security for advances. Four years later, an even more severe measure to the same effect was called forth by the action of the church. In 1274, the council of Lyons, in accordance with the doctrine of the sinfulness of usury that had been held by Christian teachers since the time of the early fathers (see AQUINAS), ordained that communities, corporations, and individuals should no longer permit foreign usurers to live on their lands. Edward, in obedience to the decree, issued a statute ordering that henceforth no Jew should practise usury in England, and that all who had pledges deposited with them should, after receiving repayment of the money that had been advanced on them, return them to their owners before the following Easter. Permission was granted to the Jews to practise merchandise or live by their labour; but they were to be confined henceforth to the king's towns and were not to be in scot or lot with their fellow-inhabitants, but were to be tallaged by the king separately as his serfs.

III. (1274-90.) The conditions imposed on the Jews by Edward's statute made it impossible for any great number of them to enter on a new calling; since the prohibition which forbade them to be in scot and lot with the other inhabitants of the towns where they lived excluded them from citizenship, and therefore in most cases from membership of the gild-merchant and of such craft-gilds as were in existence at the time. Thus it was impossible for them, except under crushing disadvantages, to carry on a trade or handicraft in a town (see CORPORATIONS OF ARTS AND TRADES; GILDS). If they were to follow any mercantile pursuit at all, their choice was limited to those trades for which membership of a municipal or trade organisation was not necessary. The only such pursuit to which the energies and capital of a large number of men could be suddenly transferred was the wholesale trade in corn, wool, and other agricultural produce, which was carried on by capitalists who seem to have been in the habit of making advances of money to the producer as prepayment for the yield of a yet ungrown harvest. Jews had long had some slight share in trade of this kind; and many of them now took to it on the publication of Edward's statute. But it was open only to those who had command of a fair amount of capital available for speedy transference. There were many English Jews of humble means, of whom, when usury was still allowed, some had begun to keep pawnshops, while others had lent money in small sums to meet the demand caused by the growing tendency towards the commutation of services and rents in kind for payments of money; and these had no resource except to become household servants and day-labourers, if they could find employers, or else to carry on in secret their former dealings. Thus the severe conditions of Edward's statute led to dishonesty; some Jews continued to practise usury, and others were convicted of clipping the coin. Edward attempted to mitigate the difficulties that his first measure had caused, by issuing an amended statute which allowed usury in a modified form. But the attempt

never had a fair trial. The church, alarmed at the influence that the Jewish faith and rites exercised on Christian heretics, and on conforming Catholics as well, had attempted during the 13th century to restrict the intercourse between believers and Jews; and in 1286, Honorius IV., dissatisfied with the efforts made by the English bishops to enforce the canonical decrees on the subject, issued a special bull to the Archbishops of Canterbury and York and their suffragans, in which he begged them with the greatest urgency to use every possible means by which the intercourse might be lessened (Baronii, *Annales Ecclesiastici*, sub anno). If such advice was to be carried out, it was impossible for the Jews to work their way into trades and handicrafts; and usury being now forbidden, the bull was therefore practically an appeal for the expulsion of the Jews. A king of Edward's piety could not disregard the wishes of the pope.

But there were two causes which rendered it now an easy sacrifice for a king of England to give up the Jews. First, they had lost immensely in wealth during the period from the outbreak of the civil war till 1290. Their tallage alone at one period of the 13th century had, as has been said above, amounted to £5000 annually; but in 1271, the annual value of the Jewry was estimated by the king at only 2000 marks (Rymer, *Fœdera*, i. 489); and the records of the reign of Edward I., show that in some years the contribution of the Jews was only a few hundred pounds (Public Record Office, *Exchequer of Receipt, Jews' Rolls*). Secondly, there had grown up in their place a new set of royally-favoured money-lenders, the Italian merchants, who were the greatest financial and commercial power in Europe, and whose vast resources were always at Edward's service in time of need.

Edward therefore could yield speedy obedience to the desire of the pope. He was in Gascony when the bull reached England, but before his return he expelled the Jews of the province; and in 1290, a year after his return, he issued a decree, ordering all Jews under pain of death to leave England. The whole community, numbering 16,000, departed from the country in the same year. They were allowed to take away their movable property with them, but their debts and houses fell into the hands of the king.

For two centuries the decree forbidding Jews to live in England was, in all probability, completely effective. The one known fact to the contrary is, that in 1410, a French Jew, a physician, was allowed to come to England, to remain here for two years, and during that time to practise his profession in any part of the realm (Rymer's *Fœdera*, 2nd ed., viii. 667). But in 1492, when the great expulsion of the Jews of Spain took place, some of the refugees sought a home in England. They were not money-lenders, like the mediæval Jews who had been expelled from England, but merchants engaged in foreign trade. The little community thus founded has continued to exist and to grow till the present day. For two centuries it was not recognised by the law, but in 1656, a commission appointed by Cromwell to consider the legality of the presence of Jews in England, reported that "the Jews deserving it may be admitted into this nation to trade and traffic and dwell amongst us as Providence shall give occasion." From that time, the Jews were recognised as English subjects, not distinguished in the eyes of the law from other Englishmen, except by certain political and other disabilities, nearly all of which attached equally to Roman Catholics, and have now been removed. Perhaps the only one remaining is their ineligibility to the office of Lord Chancellor.

[An admirable and almost complete bibliography of the subject is given by J. Jacobs and L. Woolf, *Bibliotheca Anglo-Judaica*, London, 1888, 8vo, pp. xiii-xix, and 1-35. The most comprehensive histories and collections of documents are:—J. Jacobs, *The Jews of Angevin England*, London, 1893.—S. Goldschmidt, *Geschichte der Juden in England, XI. und XII. Jahrhundert*, Berlin, 1886.—D. B. Tovey, *Anglia Judaica*, Oxford, 1738.—W. Prynne, *A Short Demurrer against the Jews' long-discontinued Remitter into England*, London, 1656.—A Gentleman of Lincoln's Inn (P. Abrahams, on the expulsion of the Jews from England, in *Jewish Quarterly Review*, vol. vii., Nos. 25, 26, 27.]

B. L. A.

JEWS, EXCHEQUER OF THE. It has been mentioned in the preceding article that in 1194 there were appointed by Richard I. special officers for the affairs of the Jews, viz.—local staffs of clerks and registrars to supervise Jewish business in those towns where it was allowed to be transacted, and to keep counterparts of Jewish bonds, and in addition proctors or judges to deal with cases in which Jews were concerned. The local officers remained, during the residence of the Jews in England, in the position to which they were originally appointed. But the proctors acquired powers and duties which made them, like the barons of the exchequer, the heads of a judicial and administrative system. In the 13th century, they were known no longer as "proctors," but sometimes as "Justiciars deputed to the charge of the Jews" (*Justiciarii ad custodiam Judæorum assignati*), sometimes as "guardians of the Jews" (*custodes Judæorum*),

sometimes, with reference to the fact that they presided over the exchequer chamber set apart for Jewish revenue and accounts, as "Justiciars of the Exchequer of the Jewry" (*Justiciarii ad Scaccarium Judaismi*).

In their judicial capacity they tried nearly all the Jews that were charged with any offence for which a non-Jew would have had to appear before one of the king's ordinary justices; they also decided civil suits between Jew and Jew, and between Jew and Christian. At the king's order they could set aside, or modify, contracts to which Jews were parties. But arbitrary action of this kind was exceptional; as a rule they administered the special system of law that had grown up, partly from the recognition of Jewish custom, and partly from the action of kings who issued charters, writs, and statutes defining the duties, position, and privileges of Jews. The only other officers who had jurisdiction over Jews in England were the constables of certain royal castles, the chancellor of the university of Oxford, and the judges who were sometimes exceptionally appointed to try heinous charges such as those of child murder and of clipping the coin.

In their fiscal capacity the justices of the Jews were the responsible custodians of the Exchequer Chamber of the Jews (*Scaccarium Judaismi*), its great seal, its chests, and its accounts. They had to see that all the claims which the king had against Jews, or which arose out of transactions in which Jews were concerned, should be presented and enforced. For this purpose they provided the sheriff of each county with *extractæ*, or lists of the sums which he was expected to collect as Jewish revenue (*de summonitione scaccarii judaismi*): and, in order that they might have at their disposal the necessary information, they kept records of the king's claims on Jews and their debtors; they heard declarations concerning, and gave their sanction to, changes which were to take place in the ownership of Jewish property, as for example when a Jew having received payment of a debt, gave up his claim on the debtor; they made arrangements for the management and transference of property that came into the king's hands on account of Jewish claims. But, important as were their duties in connection with the Jewish revenue, they did not receive any money except from the barons of the exchequer. The sheriffs, or any other officers who might on special occasions be appointed to make collections from the Jews paid in their money to the great exchequer; thence, except when it went direct to the king's wardrobe, it was transferred to the Exchequer of the Jews; and the justices of the Jews were responsible for having it ready for use by the king when he needed it. As it was collected for the most part in silver, they were sometimes ordered to exchange it for gold, so that it might be in a form more convenient for the king's use. They had to present periodically to the barons of the exchequer an account of their receipts and disbursements.

Nor were their functions wholly judicial and fiscal. Besides interpreting as judges the special acts relating to the Jews, they were responsible as executive officers for their carrying out. At various times they were ordered to see that regulative and restrictive enactments issued by Henry III. and Edward I. were duly observed; they kept lists of all foreign Jews who arrived in England, and they and the king alone had the power to allow a Jew to change his residence from one town to another. In order that they might be able to discharge their executive functions, they were invested with a general authority over the king's "bailiffs and faithful subjects" which enabled them on the one hand to order the seizure of the person, family, and goods of any Jew who failed to pay what he owed the king, and on the other hand to transfer to a Jew the lands pledged as security by a defaulting debtor.

Their status was that of officers of the exchequer, subordinate to the treasurer and barons, by whom they were inducted into office. Thus they enjoyed all the privileges and dignity that belonged to those who were *e gremio scaccarii*: and on the other hand, the barons could, as superior officers, overrule their proceedings, punish them, suspend or expel them from office, and discharge any of their duties. Thus we find the barons conducting scrutinies of the chests containing the deeds of the Jews, taking part in the assessment and enforcement of their tallage, sanctioning the release of their debtors, deciding their disputes, and giving directions for the apportionment of their estates; although all these duties naturally belonged to the justices appointed especially for Jewish affairs. This imperfect distribution of duties is not surprising in a branch of the administration which, while it lasted, was dependent to an exceptional degree on the will of the sovereign, and which ceased to exist before it could, like other branches of the administration, be reorganised by the genius of Edward I.

It remains to be added that the justices of the Jews appear to have varied in number at different times from two to five, and were, in the 13th century at any rate, without exception Christians; whereas their subordinate staff, made up of clerks, escheators, bailiffs, presbyter, and keepers of records, regularly included both Jews and Christians. (See KING'S CATTLE.)

Madox, *The History, and Antiquities of the Exchequer of the Kings of England*, ch. vii.—*Papers read at the Anglo-Jewish Historical Exhibition*, London, 1888, pp. 136-230.—J. Jacobs, *Jews of Angevin England*, 1893.] B. L. A.

JEWS, HOUSES FOR CONVERTED. During the residence of the Jews in England before 1290, three institutions were founded, at the royal expense, for the reception, maintenance, and education of converts from Judaism to Christianity. The first, founded by Henry II., was at Bristol; the second, founded by Henry III. in 1232, was in New Street, London, at the southern end of the present Chancery Lane; the third, founded by the same king, probably somewhat later in his reign, was at Oxford. No doubt the two kings were both impelled by the same feeling to found these houses, viz. by the hope that their obedience to the teaching of the church, which bade all Christians help in the conversion of the Jews, would be regarded by the spiritual power as a set-off against the fact that they encouraged Jews to dwell in their kingdom, and shared in the profits of their usury.

Concerning the Houses at Oxford and Bristol, we have no information except as to the authorities which were responsible for their management, the one at Oxford being, as may be conjectured with absolute confidence, under the direction of the Dominican Friars, and the one at Bristol being, as we know from documentary evidence, under the joint direction of the Fraternity of Calenders, the mayor of the town, and the monastery of St. Augustine.

On the other hand the official documents relating to the *Domus Conversorum* of London are numerous, and supply us with information concerning its history over a period which begins with its foundation and does not end till more than three centuries after the expulsion of the Jews from England by Edward I.

At the time of the foundation of the House in 1232, Henry III. made lavish provision for its support. He gave the ground on which it was built, he bore the expenses of building, and made an annual grant of 700 marks from the exchequer as a provision for its officers and inmates until some special source of revenue should have been set aside for the purpose. Three years later he granted to the House, no doubt in substitution for the annual payment from the exchequer, certain lands and tenements in London, and also such other property in London as should from time to time be escheated. His intention was, according to the account of his contemporary Matthew Paris, that the life of the inmates should resemble that of members of a religious order. The buildings were planned so as to give accommodation similar to that of a monastery; and the converts were to live according to a "rule," a word that is often used to describe the ordinances of a monastic order, and were to regard the *Domus* as a lifelong home where they might dwell without the need of servile labour or the practice of usury, and might study the Christian law under competent teachers.

The attempt to maintain the religious character of the house was kept up during the pre-expulsion period. There were always a clerical warden, and two or more resident clerics besides, who were charged with the duty of instructing the inmates and celebrating religious services on their behalf. Indeed, Edward I., in his endeavour to encourage the converts in the study and practice of Christianity, went so far as to command that the warden should in the appointment of chaplains, give the preference to such converted Jews as should show themselves to be fit for the post.

The supply of money for the support of the house was less constant, and was affected by the fluctuations in the king's Jewish revenue. Throughout the reign of Henry III. the early endowments were undisturbed and provided a sufficient income. But Edward I., who was heavily in debt at his accession, seems to have resumed possession of the lands and houses which his father had set aside for the support of the converts. In 1280, however, he granted them, in addition to an annual payment from the exchequer, the deodand, the yield of the poll-tax of 3d. a head levied on the Jews, a half of the property of any Jew who should become converted to Christianity, and all the property belonging to Jews that, on account of the misdoings of its owners, or for any other reason, should fall into the king's hands. All these sources yielded, as we know from the still extant accounts rendered by the keeper of the house from 1280 to 1286, an average income of only £108, and did not rise in any year higher than £150. Even this small amount was not to be depended on, as the annual grant of 80 marks from the exchequer was, in 1285, reduced to 40 marks, and was in some years withheld altogether. In 1290 the converts presented a petition bitterly complaining of their poverty, and Edward, into whose hands some Jewish property had fallen at the expulsion, answered the petition in 1292 by promising a grant from the exchequer to begin at £202:0:4 yearly, and to be reduced, whenever any convert then in the house should die, by the amount of the saving that would thus be effected. The greater part of the grant was spent in the payment of the allowance made to the converts, each of the forty-four men receiving tenpence weekly, and each of the fifty-three women eightpence. The rest of the money went to pay the salaries of the warden, chaplains, and clerk, and the cost of repairs of the building. By 1308 the inmates were reduced to seventeen men and seventeen women, and the annual grant to £120. The exchequer still neglected to issue the money regularly, and the converts frequently complained that their pay was years in arrears and that they were half-starved. Nevertheless new inmates,

foreigners of course, entered the house from time to time, the latest date at which their presence can be traced being 1610.

The office of warden of the House, which was annexed by Edward III. to that of keeper of the rolls, was, down to the time of Lord Lyndhurst, filled by the masters of the rolls who lived, by virtue of their position, in the house that was built on the site of the original *Domus*.

[The printed matter that has been consulted for the purpose of the above article is contained in Rymer's *Fœdera.*—*The Rolls of Parliament.*—Madox's *History of the Exchequer.*—*Calendar of Patent Rolls from 1281 to 1292.*—Devon's *Issues of the Exchequer* (Record Commission).—Matthew Paris, *Chronica Majora.*—Toulmin Smith, *English Gilds.*—Anthony Wood, *History and Antiquities of Oxford.*—W. J. Hardy, in *Leisure Hour* for November 1892, on "A bit of old London." In addition, there have been used the Manuscript Calendar, in the possession of the Public Record Office, describing the documents concerning the *Domus Conversorum* that are preserved there, and the accounts of the *Domus* from the eighth to the fifteenth years of Edward I., which are in the Public Record Office and belong to the series "Q. R. Exchequer, Jews." See also *Bibliotheca Anglo-Judaica* (by J. Jacobs and L. Wolf) published in connection with the Anglo-Jewish Historical Exhibition.] B. L. A.

JOBARD, Jean Baptiste Ambroise-Marcelin (1792-1861). A Frenchman by birth, he was sent as surveyor in the Netherlands during the French dominion, and was naturalised after the events of 1815. He soon afterwards started a large lithographic establishment in Brussels, which was ruined by the revolution of 1830, then took to journalism, and was appointed in 1841 director of the Belgian *Musée de l'Industrie*. In this capacity he started the *Bulletin* of the *Musée*.

Jobard had always been passionately interested in technology, social reform, and patents and copyright. Being himself an inventor and a strenuous upholder of the maintenance of copyright, he published, in order to defend his views, besides numerous pamphlets on this question, his *Nouvelle Économie Sociale ou Monautopole industriel, artistique, commercial, et littéraire*, Paris, 1844; and later on his *Organon de la Propriété Intellectuelle*, Paris and Brussels, 1851. This gives the substance of the former work in a condensed form.

His claim in favour of unlimited copyright was criticised by M. Coquelin in the old *Dictionnaire d'Économie Politique*, vol. i., article *Brevets d'Invention*, but has been upheld since by M. de Molinari in the *Journal des Économistes*, xxx., p. 177. He also wrote a *Rapport sur l'Exposition de l'Industrie française en 1839* (2 vols., Brussels and Paris, 1841-42); several *Voyages Industriels* through different countries; and in 1849 a notice on *Brevets de Priorité* (patents for priority), written with the assistance of leading Belgian manufacturers.

JOBBER. On the stock exchange a jobber was originally regarded as a kind of professional speculator, but, by degrees, the term has come to be applied to the professional dealers who stand on the stock exchange and "make a market" for the special securities to which they give attention. The verb "to job" probably proceeded originally from the practice by speculators of buying small quantities or "jobbets" of stock or shares. The national debt would be too large a morsel for anybody to buy or sell, but it is within the powers of any capitalist to job to a small extent in consols. For a description of the jobber in his later phase we may refer back to the heading Dealer. A. E.

JOE (see Johannes), was a nickname derived from *Johannes*, but applied in the West Indies and American colonies throughout the 18th century to the *Double Johannes* or *Dobra*. A "broad joe" was of course a perfect dobra, as opposed to the clipped and sweated specimens which rapidly became common. C. A. H.

JOHANNES, familiarly spelt *Joannese* by English contemporaries, was the Portuguese gold coin which was first minted in 1722 to take the place of the Moidore series of coins. It took its name from the reigning king, John V. It represented 6400 reis or a half-dobra, and in weight half a Portuguese *onça* of gold of twenty-two carats fine.

Its interest to the English is due to the prominent position which it occupied down to 1800 in the currency systems of the West Indian colonies, then the most important of our possessions. But there and in America, by a very natural error, the coin was known as the "half-joe," and the term "joe" was reserved for the full dobra—a coin rather on a par with the doubloon of Spain. The uniform fineness which led to the rapid popularity of "joes," also encouraged the sweating and clipping of which they were the victims, as well as a considerable manufacture of counterfeit "joes" in Birmingham about the end of the last century. In 1821 a change was made in their value, and in 1835 they were displaced in Portugal, the loss of Brazil having affected the demand for Portuguese gold.

The value of the joannese in English money, in 1831, is given as 35s. 11·98d., and that of the half-joannese (which is not the half-joe, as above explained) at 17s. 11·56d. [Kelly's *Cambist*, *passim*, and Chalmers's *Colonial Currency*, p. 396; Eckfeldt and Dubois, *Manual of Gold and Silver Coins.*] C. A. H.

JOHNSON, Samuel (1709-1784). The great lexicographer occupies an interesting place in the history of economics in England. His formal contributions to the subject were few; indeed it may be said that the preface to Rolt's *Dictionary of Commerce* (1761) and his *Considerations on Commerce* (1766) were all that he wrote on the subject. But his opinions

were freely expressed in conversation, and reflect an interesting phase of thought. A man of strong common sense, he had read LOCKE (*Life*, iv. p. 105), PETTY (*ib.* i. p. 440) and many other classical English writers; he may be regarded on the whole as putting forth the views of the ordinary educated Englishmen of the time preceding the publication of the *Wealth of Nations*. He fills this position more distinctly, as he was not carried away by the burst of enthusiasm which followed the appearance of Adam Smith's book. His general attitude on the subject of commerce is summed up in his own words, "As to mere wealth, that is to say, money, it is clear that one nation or one individual cannot increase its store but by making another poorer; but trade procures what is more valuable, the reciprocation of the peculiar advantages of different countries" (ii. p. 430, also p. 98). But though inclined to regard traders as engaged in trying to make their gains at the expense of each other, he distinguished their occupation from gambling on account of its indirect effects (ii. p. 176), and held English merchants in high repute (i. p. 491 n.).

He was also a shrewd observer, and Boswell has put on record many of his remarks on topics of interest. He saw the advantages which accrue from the intervention of middlemen (see MIDDLEMAN, ii. p. 426). He expressed the strongest opinions in regard to the American planters, and may be regarded as one of the precursors of the anti-slavery agitation (ii. p. 27), but he was not a sentimental philanthropist in English affairs, and deprecated the raising of wages of day-labourers as more likely to induce idleness than to raise the standard of comfort (iv. p. 176). He made some interesting remarks on the increase of population, and called attention to the positive checks to its growth (ii. p. 101); but his most valuable suggestions arose from his observations in the Hebrides, on the transition which he there noted from a natural to a moneyed economy (iii. p. 262), and on the effects of this change on social institutions; natural economy has so entirely passed away in the nations which the economist studies most closely, that his remarks upon it possess a special interest.

[*Life of Johnson*, and *Journal of Tour*, ed. by Dr. G. Birkbeck Hill, to which ed. the pages cited refer. The editor's app. to vol. ii. shows Johnson's views on the slave-trade. For A. Smith's opinion of him see John Rae, *Life of A. Smith*. For Johnson's on A. Smith, see Boswell's *Life*. Johnson's pamphlet, *Taxation no Tyranny*, etc., 1775, scarcely deals with economics.] W. C.

JOINT DEBTORS. When several persons are jointly liable to the same debt or demand, each is liable for the whole debt, but they must, as a rule, be sued together during their joint lives, and a voluntary release to one of them will discharge them all. In the case of an order of discharge in bankruptcy, however, persons who are jointly bound with the discharged bankrupt remain liable (Bankruptcy Act 1883, § 30 [4]). If one of several joint contractors interrupts the operation of the Statute of Limitations (see LIMITATION, STAT. OF), by a written acknowledgment of the debt, the other debtors do not lose the benefit of the statute, but he can be sued alone (9 Geo. IV. c. 14, §§ 1 and 2).

The above-mentioned rule that joint debtors must generally be sued together, and that the voluntary release of one discharges them all, constitutes one of the differences between joint liability and "joint and several liability," but the most characteristic difference consists in the fact that the estate of one of several joint debtors is discharged by his death, if any of the co-debtors survive, whilst the estate of a person jointly and severally liable remains liable after his death.

The contractual liabilities of a partnership are in England and Ireland joint liabilities, but the estate of a deceased partner is liable for debts and obligations incurred whilst he was a partner, subject however to the prior payment of his private debts (Partnership Act 1890, § 9). For wrongful acts or omissions partners are, on the other hand, liable jointly and severally (*ib.* §§ 10-12). In Scotland partners are liable jointly and severally for all debts of the partnership (*ib.* §§ 9-12). E. S.

JOINT PRODUCTION — JOINT PRODUCTS. When two or more things are produced by one and the same process, so that the expenses of producing them all together are not greater than the expenses of producing one of them alone would be, then those things are called *joint products:* for example, beef and hides, wheat and straw.

The value of joint—as of single—products is determined by two conditions relating to final and total utility. (1) That the last increment of the producer's outlay should just be compensated by the sum of the prices of the last increments of the products. (2) That the "net advantages" accruing to the producer should be as great as in any other occupation open to him. The value of joint products is regarded by Mill as a[1] "peculiar case," apparently because it varies with the demand for the products; whereas in general he supposes cost of production, and accordingly value, to be unaffected "although the demand should be doubled, trebled, or quadrupled," (Ricardo, ch. xxx.). But with the wider conception of cost of production varying with the quantity produced (Sidgwick, *Pol. Econ.*, bk. ii. ch. 2, § 7; Marshall, *Principles, passim*), this difference between single and joint products disappears.

It is pointed out by Prof. Marshall that the definition of joint products is seldom so

[1] Jevons, *Theory, Pol. Econ.*, 3rd ed. ch. v., points out: "These cases . . . form the general rule," etc.

perfectly realised but that one may be increased without increasing the others. The product then is no longer "joint" with respect to its *marginal* expense.

[Mill, *Pol. Econ.*, bk. iii. ch. xvi.—Marshall, *Principles*, 2nd ed., bk. v. ch. vi. § 5.—Sidgwick, *Pol. Econ.*, bk. ii. ch. ii. § 10.] F. Y. E.

JOINT FAMILY is, according to Hindoo law, a family union of persons, and their wives, descended through males from a common male ancestor, or supposed to be so descended, having a continuous existence like a corporation with its property in common. There is no definite limit to the number of persons who may be members of such a family, or to the closeness of their relationship to one another. Descendants through males from a common male ancestor are presumed to be united in this way. "The strength of the presumption," it has been laid down, "varies in every case. The presumption of union is stronger in the case of brothers than in the case of cousins, and the further you go from the founder of the family, the presumption becomes weaker and weaker." The family remains joint until partition, when each member of the family who has a right to an individual share of the joint estate is in the position of becoming founder of a new joint family. As long as the family is joint and undivided no member of it has any right to a particular portion of the joint property. The proceeds of it belong to the common purse, and are dealt with according to family arrangement; the fact that a person has acquired property for the family does not give him any advantage in respect of the enjoyment of the family property; the most that can be claimed as a legal right by a member of a joint family, so long as it is joint, is maintenance. Whatever is acquired by a member of a joint family belongs to his family not to himself, but to this rule exceptions have been allowed from an early time. Thus, according to the laws of Manu, "property acquired by learning belongs solely to him to whom it was given, likewise the gift of a friend, a present received on marriage, or with the honey mixture"; and again, "what one brother may acquire by his labour without using the patrimony, that acquisition made solely by his own effort he shall not share, unless by his own will, with his brother." The question whether property acquired by a person in commerce can be claimed by his family, or whether it belongs to himself, as having been made *solely* by his own effort, is a frequent subject of litigation in India; the result in many cases, owing to the presumption in favour of joint property, causes great hardship to individual acquirers. The administration of the joint family property is vested in a manager chosen by the family, who is generally the eldest male of the eldest line, he being a competent person. The manager acts as agent of the family within the scope of his powers, not as owner of the family property, like the head of a patriarchal family, from which the joint family is in many cases derived. Important acts relating to the family property require the concurrence of those members of the family who are interested in a partition. There is a great difference between the two schools of Hindoo lawyers, the Mitacshara and Dayabhaga, as to the position of those members of the family who can claim a share by partition. According to the Dayabhaga teaching, which prevails in Bengal, the members of the family are owners of their undivided shares, and the sons take no interest whatever in the family property in the lifetime of their father. According to the Mitacshara, on the other hand, the son immediately on his birth becomes one of the co-owners, and the co-owners hold the family property not as individuals, but as a corporation; no single member having any ownership in it whatever. Thus the share of a co-owner in Bengal is treated as individual property, which may be alienated by him, and made liable for his debts; whilst under the Mitacshara a co-owner has, strictly speaking, nothing which his creditors can seize or which he can alienate. But this strict view of the Mitacshara joint ownership is giving way in some parts of India, and an approach is being made towards individual ownership. There is, of course, no inheritance in a Mitacshara joint family. Any member of a family who is a co-sharer may, according to both schools, claim a partition.

The typical Hindoo joint family is joint in food, worship, and estate, *i.e.* it has a common meal in the common homestead, common religious rites, and common property. The joint family organisation exists with more or less difference of detail in many countries, as in Armenia, Russia, and among the Southern Slaves. It has not been confined to peoples of Aryan origin, as has sometimes been supposed.

[Mayne, *Hindoo Law and Usage*, ch. viii.—De Laveleye, *Primitive Property*, ch. xiii.-xvi.—Maine, *Early Law and Custom*, ch. viii.] E. A. W.

JOINT OWNERSHIP. Property may be held by several persons as tenants-in-common, or as joint tenants. In the former case the share of a deceased tenant is part of his estate, in the latter it accrues to the surviving joint-tenants or tenant. E. S.

JOINT-STOCK COMPANIES. Joint-stock companies are divided into incorporated and unincorporated Companies (*q.v.*), but the latter have ceased to be of any practicable importance. Companies belonging to the first-named description are incorporated by royal charter, or by a special act of parliament, or by registration under the Companies Act. The constitution of companies incorporated by royal charter depends entirely on the provisions of the charter in each case. It is not unusual to provide in

such charters that the members of a company are liable for the debts of the company for an amount exceeding the amount of their respective shares. Railway, canal, dock, and waterwork companies carrying on business in the United Kingdom are always incorporated by special act, but they generally adopt the provisions of the Companies Clauses Act 1845, and are therefore to a great extent governed by uniform regulations. These regulations differ in several material respects from those governing the third class of companies—companies incorporated by registration. Thus, whilst the Companies Acts leave it to the articles of each company to determine the constitution of the managing body, the Companies Clauses Act contains explicit directions as to the appointment, rotation, powers, and proceedings of directors (§§ 81-100). The Companies Acts, with the exception of the act of 1879, which only applies to *banking* companies formed or transformed into limited companies after its date, do not prescribe a compulsory audit of the accounts; on the other hand companies governed by the Companies Clauses Act must have their accounts audited in accordance with the provisions of that statute (§§ 101-108). There is no power either under the Companies Clauses Act or under the Companies Acts to pay dividends out of capital, but whilst a company registered under the last-named statutes is absolutely incapable of sanctioning such payments, the special act of a railway, canal, dock, or waterwork company may authorise them, and the payment of unearned dividends at a fixed rate during the construction of the undertaking is sometimes provided for in this manner. (As to the difference between the debenture-stocks issued by the two respective classes of companies, see DEBENTURE STOCK.)

The most numerous class of joint-stock companies consists of those formed under the Companies Acts. These acts, the principal of which is the Companies Act of 1862, are occasionally referred to as the Limited Liability Acts, an expression which is somewhat misleading, inasmuch as companies with limited liability were in existence for a considerable time before 1862, and the Companies Acts moreover deal with unlimited, as well as with limited companies. Limited companies are subdivided into companies limited by shares and companies limited by guarantee; unlimited companies into such as have a fixed capital, and so-called "mutual companies," which have no fixed capital. The new companies registered since the passing of the Companies Act of 1862 and up to the 31st December 1892 consisted of

39,911 Companies limited by shares.
950 Companies limited by guarantee.
134 Unlimited Companies with a fixed capital.
318 Mutual Companies.

41,313

In 1892 the newly-registered companies consisted of—

2279 Companies limited by shares.
73 Companies limited by guarantee.
3 Unlimited Companies with a fixed capital.
5 Mutual Companies.

2360

It will be seen that the unlimited companies with a fixed capital form only a very small part of the whole number. The mutual companies and those limited by guarantee are somewhat more numerous, but hardly any of the companies registered in either way are trading companies in the strict sense. The usual form of association adopted by trading companies not being railway, canal, dock, or waterwork companies, carrying on business in England, is that of companies limited by shares.

One of the most striking features of the law of the Companies Acts before 1900 was the absence of any restrictive conditions in respect of formation of companies. On the Continent, companies are, as a rule, not incorporated until the whole of the capital has been subscribed (as to Germany, see *Handelsgesetzbuch*, § 209, d, e; as to France, *Loi sur les sociétés*, 24th July 1867, § 24; as to Belgium, *Loi sur les sociétés*, 18th May 1873, § 29; as to Italy, *Codice di Commercio*, § 131) and until a certain portion of it has been paid up (in Germany, 25 per cent, *l.c.* § 210; in France, 25 per cent, *l.c.* § 24 and § 1; in Belgium, 5 per cent, *l.c.* §§ 29, 31; in Italy 30 per cent, *l.c.* § 131). There are also in the law of most continental countries various provisions for securing an inquiry—at the outset—into the circumstances of the promotion of every company. Thus, for instance, in Germany it is the first duty of the directors of a newly-formed company to issue a special report on these matters, and if any of the directors have taken part in the promotion or sold any property of the company, another report must be issued by independent auditors (*l.c.* § 209), and it is also provided that any purchases of property for a sum exceeding one-tenth of the capital of a company made within two years from the incorporation of the company must be approved by the shareholders in general meeting (*l.c.* § 213f.). Since 1900 some safeguards against the creation of bogus companies have been introduced in England. A limited company is incorporated as soon as the MEMORANDUM OF ASSOCIATION (*q.v.*) is filed at the office of the registrar of joint-stock companies, and this can be done before any shares, excepting the seven shares to be subscribed for by the persons who sign the memorandum, have been disposed of; but a company though incorporated is not allowed to commence business before the amount fixed as the minimum capital has been subscribed, and a number

of other specified requirements ensuring the publicity of all incidents connected with the promotion of the company has been complied with.

The principle of "laissez-faire" still pervades the rules as to the management of companies. A company excluding table A by its articles (see ARTICLES OF ASSOCIATION) is almost entirely unfettered in these respects; it may leave the entire management in the hands of one person for life, and though a meeting of the shareholders must be held annually (Companies Act 1862, § 49) it is not necessary, in the absence of directions in the articles, to submit yearly accounts to the shareholders. The foreign codes have elaborate rules on the valuation of assets and the formation of reserve funds (see as to directors and managers of companies in Germany, *l.c.* § 209 f., §§ 224-235; in France, *l.c.* §§ 22, 26, 40, 44; in Belgium, *l.c.* §§ 43-49; in Italy, *l.c.* §§ 139-142, 147-152. As to the confirmation of accounts by general meetings in Germany, *l.c.* §§ 239, 239 b [185 c]; in France, *l.c.* §§ 32, 34; in Belgium, *l.c.* §§ 27, 35; In Italy, *l.c.* § 154. As to the valuation of assets and formation of reserve funds in Germany, *l.c.* § 239 b [185 a, 185 b]; in France, *l.c.* §§ 34, 36; in Belgium, *l.c.* §§ 62-65; in Italy, *l.c.* §§ 176, 182). British company law does not require the assets to be valued periodically, and it is even unnecessary—in the absence of any special regulations in the articles—to provide for the depreciation of wasting property (see Lee *v.* Neuchatel Asphalte Company, 41 Chancery Division, 1; Bolton *v.* Natal Land Company [1892], 2 Chancery, 124; Verner *v.* General Trust [1894], 2 Chancery, 239); dividends cannot be paid except out of profits, but in ascertaining the profits for that purpose, it is not necessary to take into account any decrease, however serious, in the value of a company's property.

Directors, in England as elsewhere, are liable for fraud and for any acts done by them in excess of their powers (see DIRECTORS, LEGAL DUTY OF); but whilst on the Continent they can be made responsible for losses caused by ordinary negligence (see as to Germany, *l.c.* § 241 [2]; as to France, *l.c.* § 44; as to Belgium, *l.c.* §§ 51, 52; as to Italy, §§ 147-149), British directors are safe from all claims as long as they keep within their powers and are not acting for their personal advantage (see Lord Hatherley's remarks in Turquand *v.* Marshall, 4 Chancery Appeals, on p. 386: "However ridiculous and absurd their conduct might seem, it was the misfortune of the company that they chose such unwise directors"). Every English company must—by virtue of Companies Act 1900, § 21—appoint at least one auditor at each annual meeting, not being either a director or officer of the company, and having wide powers as to the inspection of books and vouchers, and every balance-sheet published by a company must be certified by the auditor or auditors so appointed. In France, Belgium, and Italy, independent auditors (*commissaires*, *sindaci*) must be appointed by the shareholders (see as to France, *l.c.* §§ 32-34; as to Belgium, *l.c.* §§ 47, 48, 54, 58; as to Italy, *l.c.* §§ 183-184). Their duties include the inspection of the accounts and securities during the whole of the year for which they are elected, and they may convene general meetings of the shareholders in case of necessity. A peculiarity of British—as distinguished from foreign—companies is their power to issue debentures, the holders of which in case of a winding-up may take possession of the whole undertaking (see DEBENTURE). The hardship to ordinary creditors produced by this possibility is now considerably mitigated by Companies Act 1900, § 14, which provides for the compulsory registration of all mortgages and charges created for the purpose of securing any issue of debentures.

In one way, shareholders in British companies are better protected than those in foreign companies. On the Continent the officers of a company have unlimited powers to bind the company, while in England engagements entered into beyond the powers defined by the memorandum and articles are of no effect (see ULTRA VIRES, DOCTRINE OF).

The question as to the relative advantages of the respective tendencies of British and continental company law is not easily answered. There is no doubt that the great majority of the more important companies in the United Kingdom have hitherto been managed honestly and prudently: gross instances of fraud and recklessness occur from time to time, but it is by no means certain whether, under the stringent regulations of continental law, such occurrences are less frequent.

The law should allow full scope to the great variety of objects for which companies are created, as inelastic rules as to the conditions of incorporation and internal organisation may stifle legitimate enterprise. This has been shown in Germany, where the stringency of the provisions enacted in 1884 has—already in 1892—made it necessary to introduce a new kind of mercantile associations, *Gesellschaften mit beschränkter Haftung* (Partnerships with Limited Liability), which are not subject to the restrictions of company law.

The chief fault of English company law is the unsatisfactory nature of the rules as to the liabilities of directors. As the law stands, a director who does not take any active part in the proceedings of the board is almost free from responsibility (see, for instance, Cullerne *v.* London and Suburban Building Society, 25 Queen's Bench Division, 485); and the frequent practice of directors, of leaving everything in

the hands of one or two "active" colleagues, is actually encouraged by the decisions of the courts.

The habitual disinclination of shareholders to ascertain whether unusually high dividends have been earned in a legitimate way is a frequent cause of disaster, which cannot, however, be dealt with by legislation.

The disasters of the "Liberator group," and of a number of so-called "trust companies," have attracted the attention of the public to the deficiencies of English company law, which are also pointed out in a very interesting report issued by the board of trade, pursuant to § 29 of the Winding-up Act 1890 (Third Annual Report, 1894, pp. 305); new legislation is recommended in the same for the purpose of securing the following among other objects. (1) The compliance with definite requirements as to subscription and payment of capital; (2) the disclosure of fuller information in prospectuses; (3) the securing of a substantial interest in the company on the part of its first subscribers; (4) the prevention of fraud by the sale of insolvent undertakings; (5) the limitation of borrowing and mortgaging powers and fuller disclosure of mortgages; (6) more efficient audit and fuller publication of balance-sheets, etc. A departmental committee, consisting of Lord Davey as chairman, and a number of theoretical and practical experts in company law, was constituted for the purpose of considering these proposals, and the Companies Act 1900 is the result of their deliberations.

Another departmental committee constituted in 1905 for the purpose of considering further improvements of the law has not as yet issued a report.

The increasing amount of business carried on through the medium of limited companies renders it more imperative that the supervision of these companies should be thorough and exact. The business carried on by these companies is very varied in nature, from millinery shops carried on by ladies struggling to make a scanty income, to large shipping companies whose liabilities reach immense sums: the whole subject of the regulation of these concerns requires the careful attention of our highest legal authorities. The annual reports of the board of trade under § 131 of the Bankruptcy Act 1883 disclose many instances of dishonesty through which innocent and ignorant persons are frequently robbed of large sums.

[As to the law of joint-stock companies incorporated under special acts, see Hodges on *Railways;* Brown and Theobald on *Railways*. As to the law of companies incorporated under the Companies Acts, see Palmer, *Company Law;* Buckley on *The Companies Acts*. A more popular exposition is contained in Hamilton: *A Manual of Company Law for the use of Directors and Promoters*. Statistics relating to companies registered under the Companies Acts are contained in the annual returns of the registrar of joint-stock companies; see also the articles on COMPANIES.] E. S.

JOINT TENANCY. Where two or more persons have an estate given to them as joint tenants, they hold it jointly, so that on the death of one, the whole estate belongs to the survivors or survivor; whilst if the estate or property is given to them as "tenants in common," the share of a deceased tenant goes to his heir in the case of real property, and to his personal representative in the case of personal property. Trustees are usually made joint tenants.

[Goodeve's *Real Property*, 3rd ed. 1897.] J. E. C. M.

JOINTURE. A jointure was an estate in freehold land given to a wife to take effect on the death of her husband, so called because in former days the estate was given in joint tenancy or jointure to both husband and wife. In modern times, provision is made for the wife by charging the lands of the husband with the payment of a yearly sum.

[Goodeve's *Real Property*, 3rd ed. 1897.] J. E. C. M.

JONES, DAVID (1806-1854), Actuary of the Universal Life Assurance Office. Very favourably held in estimation as the author of a book *On the Value of Annuities and Reversionary Payments*, with numerous tables. To which is appended a treatise on "Probability," by Sir William Lubbock, Bart., F.R.S., and J. E. Drinkwater Bethune, A.M., 2 vols., 8vo, London, 1844, published by the Society for the Diffusion of Useful Knowledge (pp. xxx. and 1136, with 64 pages comprising the treatise referred to). This work, which has become scarce, continues to be appreciated as one of the most useful guides, from a practical point of view, for the solution of the many problems that require accurate solution in the business of life assurances and annuities. The former are included in Jones's work under the designation of reversionary payments.

A translation into German appeared in 1859, at Hanover. Jones, David, *Leibrenten und Lebens-Versicherungen*, Deutsch bearbeitet und mit Tabellen versehen von K. Hattendorf. F. H.

JONES, ERNEST CHARLES (1819-1869), poet, novelist, and politician, was brought up to the bar, but attached himself in 1846, at first as a follower of Feargus O'Connor, to the Chartist movement, of which he was a prominent advocate. Gradually, however, as the importance of the Chartist movement decreased, he became more identified with the extreme radicals. In 1848, he was sentenced to two years' imprisonment, with a fine, for seditious speeches. He was on the staff of the *Northern Star*, the Chartist organ, and afterwards edited *Notes to the People*. He was a brilliant and impres-

sive democratic orator, but his statements are exaggerated.

His writings on economic or political subjects, apart from articles in the organs above mentioned, are all reprints of lectures, and include — *Evenings with the People*, 1856-57.—*Labour and Capital*, 1867.—*Democracy vindicated—a Reply to Professor Blackie*, 1867.

[R. G. Gammage, *History of the Chartist Movement*, 1854 (this author is very severe on Jones, with whom he was constantly at strife).—*The Times*, 27th January, etc., 1869.] R. H. H.

JONES, RICHARD (1790-1855), son of an eminent solicitor, was born at Tunbridge Wells. At the age of twenty-two he entered Cambridge, where the society of Herschel, Whewell, and other future savants is said to have fostered in him the love of positive inductive knowledge. After leaving Cambridge he took orders, and was curate for several years in Kent and Sussex. Meanwhile he was composing his first and principal work, *An Essay on the Distribution of Wealth, and on the Sources of Taxation*, of which the first division, or "book," on rent, —not destined to have a sequel—was published in 1831. Soon afterwards Jones was appointed professor of political economy in the newly-established King's College, London; where he delivered an introductory lecture in 1833. From King's College he was transferred to Haileybury, as the successor of Malthus. He occupied the chair of political economy and history at Haileybury for several years; but his academic pursuits, and the completion of his projected work, were interrupted by the active part which he took in the commutation of tithes. He showed great practical ability as tithe commissioner, an office which he held till 1851. He was afterwards a charity commissioner.

The rôle of Jones in political economy was like that of Bacon in physical science: to preach the importance of experience, and the danger of hasty generalisation.

"If we wish to make ourselves acquainted with the economy and arrangements by which the different nations of the earth produce or distribute their revenues, I really know of but one way to attain our object, and that is to look and see" ("Introductory lecture at King's College," *Literary Remains*, p. 569).

"To complete the knowledge really and securely attainable . . . will still require the patient and assiduous observation and labour of many minds. . . . During this process the too hasty erection of whole systems, a frail thirst for the premature exhibition of commanding generalities, will probably continue to be the sources of error most to be guarded against" (Preface to *Essay on Distribution of Wealth*, p. 39).

Aristotle's method was not more objectionable to Bacon than Ricardo's was to Jones.

"Mr. Ricardo was a man of talent, and he produced a system very ingeniously combined of purely hypothetical truths; which, however, a single comprehensive glance at the world, as it actually exists, is sufficient to show to be utterly inconsistent with the past and present condition of mankind (*ib.* p. 7)."

Like Bacon, Jones did not illustrate his new method by any very remarkable discoveries. The following are specimens. Jones contends that the Ricardian theory of rent does not apply to the payments made to the owners of the soil over the greater part of the world. He disputes what is now called the law of diminishing returns, "the opinion that the powers of agricultural capital necessarily decrease as the quantity employed increases" (*Essay*, p. 197); regarding it as invalidated by "improvements in the arts of production" (*ib.* p. 199). He denies that a fall in the rate of profits is always attended with a diminution of savings (*Literary Remains*, p. 371). All these propositions are admitted by moderate followers of Ricardo, by J. S. Mill for example. However, against some of the narrower Epigoni, some of Jones's strictures (*e.g.*, *Essay*, p. 182) may be justified.

Accordingly it may be regretted that Jones's criticisms were not more favourably received by his contemporaries—M'Culloch, for instance, hardly thinks him worth notice (*Literature of Political Economy*). For the reaction against over-generalisation, if headed by Jones, would have come sooner, and would have been more moderate, inasmuch as Jones did not abjure the use of deductive reasoning within certain limits, *e.g.* with respect to farmers'—as distinguished from peasants'—rents.

Thus his demonstration of the propositions that the rise of rents from the employment of any given quantity of auxiliary capital will be less than that which would take place from the employment of an equal amount of capital in the maintenance of additional labour (*Essay*, p. 225), and that "a rise in the relative value of raw produce . . . will always be followed by a decrease of the share of the producing classes . . . and by a corresponding rise in the produce rents of the landlords" (*ib.* p. 245) is highly abstract.

His formula that the interests of the landlords are indissolubly connected with those of their tenantry and the community at large is just as liable to misconstruction as the converse Ricardian paradox which he combats. In short, as Gibbon said of a more important protest, "we shall rather be surprised by the timidity, than scandalised by the freedom," of the reformer.

A similar moderation characterises Jones's contributions to economic history, of which the best specimen is the "Essay on Primitive Political Economy," forming an article in the *Edinburgh Review* for April 1847 (reprinted in the *Literary Remains*, p. 291). The writer looks at past events in the light of modern theory. He has not reached that pitch of

culture from which all the truths of political economy appear only "relative" to the circumstances of the age. He roundly takes our ancestors to task for their "delusions" (*ibid.*), and, in terms calculated to shock the delicate historical sense of the present day, exhibits "the errors and wanderings of our forefathers" (Introductory Lecture, *Literary Remains*, p. 541). He presented clear general views, such as the distinction between the "balance of bargain," and the "balance of trade," without parading obscure authorities. He was a philosophic historian, and not a mere chronicler. He deserves to be regarded as the founder of the English historical school.

An Essay on the Distribution of Wealth, and on the Sources of Taxation, pt. i., Rent [no more published], 1831.—An introductory lecture on Political Economy, delivered at King's College, with a syllabus of a course of lectures on the Wages of Labour (reprinted in *Literary Remains*), 1833.—A few remarks on the proposed commutation of tithes, with suggestions of some additional facilities, 1833.—Remarks on the manner in which tithes should be assessed to the poor's rate under the existing law, with a protest against the change which will be produced in that law by a bill introduced into the House of Commons by Mr. Shaw Lefevre, 1838.—[The impression of a "full man" which Jones's writings convey is confirmed by the genial picture of his personality which Miss Edgeworth gives in her (unpublished) memoirs (vol. iii. p. 55): "Such crowds of ideas as he poured forth, uttering so rapidly as to keep one quite on the stretch not to miss any of the good things."]—A very unfavourable review, in which the hand of M'Culloch may be traced, in the *Edinburgh Review* for 1831 (vol. liv.), disputes many of Jones's facts as well as all his theory. Whewell, in his Preface to the *Literary Remains*, makes a rejoinder.—A letter to the Right Honourable Sir Robt. Peel on the bill introduced into Parliament by the Attorney-General to exempt all persons from being assessed as inhabitants to parochial rates, 1840.—Textbook of lectures on the Political Economy of nations, delivered at the East India College, Haileybury, 1852 [republished among the *Literary Remains*].—*Literary Remains*, consisting of lectures and tracts on Political Economy. Edited with a prefatory notice by the Rev. William Whewell, D.D. F. Y. E.

JOURDAN, Alfred (1825-1892), dean of the faculty of law at Aix in Provence, and professor of political economy at Aix and Marseilles, was also a frequent contributor to the *Revue d'Économie Politique*.

Besides several writings on law, Jourdan published a *Cours Analytique d'Économie Politique*, eds. 1882, 1890.—*Du Rôle de l'État dans l'Ordre Économique ou Économie Politique et Socialisme*, 1882. "The law of the historical development of the economic mission of the state is to abstain more and more from direct *tutela*, such as technical regulations, but to contribute more and more towards the improvement and increase of the social machinery put at the disposal of emancipated human industry," p. 395. He also wrote *Des Rapports entre le Droit et l'Économie Politique ou Philosophie Comparée du Droit et de l'Économie Politique*, 1888. "Both sciences are based on the same primordial facts; the instinct of social aggregation and human liberty. Political economy traces the motive principle—the necessity of satisfying human wants with the smallest possible amount of exertion; but it is only directly concerned with material interests; whilst law has a more extended territory. For both, progress has always been realised through liberty, namely, the removal of certain trammels." The author's conclusion is: "Ethics and economics stand, as sciences, in the same relation to the science of law as natural philosophy and chemistry to the science of mechanics." The two latter works were rewarded with a prize by the French Academy of Political and Moral Sciences. E. Ca.

JOURNEY (*Mint*). A word used in the Mint to represent a certain weight of gold or silver coin, originally supposed to represent a day's work, and which had to be delivered by the coiners at the end of each "journée" or day. A "journey-weight" of gold is 180 oz. troy, and of silver 720 oz. troy. F. E. A.

JOURNEYMAN, a term originally denoting a labourer working by the day (*journée*), came in England to be applied, before the end of the middle ages, to all craftsmen working for hire, as distinguished, on the one side, from the "masters," "craft-holders," or "shop-holders" who employed them, and, on the other, from the apprentices. In the 14th century, however, the journeyman was also commonly distinguished from the "serving-man," "valet," or "yeoman," who was engaged for a considerably longer period. We may perhaps see in the supersession of these other terms by "journeyman," an indication that with the growth of industry it became increasingly exceptional to contract for a long period of service. Such a contract, it must be added, would become less advantageous to the employer when once the system of apprenticeship had been definitely established, and he had thus secured a permanent working force of another kind, and it would also naturally tend to disappear before the extension of the practice of piece-work.

In the picture commonly drawn by modern writers of the mediæval "gild-system" in its best period, the position of journeyman is represented as the normal intervening stage between apprenticeship and mastership,—a stage out of which the industrious and skilful journeyman could easily rise after a few years. This picture is perhaps true of some industries—in certain localities—in particular periods; and it has served as a useful standard of comparison wherewith to contrast what have been supposed to be earlier and later conditions. But it is difficult to reconcile with the historical evidence. Even as late as the 14th and 15th

centuries apprenticeship was only slowly coming to be a necessary prerequisite of hired labour; and, when it had, full membership of the craft, with the right to set up as an independent master, was already restricted in such a way as to be beyond the reach of the average journeyman. The relation of the journeymen to the GILDS or "crafts" is still somewhat obscure and varied probably from place to place. They were subject to the control of the gild, and their wages were regulated by its officers: in some few cases they appear as taking part in the making of ordinances and even in the election of officers. But as a rule, and certainly towards the end of the 15th century, the masters were alone regarded as in any real sense members or "combrethren" of the craft company.

So long as apprenticeship was enforced, the name of "journeymen" or "free journeymen" continued to be used for those who had served seven years to any art or craft under a lawful "master." It is still in common use in some industries still organised in small shops—*e.g.* that of the bakers; and in others which, like the hatters, have only recently passed into the factory stage, and retain the tradition of earlier conditions.

[The literature of the subject will be found under CORPORATIONS OF ARTS AND TRADES, GILDS, and elsewhere. For a recent summary see Ashley, *Economic History*, part ii. (1893), § 34.—Mrs. Green, *Town Life in the Fifteenth Century* (1894), vol. ii. chs. iv. v., takes up a position which, if hardly supported by sufficient evidence and not altogether clear, is independent and suggestive. The most convenient collection of material will be found in H. T. Riley, *Memorials of London*, 1868.]

W. J. A.

JOURNEYMEN'S SOCIETIES. As soon as there grew up a class of journeymen who realised that they were likely to remain in that position for many years, if not all their lives, and, therefore, that they had class interests to defend, distinct from, or opposed to those of the masters, separate societies of journeymen began to make their appearance. In accordance with the tendency of the later middle ages towards the formation of religious gilds, such societies would seem to have been usually, at first, of a religious character, as is indicated by the names "fraternity," "brotherhood," "confrèrie," and "Bruderschaft." Although in some cases this may have been caused by a desire to avoid condemnation by the public authorities, there is no reason to believe that the journeymen were not moved by the same motives as led other classes to form religious associations. Yet these fraternities would naturally tend to concern themselves with the other interests of their members; and the mere fact of association would lend strength to the journeymen in their negotiations with the masters. The "confrèries" of "compagnons" were a prominent feature in the industrial life of France in the 15th century; their later history still awaits investigation. In Germany "Gesellenverbände" of various kinds were numerous in the 15th century; in some industries they were to be found as late as the present century; and they were the occasion of a long series of imperial and territorial decrees. In England they played a much less important part, partly because industry here was less developed, partly because of the absence of the rule concerning a period of travel, to which may be largely attributed their rapid spread on the continent. Evidence has, however, already been found of their existence in the following London crafts at the dates here stated:—the saddlers, 1383-1396; cordwainers, 1387; tailors, 1413-1696; blacksmiths, 1435; carpenters, 1468; drapers, 1493-1522; ironmongers, 1497-1590; founders, 1508-1579; fishmongers, 1512; clothworkers, 16th century; armourers, 1589; and in the following provincial towns:—Coventry, the weavers, before 1450; Exeter, the tailors, before 1512; Oxford, the shoemakers, 1512; Bristol, the tailors, 1570; and with the further publication of municipal records other instances will doubtless be found. So far as we can judge from our scanty evidence, they seem to have begun as voluntary combinations, in the teeth of the masters and the civic authorities, and to have commonly had among their objects the increase of wages. They were met by strong measures of repression, to which possibly some succumbed, but in many cases they were recognised after a time, sometimes as the result of a formal compromise, and ultimately they sank into a position altogether subordinate to the companies of masters, and became convenient to the latter as a machinery for relieving poor journeymen. Their organisation resembled in general character that of the masters' companies, with periodical assemblies, wardens, contributions, and common-box.

[Our most consecutive information concerns the association among the tailors of London, which under the names of the "fraternity of yeomen," or "valets," "the yeomen fellowship," and, from 1569 onwards, "the bachelors' Company" survived till 1661, when it was suppressed by the Merchant Taylors' Company. Here the development was complicated by the gradual separation between the Merchant Taylors' Company and the industry from which it derived its name. The evidence will be found in C. M. Clode, *Memorials of the Merchant Taylors' Company* (1875), and *Early History of the Merchant Taylors' Company* (1888). But more instructive is the "Ordinance granted by the worshipful masters and wardens, with all the whole company of the craft of blacksmiths of London, to the servants of the said craft" in 1434, which is evidently of the nature of a compact between two bodies, and contains conditions curiously resembling modern trades union policy. It is printed by Mr Coote in *Trans. London and Middlesex Archæol. Soc.* (1874), iv. And almost equally interesting is the indenture between the

shoemakers and their journeymen in Oxford (1512), when the struggle seems to have turned upon the possession of "the box of the journeymen"; this is given in *Records of Oxford* (1880). An attempt is made to present and estimate the value of the information at present accessible in Ashley, *Economic History*, vol. i. pt. ii. (1893), § 35. See however the recent criticism by S. and B. Webb, in *The Hist. of Trade Unionism* (1894), ch. i. For Germany, see G. Schanz, *Gesellenverbände* (1877), and for France, Levasseur, *Histoire des classes Ouvrières*, vols. i. and ii. (1859).] W. J. A.

JOVELLANOS, GASPAR MELCHIOR DE (1744-1811), had a most chequered existence. He was originally public prosecutor in Seville, then in high favour at the court of Madrid, where he became a member of the *Sociedad Económica* and of the *Academia de Historia*; but he fell into disgrace after the accession of Charles IV., was exiled to Gijon, his native place, then recalled to the court and appointed a minister, to be imprisoned again in 1801, first in a convent and then in a fortress in the Balearic islands. Released at the time of the French invasion, he rejected the offers of Napoleon, was made a member of the *Junta Central* of government, and took a leading part in the debates on the Spanish constitution put forward in Cadiz.

On his tombstone in Gijon he is described as having been "a magistrate, a minister, a father of his country, a man of letters, an orator, a poet, a jurisconsult, a philosopher, an economist, —always distinguished, often eminent."

His works, exclusive of his *Memoirs*, which have been printed separately in Paris (1825), have been republished in Rivadeneyra's *Biblioteca de Autores Españoles* (Madrid, 2 vols. 1858-59); the economic writings are to be found in vol. ii. The most important are the *Informe á la Junta General de Comercio sobre la Libertad de las Artes* (1785) (Report on the liberty of the crafts), and the *Informe de la Sociedad Económica al Real Consejo de Castilla sobre el expediente de la Ley Agraria* (1794) (Report on Agrarian Reform). In both, Jovellanos starts from extremely liberal principles, but sometimes restricts them in their final application. Thus, he is strongly opposed to the existing *gremios* or craft-gilds, charging them with oppressing the artisans (p. 37) and inability to adjust supply to demand (p. 38), but although proposing their abolition, he demands a "general immatriculation (enrolment) of all persons connected with a craft, whether as masters, artisans, or apprentices," in order to submit them to the guidance of "*síndicos*" belonging to the craft, but appointed by the local authorities. No free association of people belonging to a craft is to be allowed (p. 41). In his *Informe sobre la Ley Agraria*, Jovellanos inveighs against the existence of *baldíos* (waste-lands), *tierras concejiles* (communal property), and *mayorazgos* (entails), against the extent of land owned in clerical mortmain, and against the privileges of the MESTA granted to the owners of the migrating flocks. He advocates the inclosure of common fields, and proposes to legalise the sale of all such land to the peasants in their vicinity. He urges that more roads and canals should be constructed as well as more works of irrigation. Internal trade in corn should be free, but "in our present situation, free export of corn, either absolute or restrained according to prices, is not necessary and would not be useful" (p. 116). Even the import of corn is only to be allowed temporarily, and should be suspended in years of acknowledged abundance. E. Ca.

JOYCE, JEREMIAH (1763-1816), was a Unitarian minister, and tutor to the sons of Lord Stanhope. Early in 1794, he was imprisoned on a charge of high treason, but at the end of six months released without trial. He remained, until his death, secretary of the Unitarian Society and minister of the Unitarian Chapel at Hampstead. In 1797, he published an analysis or rather abridgment of Adam Smith's *Wealth of Nations*. His annotations are not numerous, but have an interest as reflecting affairs of his day. They refer chiefly to Smith's proposals for obtaining a revenue from the taxation of the colonies,—among which "America," writes Joyce, "the grand, principal resource, is *now* entirely and for ever out of the question" (p. 290). Among other things he notices Pitt's proposal to "double the turnpike tolls . . . seizing upon one half of them for the exigencies of the State" (p. 232).

Joyce's publications are very numerous; those that are connected with political economy are—*A complete Analysis . . . of . . . Adam Smith's . . . Wealth of Nations*, 1797, 8vo, 1821, 12mo, 1877, etc., 8vo.—*The Arithmetic of Real Life and Business*, 1809. A. L.

JUDGMENT. A judgment is the decision of the court on one of the main subjects of an action brought before it. A judgment need not necessarily put an end to the action, as it may only deal with part of the claim or not finally adjudge on any part of the claim. If a defendant in an action fails to appear or to plead in accordance with the prescribed rules, judgment "by default" may be obtained against him. In actions in which unliquidated damages are claimed, a defendant is in such a case ordered to pay "the damages to be assessed." This is called an "interlocutory judgment," because a further step, viz. the assessment of the damages, must be taken before the rights of the parties are finally adjusted. In the Chancery Division of the High Court a judgment frequently directs certain inquiries to be made, or certain accounts to be taken. This is done before the chief clerk in chambers, who subsequently issues a certificate as to the result; the action is then brought before the court

"on further consideration," and if no further inquiries are necessary, directions are given for a final judgment declaring the rights of the parties.

A final judgment materially alters the mutual rights of the parties. It enables a successful party to issue execution against the property, and in case of need against the person, of the party whom it affects (see ATTACHMENT; ELEGIT; FIERI FACIAS). If it directs the payment of money it creates a debt more easily enforced, and in most cases less easily barred by the Statute of Limitations (see LIMITATION, STATUTES OF) than the claim in respect of which the action was brought. As between the parties and their successors in title the subject matter of the litigation cannot, after the lapse of the period allowed for an appeal, or after an unsuccessful appeal, be contested again. The latter rule is generally expressed by saying that a judgment creates an "estoppel inter partes," or that the case has become "res judicata."

The Judgments Extension Act of 1868, and the Inferior Courts Judgments Extension Act 1882, render judgments obtained in England, Scotland, and Ireland effectual in any other part of the United Kingdom. The judgments of foreign courts cannot be enforced in England without a fresh action in an English court, but the judgment in such an action must be in favour of the plaintiff unless the defendant can prove that the foreign judgment was obtained by fraud; that the court in which it was obtained had no jurisdiction; or that it violates a vital principle of English public policy. E. S.

JUDGMENT DEBTOR. A person to whom directions have been given by a JUDGMENT (*q.v.*) to pay a sum of money to another person. E. S.

JUDICIAL FACTOR (Scotland). An administrator appointed to an estate by the Court of Session, in the exercise of its equity jurisdiction "*ex nobili officio* of the court."

Factors may be factors *loco tutoris* on children's estates, or *loco absentis*, as where an owner is absent; curators *bonis*, as where the owner has become incapable of managing his own affairs, or upon failure of trustees, or where trustees have been removed on suspicion of misconduct, or generally where there is a risk of the property perishing or being injured or going to waste. The appointment is made upon petition; and the nominee of the petitioner is, if suitable, usually appointed; but the court may recall the appointment, as on his insolvency.

The sheriffs of the counties may appoint judicial factors to estates of not more than £100 a year, all told. Judicial factors are under the supervision and general superintendence of the Accountant of Court. This officer sees that they give due security, and that the funds are properly lodged in bank. He audits their accounts once a year, makes any such requisitions or orders on them as he considers necessary, and reports any failure or misconduct to the Court or, if necessary, to the Lord Advocate for prosecution. He gets information from the banks as to balances, etc., and is the official custodier of bank receipts and vouchers. He makes an annual report of all the estates under his superintendence. The court does not interfere unless the accountant makes an application to it, or unless leave is required to grant abatements of rent, to sink funds in an annuity, or the like. The judicial factor is paid for his time and trouble by a commission, fixed by the Accountant. Under the Judicial Factors Act 1889, § 13, the appointment of a judicial factor has the full force and effect of an assignment or transfer, duly executed, of all property situated or invested in any part of the British dominions, and belonging to or forming part of the estate under his charge; and all debts must be paid or assignments or transfers executed accordingly. A. D.

JUDICIAL RENT, see LAND LEGISLATION, IRISH.

JUNG STILLING, JOHANN HEINRICH (1740-1817). The surname Stilling was derived from the pietist congregation, *Die Stillen im Lande*, the "quiet country people" to which his family belonged. Jung was essentially a self-made man; up to the age of twenty, his time was divided between teaching in village schools and tailoring; through self-exertion and the assistance of friends, he was enabled to study in the university of Strasburg, where he obtained the degree of doctor of medicine; later on he lectured on cameralistic sciences at Kaiserslautern and Marburg, but this did not prevent his attaining a wide celebrity as an operator for cataract. Jung Stilling made a strong personal impression on Goethe (see *Wahrheit und Dichtung*, bk. ix.); during the last twenty years of his life he gave himself entirely up to mystic literature.

As an economic writer, Jung belongs to the philanthropical and eclectic school, with strong absolutistic leanings which flourished in Germany during the second half of the 18th century under the influence of Sonnenfels, and of his theory of the largest possible population. On this last principle, he goes to the extreme of claiming the protection of the police for pregnant unmarried girls, even against their own parents. Land, in his opinion, might be subdivided to the minimum sufficient to supply the subsistence of a family. Jung was opposed to craft monopolies (Gilds), but favourable to the craft system,—this he wants made compulsory: "craft examinations are necessary in order to prevent the manufacturing of rubbish." In matters of national finance he has a predilection for state domains and royal dues. He appears to have learned very little from Adam Smith, but is most of all swayed by his strong religious feelings: nations whose practice is based on purely commercial principles would soon come to destruction; and exclusively selfish commercial aims are as much to be reprobated in nations as in individuals. Excise-duties have the great

disadvantage of being borne by the weakest party in buying and selling.

Jung Stilling's best-known economic works are the *Staatspolizeiwissenschaft* (1788); the *Lehrbuch der Finanzwissenschaft* (1789); and the *Grundlehre der Staatswissenschaft* (1792).

[See Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 552-555; and *Allgem. Deutsche Biographie*.] E. Ca.

JURANDE. This was the name of the elected board which managed the affairs of a trade-gild or corporation in France. Its chief functions were to maintain the interests of the gild, to regulate the terms of admission and the length of apprenticeship, and to issue *lettres de maîtrise* to those who were qualified for full membership. The advantages and disadvantages of these close corporations were the same in France as in England. They gave some security for good workmanship, but they raised the price of most of the commodities which passed through their hands. At last Turgot succeeded in 1776 in extorting from Louis XVI. an edict for their suppression. It is a curious illustration of Adam Smith's close connection with the French economists that the preamble to this edict contains many of the arguments which he advanced in the same year against trade corporations (*W. of N.*, bk. i. ch. x.). Turgot's reform was not lasting. The system of *jurandes* and *maîtrises* was revived after his fall; but they were finally abolished in 1791. R. L.

JURISDICTION. The jurisdiction of English courts does not extend beyond England; in certain cases, however, leave may be given to serve defendants out of the jurisdiction with writs or notice of writs. If the service is properly effected in such a case, judgment may be obtained against a foreign defendant, but such a judgment could not be enforced abroad, except under the sanction of a foreign court.

[Piggott, *Service out of the Jurisdiction.*] E. S.

Jurisdiction, Scotch. In Scotland jurisdiction is not, in principle, assumed, except upon certain established grounds. The general rule is that the "pursuer" must follow the defender's domicile. The domicile, which is considered sufficient to found jurisdiction against the defender, may be his domicile of succession, that which would regulate his status and the succession to his property. But, by custom, forty days' residence in Scotland is held to imply an intention of remaining in the country, and consequently, any person, who has been more than forty days in Scotland, may be cited to appear as a defender, on the strength of that circumstance alone, until the implication is rebutted by his having been forty days absent from the territory of the court. When this has occurred, or when he is not in Scotland at all, jurisdiction over him, if it exists, must be founded upon some other ground; if it can be, he may be cited in his absence. Among grounds which give the court jurisdiction, may be mentioned the subject matter of the action being a question relating to realty in Scotland. The ownership of real property in Scotland is held to give the Scotch courts jurisdiction over the owner, in respect of all matters except status, so that, if he be resident abroad, he can be cited as an absent person at the office of the keeper of edictal citations, Edinburgh, and the action goes on against him. Where the cause of action, whether contract or delict, has arisen within Scotland, then, if along with this the defender have been personally cited in Scotland, the court has jurisdiction. Again, if a foreigner sue in a Scottish court, he is bound to answer any counter claim which has relation to the same matter, or any set-off fairly set against his own suit or claim. And if a stranger have moveable property in Scotland, the fund or effects due or belonging to him, if substantial, and not merely elusory (though this limiting condition does not appear to be very operative), may, after the fashion introduced in Holland in the 16th century, be attached at the suit of the pursuer, by an *arrestum jurisdictionis fundandæ causâ*, which is only loosed on security being found to appear and defend. The effect of this arrestment is to found jurisdiction, except in cases of status, or actions of declarator of rights, or of reduction of writings, but the jurisdiction fails upon the death of the defender. The judgment which may be pronounced is not limited to the value of the article arrested. With the exception of judgments in absence in actions in which jurisdiction has been founded by the last-mentioned means, all judgments of the Court of Session for debt, damages, or expenses may be enforced in England or Ireland, on registering them within twelve months in the books of the high court in England, or of the common pleas in Ireland; after such registration they have the force of judgments of those courts respectively, this power being reciprocal between the three countries.

In Scotch civil cases, but not in criminal, the House of Lords has appellate jurisdiction in respect of all final judgments, and also of interlocutory judgments in which there has been a division of opinion among the judges of the court, or as to which the court has granted leave to appeal.

[Rankine's *Erskine's Principles of the Law of Scotland.*] A. D.

JURISDICTION OF STATE. See International Law.

JUROS (*Spanish term*). Ferdinand and Isabella, and later on the Spanish kings of the house of Austria, were wont to raise money by accepting private loans from their subjects at varying rates of interest, the payment of this and the reimbursement of the capital being assigned on the general revenue. It was specified that the indentures could be held by right of inheritance (*por juro de heredad*), whence the name. These *juros* were a cause of frightful financial mismanagement, especially when at the time of compulsory reductions of interest, those held by the inquisition or ecclesiastical corporations were declared to be privileged. The unprivileged or *Seculares*, as they were called, very often were sold at a ruinous discount to

holders of privileged stock, so that the liabilities of the royal treasuries derived no advantage from these iniquitous proceedings.

[See the article "Juros" in Canga Argüelles, *Diccionario de Hacienda* (London, 1826); ch. vi. of Konrad Haebler's *Wirtschaftliche Blüte Spaniens* (Berlin, 1888); and Colmeiro, *Historia de la Economia Política en España*, ii. pp. 578-581.]

E. Ca.

JURY (ENGLAND). Before the Conquest, one of the means by which an alleged offender was brought to justice was by accusing him in the sheriffs' tourn, the criminal side of the old county court. He was accused by a kind of committee of twelve from among the suitors of the court (public officials, lords of lands, and, from each township, the parish priest, the reeve, and four men), or by a private accuser; or else in the hundred court, by the reeve and four men of the township.

The suitors were properly the judges; and the accused was cleared either by ordeal or by compurgation, *i.e.* witnesses swore that his oath of innocence was true. After the Conquest, he was accused before the justices by the oath of "the body of the country and the lawful knights of the county"; he might clear himself by ordeal, though even then he might have to suffer banishment; but speaking generally, the accusation was equivalent to conviction, because the twelve accusers spoke from their own local knowledge. This was the origin of the present grand jury in England, which consists of such a number, usually twenty-three, of good and lawful men of the county, usually county magistrates, as may supply the necessary twelve accusers. In the course of time the element of local knowledge became less effective, and the ordeal was practically abolished after the Lateran council of 1216, so that there was no means of testing the truth of the accusation; and hence the custom arose of remitting the matter to an inquest. An inquest was a Norman mode of obtaining information for the use of the justices by referring the matter of fact in dispute to persons possessed of the requisite local knowledge. If the persons so referred to testified to the truth of a fact, it was held as proved; but it must be proved by their own oaths. They themselves were the witnesses; and if they knew nothing of the matter, they could not testify. This kind of inquest by a jury of twelve was, after the great assize of Henry II., the regular mode of ascertaining facts relating to rights in land and the like, these being matters well known to the neighbourhood, the vicinity (*vicinetum*) or "venue." If some testified on one side and others on the other, additional witnesses were added until there were twelve in favour of one side or the other; then the inquiry stopped, and the finding of the twelve was their "truth-telling" or *veredictum* or verdict. The jurors, being witnesses, could be individually examined by the justices.

The next stage was that the jurors, in order to prepare their sworn report, collected information in their own way. Persons possessed of particular information were called in to testify: the jurors, on being satisfied that they spoke the truth, on the ground of personal acquaintance with their credibility, adopted their information, and themselves "dared to swear" to it. They thus prepared themselves to give sworn answers to questions as to specific facts; and by the middle of the 15th century they had arrived at a practice of giving general verdicts on the whole matter. The procedure was thus one based on the jurors' personal knowledge, and was one adapted to small neighbourhoods.

In criminal cases the accusers are now represented by the grand jury, who, as it were, from their own local knowledge of the venue, inform the judges what crimes have been committed within their district. They obtain this knowledge by hearing enough evidence to show that there is a *primâ facie* case in support of the indictment or of the presentment by the coroner's jury. If they are satisfied of this, they endorse the bill of indictment "True bill," and it then becomes an indictment, a sworn accusation by the grand jury; if not, they endorse it "No true bill," and the prisoner is discharged, but can be indicted again.

The modern equivalent of the inquest is the jury in civil cases, the petty jury in criminal cases, while the name is retained in the coroner's inquest. In the two former cases the jury consists of twelve jurors whose verdict must be unanimous; in the last it consists of twelve or more, of whom a majority not less than twelve must concur in the verdict. Juries have a right to return any verdict without being subject to being punished at the will of the court. It is only in rare cases that the element of personal knowledge on the part of jurymen now comes into play; in general it is assumed that they have none.

The right to have a civil case tried by a jury is now absolute only in actions of slander, libel, false imprisonment, malicious prosecution, seduction, and breach of promise of marriage. In other actions, trial by jury can only be had on an order of the court, but this, in common-law actions, is never refused if either party applies for it. A special jury can always be had, on proper notice, at the risk, as to the extra expense, of the applicant. When a juryman is withdrawn by the parties with a view to a settlement, or when he falls ill or dies, or when agreement seems hopeless, the jury is discharged, and the case, if it is to go on, must be re-tried before a new jury.

[Stephen, *Hist. of the Criminal Law of England.* —Stubbs, *Constit. Hist.*]

A. D.

JURY (SCOTLAND). The early history of the jury in Scotland is much the same as in England. In criminal cases there is no grand jury; the jury consists of fifteen persons, of whom five must be special jurors; and the verdict is given by a majority. The forms of verdict in use are "guilty," "not guilty," and "not proven." The last operates as a bar to any fresh trial on the same charge: it has the same effect as a plea of *autrefois acquit* in England. It is understood, and is intended by juries, to mean that the jury are not satisfied as to the innocence of the prisoner, but think the crown authorities have not proved his guilt. It seems, however, that this is a comparatively recent interpretation of the verdict, and that

"not proven" formerly differed from "not guilty" only in referring to the charge instead of to the person; the converse verdict being either "proven" or "guilty."

Jurors in Scotland must have £5 a year from land, or personal property over £200 in value: special jurors must have £8 : 6 : 8 from land, occupy a £30 house or possess personal property over £1000 in value. Each party has five challenges, of which not more than two can be challenges of special jurymen. The verdict is delivered by the foreman or "chancellor" *viva voce* unless a written verdict is directed, and he must say whether the verdict is unanimous or by a majority.

In civil cases, trial by inquest was anciently the usual form; but the ecclesiastical courts assumed a much larger jurisdiction in early Scotland than in England; and the session of James I. and the daily council of James IV. superseded jury trials to a still further extent; so that after the institution of the Court of Session, jury trial in civil cases had practically fallen into disuse except in respect of inquests, which the sheriffs of counties were directed by the Scottish chancery to hold, in reference to the ascertainment of heirs, the finding persons to be lunatic, the delimitation of the widow's third in lands, and the partition of property among heirs-portioners. In 1815, however, it was thought by parliament that trial by jury ought to be made more use of in civil cases in Scotland; and a new court, the jury court, was established, to ascertain facts on remit from the other courts. In 1831, this court was, however, absorbed in the Court of Session, which takes jury trials when required. The cases appropriate to jury trials are, to summarise them roughly, actions arising from alleged wrong-doing, where damages and costs are alone sued for, actions against innkeepers, carriers, etc., actions on insurance policies, some shipping cases, and the annulling of deeds and contracts as having been obtained by coercion, etc. But in practice, litigants are found to prefer trials before a judge without a jury. In jury trials issues are usually adjusted and placed, in print, in the hands of the jurymen, so that they may answer the precise questions put to them. Jury trials take place before the Court of Session in Edinburgh, or before the sheriffs in the county towns; sometimes on circuit. Either party may move for a special jury. The verdict must be unanimous, or, after three hours, by a majority; while in case of equal division the jury is discharged after six hours. The parties may agree to take a special verdict at any time; and, in the course of the trial, a juror may be withdrawn.

[Bell's *Dictionary of the Law of Scotland.*—Mackay's *Practice of the Court of Session.*—Macdonald's *Criminal Law of Scotland*,—50 & 51 Vict. c. 35.] A. D.

JUS AD REM: JUS IN RE. Barbarisms purporting to be derived from the Roman law, but which first appeared in the *Brachylogus* and passed into secular jurisprudence from the canon law.

A *jus ad rem* is a right, relating to a thing, enforceable by an action *in personam; e.g.* a right on the part of A to make B deliver up a specific chattel. A *jus in re* is an absolute right to a thing, enforceable by an action *in rem;* the right which an owner has in his own property. A *jus ad rem* is based on an obligation, and is good as against the party bound; a *jus in re* is good as against the world. A. D.

JUS NATURÆ, as understood by the PHYSIOCRATS, is the right which a man has to do that which is beneficial or advantageous to himself. This right he can only make use of by conforming himself to the order of nature and obeying natural laws.

Up to the middle of the 18th century the question of man's natural rights had been much neglected by philosophers, though LOCKE speaks of it (Bonar, *Philos. and Pol. Econ.*, p. 98), and QUESNAY's views, though not original as regards their subordinate propositions, amounted in the sum to an expansion of the ideas of mankind with respect to the due order of society. Personal liberty and proprietorship of the results of his labour are man's primary rights. These would be destroyed if it were not the duty of all men to abstain from invading them. Hence rights and duties are reciprocal and interdependent. But duties are burdens, and therefore in a sense evils. They exist only to exclude greater evils, and so their existence must depend upon their utility. For subsistence, property is requisite, and this implies inequalities among men, as the ability to acquire is not uniform. Again, for food-production the first essential is land, which is best cultivated when it is a permanent possession, and property in land is therefore desirable. Finally, as all men are not willing to respect rights and duties, means for their protection must be provided, and this provision is Government; but government should have no other mission than the protection of the rights of liberty and property, and legislation should be mainly the enunciation of such natural laws as are best calculated to preserve the social order (see GOVERNMENT, ECON. EFFECTS OF).

[F. Quesnay, *Le Droit Naturel* in *Physiocrates*, E. Daire, Paris, 1846.—G. Schelle, *Du Pont de Nemours*, 1888.—J. Bonar, *Philos. and Pol. Econ.* (1893), p. 135 *seq.*] R. H.

JUS NATURALE, JUS GENTIUM, JUS DIVINUM, JUS HUMANUM. In these phrases the term *Jus* is used not in its sense of a particular "right," but in its sense of "principle of right" = *droit, diritto, Recht.* There is no proper English equivalent for it, as the use of "Law" is apt to cause confusion with the meaning of "law" = *lex, loi, legge, Gesetz, i.e.* a definite statute or judicially-enforced custom. Thus English readers may need to be reminded that international "law," a use of the term "law" to which Austin objects, is in other languages not *lex*, but *jus, droit international, Völkerrecht*, etc.

ARISTOTLE had recognised a distinction between "natural" justice (*τὸ φυσικὸν δίκαιον* =*jus naturale*), which is the same at all times and in all places, and "conventional" justice, *τὸ νομικὸν δίκαιον*, which depends on institution and may therefore vary (*Eth. Nic.* v. 7, § 1). The Roman jurists distinguished the *jus civile* of Rome or of any particular state from the *jus gentium* or principles of right commonly recognised among the various nations and tribes known to them, the principles according to which "equity" was administered by the prætors in cases where aliens were concerned. When the Romans came to be influenced by Greek, especially Stoic, philosophy, *jus naturale* came to be used (*e.g.* by Cicero) as an equivalent but more philosophical term for this *jus gentium*. [Maine's view about the *jus gentium* in his *Ancient Law* is corrected in part by H. Nettleship in *Journal of Philology*, vol. xiii. p. 169, *seq.*] Philosophical associations tended to introduce into the conception of "natural law" the ideas of simplicity and of perfection, and thus the notion came to serve the cause of legal reform. One jurist, Ulpian, attempted to distinguish the *jus naturale* from the *jus gentium*: *jus naturale* he defined as that which nature teaches to all animals, *e.g.* the bringing up of offspring, *jus gentium* as that which is common to the whole human race. In accordance with this distinction, slavery is said to exist *jure gentium*, having arisen out of capture in war; but "by the law of nature all men were born free" (Justinian, *Inst.* i. 2). Later writers tend to regard *jus naturale* or *lex naturalis* as distinct from *jus gentium*, but not simply on the ground taken by Ulpian. The law of nature is to them not merely, as to the older Roman lawyers, a common element amid the diversities of human institutions, but that portion of the "eternal law" or system of divine government in which man as a rational creature can always and everywhere, though in varying degrees, participate, (THOMAS AQUINAS, *Summa*, 1a 2ae, qu. 93. art. 2): whereas the *jus gentium*, containing much that is due to tacit or express agreement, is rather counted as part of positive human law, *jus humanum*, the other part being *jus civile*, the law of this or that particular state. This had been the view of Isidore of Seville (d. 636 A.D.). His *Sententiæ* were a main channel through which scraps of ancient learning passed to the mediæval world. Thomas Aquinas accepts the view of Isidore about the subdivision of human law, but holds that all human law is derived from the law of nature, as conclusions from premisses; so that the *jus gentium* is in a sense natural to man, though distinguishable from the law of nature, especially from that which is common to all animals (1a 2ae, qu. 95, art. 4). Suarez (*De legibus*, ii. 17 and 19), laying still less stress on Ulpian's distinction, agrees on the whole with Aquinas. From these authorities apparently is derived the view of GROTIUS (*q.v.*), who rejects the opinion of Ulpian as of little use (i. 1, § 11), but regards the *jus gentium* as properly a division of instituted human law, *jus voluntarium humanum*, being the product of tacit or express agreements among nations (*Jus gentium*, it should be noted, is coming to mean *jus inter gentes*), whereas the *jus naturale* in the strict sense consists of principles which can be deduced by reason from the primary necessities of man's rational and social nature. But on this subject there is much division of opinion, and even those who adopt the distinction do not always consistently separate the *jus gentium* from the *jus naturale*. PUFENDORF (*De Jure Naturæ et Gentium*, ii. 3, § 22) follows Hobbes (*De Cive*, c. xiv. 5, 4) in dividing natural law into the natural law of individuals and of states—*jus gentium* now meaning quite definitely "international law." Pufendorf denies that there is any positive "law of nations" apart from either the law of nature or the civil law of particular states. Barbeyrac, Grotius's commentator, makes the same criticism. Later writers on the law of nations seem mostly to agree in recognising two elements in the *jus gentium*, one derived from "nature" or reason, the other from the actual usage of the more civilised nations: thus we can distinguish a *jus gentium naturale* and a *jus gentium positivum* or *voluntarium* (see Wheaton's *International Law*, pt. i. ch. i.). This view seems to recognise the element of truth in the conflicting theories.

The law of nature is, by Thomas Aquinas and his followers, regarded as immutable even by the will of God, though it may be added to by the positive law of both God and man. The positive law of God, *jus voluntarium*, *positivum*, or *divinum*, is the law of God as specially revealed to mankind at large, or to any particular portion of mankind. The law of nature might, as coming also from God, "the author of the rational nature of man," be called *jus divinum*; but among Christian theologians that term is generally given to the *jus positivum divinum*. In regard to the positive divine law of the New Testament, a distinction is always recognised by Catholic theologians between "precepts" binding on all men and "counsels of perfection." It may be noted that the schoolmen generally speak of *lex naturalis*, *lex divina*, etc., rather than of *jus*, probably because they are thinking of God as legislator. Grotius (I. i. § 10) holds that the *jus naturale* would exist and be binding even if we were to suppose that there was no God, an attempt to separate jurisprudence from theology which he does not consistently follow out: this Pufendorf (II. 3 § 19) will not allow, holding that the obligation of natural law is from God.

In these theories we have the source not only of the modern German theories of *Naturrecht*, but of these doctrines about "natural liberty," "natural rights," etc. which play so large a part in the politics and economics of the 18th century and even of our own time. It should be noted that in all the more careful writers on the law of nature, that law is supposed to deal not only with what may be supposed to be a "state of nature" apart from human institution, but also with circumstances created by institutions. Thus the rights of private property as they now exist in any particular country are only rights by natural law in the sense that they may not be contrary to natural law, which allows the right to acquire property; but when once such rights have been introduced or defined by positive human law, obligations to respect property-rights are created which are obligations of natural law apart from positive institution. Pufendorf would not regard such obligations as belonging to natural law in the strictest sense, but only "reductively" (II. 3, § 21), and Thomas Aquinas carefully distinguishes the senses in which anything may be said to be according to the law of nature (1a 2ae, qu. 95, art. 5). Such careful distinctions are not always observed by those who have used the phraseology of natural rights in later times, especially in practical controversies (see INTERNATIONAL LAW; LAW).

[Besides Maine, *Ancient Law* (1st ed. 1861) and the other works referred to in the article, may be named Moritz Voigt, *Das jus naturale, aequum et bonum und jus gentium der Römer*, 4 vols., Leipzig, 1856-75.—J. Bonar, *Philosophy and Political Economy*, 1893, bk. ii.—D. G. Ritchie, *Natural Rights*, 1895, ch. ii.—Lorimer, *Institutes of Law* (1st ed. 1872, 2nd ed. 1880) is an application of the German theory of *Naturrecht*.]

D. G. R.

JUS RELICTÆ (Scots Law). The widow's share of the free movable property, other than personal bonds bearing interest, of a predeceasing husband; one third if he have left children, one half if none. This share is reckoned after the predeceasing husband's personal obligations have been provided for: hence the widow may have both *jus relictæ* and a right to demand performance of the provisions of a settlement, unless she have, either explicitly or by inevitable implication, and with full knowledge of her legal rights, given up her *jus relictæ*. This widow's right takes precedence of any will made by the predeceasing husband, and vests in her by mere operation of law; and it can be enforced against the husband's executor. By the Scotch Married Women's Property Act of 1881, § 6, a surviving husband is given an analogous right over the estate of the predeceasing wife.

JUS STILLICIDII. See SERVITUDE.

JUST PRICE. See JUSTUM PRETIUM.

JUSTA CAUSA. According to Roman law a delivery of property in order to operate as a conveyance by delivery (*traditio*) must be accompanied by a legal act, such as a contract of sale or exchange, showing an intention to transfer the right of property in it. The term for a legal act of this nature is *justa causa traditionis*.

E. A. W.

JUSTI, JOHANN HEINRICH GOTTLOB VON (1720-1771), a German economist, was born at Brücken in Thuringia. He studied jurisprudence at Wittenberg, and afterwards—having served meantime in the Prussian army—at Jena and Leipzig. He was then for some time in the service of the Duchess of Sachsen-Eisenach. He was made, apparently in 1750, professor of the cameral sciences in the newly-founded Ritter-Akademie (Theresianum) at Vienna, and is by some accused of having changed for the time his religious profession in order to obtain this appointment. The outline of economic doctrine which he prepared with a view to his lectures was warmly approved by the then minister Haugwitz, and he was employed in various commissions by the government. In 1753 he quitted the Austrian service, and at Erfurt and Leipzig engaged in various literary undertakings for a livelihood. In 1755 he settled at Göttingen as member of the council of mines and commissioner of police. In 1757 he went to Copenhagen, and, coming thence to Berlin, was made director of mines and superintendent of glass and steel works. He was, however, frequently in collision with his colleagues and subordinates, and was finally disgraced in consequence of a deficit in his accounts, due apparently not to fraudulent design, but to his improvident household management and singularly unsystematic mode of life. He died a prisoner in the fortress of Küstrin.

Justi was a man of remarkable gifts and indefatigable industry. His importance in the history of political economy arises from the fact that he was the first German systematic writer on the science. In his earlier publications he stands on the basis of the mercantilist doctrine, but in his later works he was influenced by the encyclopædists and tended towards views similar to those of the physiocratic school. His principal economic writings were: *Staatswirthschaft oder systematische Abhandlung aller ökonomischen- und Cameralwissenschaften*, 1755, dedicated to the Empress Maria Theresa, of whose political practice his work is the theoretical counterpart; *Entdeckte Ursuchen von dem verderbten Münzwesen*, 1755, in which he denounced the debasement of the currency by the King of Prussia and the Duke of Würtemberg; *Grundsätze der Polizeiwissenschaft*, 1756, a treatise on administration, a branch of theory of which L. von Stein declares him to have been the father, but which he unduly extended so as to make it include the subjects of the circulation of money and public credit; in this treatise occurs his well-known dictum that a state cannot have too many inhabitants; *Abhandlung von den Steuern und Aufgaben*, 1762, in which he proposed to substi-

tute for excise duties a tax on the net profits of traders; and *System des Finanzwesens*, 1766, dedicated to Frederick the Great; this was the first systematic work in German on the subject of finance; it gives, says Cossa, the rational classification of public expenses, and contains a good account of sources of revenue, but an insufficient treatment of public loans. In the spirit of the mercantilists, he regards taxes as "bridles" to be used by a government in directing the industry of producers into the lines most advantageous to the whole community. A number of his minor pieces on economics were published collectively in two vols. in 1760-61, and another series in three parts (1761-64), in which the most remarkable is *Von der Finanzverwaltung des Postwesens*, in which he objects to the monopoly possessed by the state post-office, and condemns the practice of making the post, in any great degree, a source of public income.

I.

JUSTICE or JUSTICIARE is a word frequently used by Madox in his description of the collection of a scutage. When a tenant *in capite* was unable to make his tenants pay the amounts due from them, he was in the habit of obtaining the permission of the court of exchequer to *justiciare tenentes suos*, meaning thereby, to distrain on their goods, and, if necessary, to call in the aid of the sheriff to enable him to do so. (*See* KNIGHT'S SERVICE.)

[Madox, *History of the Exchequer*, London, 1769.] A. E. S.

JUSTICE, ALEXANDER (c. early 18th century), besides his work *A general treatise of the Dominion and Laws of the Sea*, ancient and modern (especially French and English), together with a proposal to abolish *Pressing for the Navy*, 1705, which includes information on marine insurance, also wrote a *General Treatise of Monies and Exchanges: In which those of all Trading Nations are particularly described and considered. With an Account of all the Foreign Banks and different Species and Denominations of Monies . . . and of the Method and Practice of Foreign and Domestic Exchanges* (1707), a merchants' handbook of English and foreign coinage, banks, mercantile bills and notes, weights and measures, and exchanges. In the dedication, speaking of exchange, he says, "some years' experience I have had myself in that way of business," and the work is entirely that of a practical man, never touching the theoretical side of his subject.

[See Thorold Rogers, *First Nine Years of the Bank of England*, 1887, pp. 37, 42.] E. G. P.

JUSTICE SEAT. See FORESTS, MEDIÆVAL.

JUSTUM PRETIUM, "just price." The doctrine of "just price"—that there was for every article at a particular time a just price, for which alone it should be sold—played a great part in the economic teaching of the mediæval church, and had great influence upon the action of the public authorities. The stress which the great schoolmen, beginning with Peter Lombard, laid upon it from the 12th century onwards, must be explained not only by the growth of trade, but also by the revived study of the Roman law, which had laid down that every man had a natural right to overreach another; against this teaching the doctrine of the church must be regarded as a conscious protest. It was formulated systematically in the *Summa Theologica* of AQUINAS, who was followed by most subsequent writers. But although Aquinas and the other schoolmen felt no difficulty in proving that it was not allowable in conscience, whatever might be the rule of civil law, to sell a thing for more than it was worth, they seldom gave much attention to the question what constituted just price. It is probable, however, that what some of them definitely stated, for instance LANGENSTEIN—viz. that a man could determine for himself the just price of the wares he had to sell by simply reckoning what he needed in order to suitably support himself in his rank in life—was assumed as a matter of course by Aquinas and other writers. The whole scholastic and canonist view of society rested on the idea of *status;* and this particular doctrine was only applicable so long as every class directly or indirectly engaged in production had a recognised standard of living. And even then difficulties were presented by wares like corn, the supply of which depended upon the seasons. Here it was impossible not to allow that the price must vary; but it was attempted to remove as far as possible all opportunity for the arbitrary exercise of the individual will, by insisting that the whole local supply should be laid before the whole body of purchasers in the open market. This was to a large extent the motive which guided legislation in the matter of forestalling, etc.

Knies and others have remarked that what the doctrine of just price aimed at may be described as a *normal* price, in accordance with *cost of production*, instead of a fluctuating price dependent upon the chances of the market. This is an accurate description, if it be understood that cost of production was to be determined by a fixed standard of living on the part of the producers, and was not to include any element of *interest*. Perhaps the contrast between mediæval and modern ideas of value is best expressed by saying that to us value is usually something subjective, consisting of the mental determination of seller and buyer, while to the schoolmen it was in a sense objective,

something intrinsically bound up with the commodity itself.

[W. Endemann, *Studien in der romanisch-kanonistischen Wirthschafts- u. Rechtslehre*, vol. ii. (1883), v.—Ashley, *Economic History* (pt. i. 1888, pt. ii. 1893), §§ 16, 64.] W. J. A.

KACORAWNS, money once current in Guinea and Benin "which is *gold* drawn out into *wier*, and cut afterwards into small pieces for all triviall commodities." No minted coin appears to have been employed at this period (*circa* 1650) in these countries, the payment being made in gold and by weight.

[Lewes Roberts, *The Merchant's Mappe of Commerce*, London, 1638.]

KANE, Sir Robert John (1809-1890), was an Irish scientist and statistician. In 1843 he delivered a course of lectures in Dublin, which in the following year he published under the title of *The Industrial Resources of Ireland* (2nd ed., Dublin 1845, 8vo). His object was, he tells us, "to obtain materials for the discussion of the problem . . . what field of *work* does Ireland really present?" After describing the geological strata of Ireland, the lie of the coal and other mineral beds, her water power, agriculture, linen trade, and her excellent internal communication by means of navigable rivers, lakes, canals, and railways, he compares the low average cost of unskilled labour with the dearness and scarcity of skilled labour, and in conclusion insists that Ireland will never become rich by waiting idly for English capital to come to her: she must, the author points out, create a capital for herself, always remembering that "labour is capital: intellect is capital."

In 1846 Kane was knighted, and the same year was appointed director of the Museum of Irish Industry, for the foundation of which he had successfully agitated. In 1873 he was made a commissioner of national education, and, in 1877, elected president of the Royal Irish Academy. In 1880 he became vice-chancellor of the newly created Royal University of Ireland.

He published *The Large and Small Farm Question Considered*, 1844, in which he advocated the formation of small farms in Ireland.—*Address delivered at the Public Distribution of Prizes . . . by Sir John R. Kane*, Cork, Queen's College, 1850, 8vo.—*Elements of Practical Pharmacy*, Dublin, 1831, 12mo.—*Elements of Chemistry, Illustrated*, Dublin, 1846, 8vo; 2nd ed. 1849, 8vo.—*The Queen's University in Ireland and the Queen's Colleges; Their Progress and Present State*, Dublin, 1856, 8vo.—*The Irish Watering Places*, 1845, 8vo. A. L.

KANT, Immanuel (1724-1804). Kant was born and bred at Königsberg, East Prussia; and, except the few years when he was private tutor a few miles off, the whole of his life was spent in his native town. From 1755 to 1770 he gave lectures at the university on mathematics, philosophy, and theology, becoming professor of philosophy 1770, and doing the work of the chair till 1797. His *Critique of Pure Reason* appeared in 1781; *Critique of Judgment*, 1790; *Doctrine of Right, and Doctrine of Virtue* (*Metaphysic of Ethics*), 1797. His complete works fill eight stout octavo volumes in Hartenstein's newer edition (1867 *seq.*, Leipzig).

Kant is to modern philosophy what Adam Smith is to modern economics. Professor Oncken has even tried to show an agreement between them in philosophy (*Adam Smith und Immanuel Kant*, Leipzig, 1877). They agree, he says, in reintroducing teleology alongside of mechanism in the world. They both, he says, distinguish between the world of spirit and the world of sense, Adam Smith's *Moral Sentiments* being supposed to deal specially with the spiritual world, his *Wealth of Nations* with the sensible. Kant's dualism, however, was not merely of two aspects or elements of the same world; he conceived man to be member, at the same time, of two entirely different worlds. As the recipient of impressions from the senses man is strictly under physical law; his very motives, as sensible, are part of the world-wide chain of causes and effects. He is a phenomenon among phenomena. But as a moral being he is a law to himself and an end to himself, a cause but not an effect. He is a noumenon, a member of the intelligible as distinguished from the sensible world. It is impossible to find any conception closely approaching this in Adam Smith, though we may grant to Professor Oncken that the two philosophers both conceive religion to represent duty as divine commandment. Their agreement reaches farther in the neutral sphere of political philosophy. Kant conceives civil society as existing to secure not the happiness of its members, which depends on themselves, but their freedom. It is founded on an original contract, not as a fact of history, but as a logical postulate. All give up their original license under the law of nature, in order to get real liberty by a political union. This liberty is the end of all laws; the first principle of law or right is: "So act that your freedom shall not interfere with another man's freedom." Force may be used to secure this. Kant's view of the powers of the state approached absolutism, though he had also a weak side for the French revolution, and allowed that when men are ripe for it, a republic is the best form of government.

Originally, which means no more than in abstraction from civil society, all land was in common—Kant does not say all things were—

and private ownership is founded on the social contract, and therefore, in a sense, on a common ownership. The state secures private rights, and in return may tax private owners. It was argued that the state may impress citizens as soldiers, because the state alone allows these citizens to exist, and thus in a sense creates and owns them. But men should also be ends, not means.

Kant's state is essentially regulative rather than constructive or socialistic. The notion of contract is stretched by him very far, to include, for example, marriage. It is under the head of contract that he lays down most of his economic propositions, which are not very profound. He does not, like Locke, base property on labour; he defines money as the means of exchanging one man's industry with another's, but labour plays, on the whole, a minor part in his notion of economical arrangements. Silver seems to him the best money; and he finds an analogy between money, as a means of exchanging goods, and books, as a means of exchanging ideas. He quotes the *Wealth of Nations*, rather loosely, and speaks in praise of commerce and trade. Though the commercial spirit seems, like the aristocratic, unsocial, it will one day, he thinks, lead to the fulfilment of his fond hope of a permanent peace among the nations. In his *Anthropology* (1798) he gives his estimate of the nations as they were then. The French, he says, have given the world the language of conversation, the English the language of trade. The difference of national character appears even in the way in which, for example, a rich man is described. In English, "he is worth a million"; in Dutch, "he commands a million"; in French, "he possesses a million." In Kant's essay on the "Aufklärung" or *Illumination* (1784), and on Herder's *Philosophy of History* (1785), he gives his view of what was even then called evolution. It is, he says, essentially a notion of metaphysics, and not of physical science; but it is not therefore the less but the more trustworthy.

Kant's followers were often economists (see GERMAN SCHOOL), but he needs mention in a history of political economy chiefly because his philosophy begat that of FICHTE and HEGEL, which determined the character of modern German socialism.

[The best English account of Kant's whole philosophy is by Edward Caird, Master of Balliol, *The Critical Philosophy of Immanuel Kant* (Maclehose, Glasgow, 2 vols., 1889). The literature on Kant, both in English and in German, is very large. For the economical passages in his writings, compare Bonar's *Philosophy and Political Economy* (Sonnenschein, 1893).] J. B.

KARL FRIEDRICH (1728-1811), at first margrave, then (1803) elector, and finally (1806) grand duke of Baden, was born at Carlsruhe. Succeeding his grandfather before he was ten years old, he finished his studies, and visited France, Italy, England, and Holland before returning to Carlsruhe. His regime was tolerant and enlightened, and he attracted many residents to his state. He preserved his dominions from the evils suffered by others during the Seven Years' War, and made great sacrifices to maintain peace with revolutionary France. He excluded the *emigrés* from Baden, and remained faithful to the fortunes of Napoleon, by whose aid he greatly enlarged his possessions. His *Abrégé des Principes de l'Économie Politique* appeared in the *Éphémérides du Citoyen*, Paris, 1772, with a preface by Dupont de Nemours. It was dedicated to the Marquis de MIRABEAU, for whom the author had a profound admiration. He was the most important German convert won by the physiocrats. His book is of little scientific value and contains nothing original, but it produced a considerable effect at the time of its appearance, and has still a certain historical interest as proceeding from the chief of a State.[1]

[See C. Knies, *Carl Friedrichs von Baden brieflicher Verkehr mit Mirabeau und Du Pont* (Heidelberg, 1892).—Review of this in *Econ. Jour.*, vol. iii. 1892.] J. K. I.

KAY-SHUTTLEWORTH, SIR JAMES PHILLIPS (1804-1877), the founder of the modern national school system. He studied medicine at Edinburgh, where he took his M.D. in 1827. Both as student and practitioner at Manchester, he devoted much time to the housing and sanitary condition of the poor. The cholera outbreak in 1832 confirmed many of his conclusions, and resulted in the publication of his pamphlet on *The Moral and Physical Condition of the Working Classes employed in the Cotton Manufacture in Manchester* (London 1832, 8vo). In 1831, he published an anonymous *Letter to the people of Lancashire concerning the future representation of the Commercial Interest*. He was an ardent advocate for parliamentary reform and the repeal of the corn laws. In 1834 he was chosen to introduce the new poor law locally, and next year became assistant poor-law commissioner. In 1841 the government published his reports on the training of pauper children. The subject of national education became henceforth the study of his life; and in 1839 he was appointed secretary to a committee of privy council, nominated to dispose of public money voted for purposes of national education. This same year—with the help of a friend—he established the first training college for teachers at Battersea. During the cotton famine of 1861-65, Kay-Shuttleworth—who had been created a baronet under this name in 1849—worked vigorously to relieve, without pauperising, the poor. In 1863, he was high sheriff

[1] Refer to his experiment on *Impôt Unique*, and to account of this by Emminghaus mentioned *s.v.* IMPÔT UNIQUE.

of Lancashire, and in 1870 received the honorary degree of D.C.L. from the university of Oxford.

His numerous writings on educational and social questions are chiefly collected in the following volumes:—*Public Education as affected by the Minutes of the Committee of Privy Council*, 1846-52, London, 1853, 8vo.—*Four Periods of Public Education as reviewed in* 1832, 1839, 1846, and 1862, London, 1863, 8vo.—*Thoughts and Suggestions on Certain Social Problems*, etc. . . . London, 1873, 8vo.—*The Results of the Education Act*, Fortnightly Review, May 1876. A. L.

KELLEY, WILLIAM D. (1814-1890), born in Philadelphia, practised law, served as judge from 1846 until 1856; in 1854 abandoned the democratic party and became a republican and protectionist. In 1861 he entered Congress and served until his death. He was thoroughly identified with the cause of protection, serving for many years on the committee of ways and means, and for a portion of his term as its chairman. His loyalty to the protective system was unwavering, and is well expressed in a speech made 25th March 1870, which also illustrates the views of many of his party.

"Protection cheapens commodities; the internal revenue system is expensive and inquisitorial and should be abolished at the earliest possible day; free trade means low wages and a limited market for grain; protective duties are not a tax; protection stimulates immigration; skilled workmen are the most valuable commodity we can import."

He was earnest in his advocacy of legal tender treasury notes, convertible into securities, the interest of which should be payable in the same currency. In his support of legal tenders he opposed the extension of the national banking system. At the close of the civil war he opposed the contraction of the currency, and made a speech in favour of what he termed an inexportable currency. He also supported the silver legislation of 1878.

[His opinions are typical of a considerable group within his own party, and thus stand in economic history for more than an individual expression. They may be found expressed in *Speeches, Addresses, and Letters on Industrial and Financial Questions*, Philadelphia, 1872, pp. xxx. 514.] D. R. D.

KELLOGG, EDWARD (1790-1858), born in Norwalk, Conn., engaged in business in New York, and died there. His interest in economic questions was aroused by the crisis of 1837, for which various causes were assigned by different investigators. He came to the conclusion that commercial disturbances and economic evils in general were due to a lack of credit facilities. He consequently proposed a national currency to be based upon actual property or land security to be loaned to individuals at a uniform rate of interest and therefore of uniform value in all parts of the country. Through this agency wealth would be more fairly distributed, as labour would not be subject to capital.

This thesis is developed at length in *Currency, the Evil and Remedy*, by Godek Gardwell, N.Y., 1844.—*Labour and Other Capital, the Rights of each Secured*, N.Y., 1849, pp. 298; and in a revised edition of the latter, entitled *A New Monetary System the only Means of securing the Rights of Labour and Property*, N.Y., 1861, pp. 366. D. R. D.

KELP, RENT OF, instanced by Adam Smith (*W. of N.*, ed. M'Culloch, p. 66) to prove that rent may be exacted for land never improved by human industry. Kelp-burning was practised in Ireland long before it was begun, towards the middle of the 18th century, on the western coasts and islands of Scotland. Estates hitherto valueless brought in large kelp-rents to their owners; but since changes in chemical processes have greatly diminished the demand for kelp, many of the shores on which it was gathered below high water-mark have ceased to produce rent. In 1845 nearly one-third of the rental of one parish in the Orkneys was being paid for kelp, at the rate of two guineas per ton, a great decrease from earlier rates; in another parish the decrease was from £20 or £15 a ton to £5. As late as 1827 the landlords of a parish in Sanday island were estimated to receive a kelp-rent of £4320, or £9 a ton. On the chief estate in South Uist reductions in the price of kelp reduced the rental by more than two-thirds. When the price was high £20 a ton was an ordinary rent, and even in 1830 the net kelp-rent of the western islands of Scotland was £20,000, of North Uist alone £7000.

The manufacture still continues on the Irish coasts, though at lowered prices, ranging at present from £1 to £5 a ton according to quality and time of year.

Arthur Young (*Tour in Ireland*, 1780) gives several instances of rent paid by kelp shores; in Galway, he says, "the shore is let with the land against it, and is what the people pay their rent by" (p. 231); in Sligo he mentions an estate the coast of which let for £100 a year for making kelp (p. 215). But he gives few figures.

[*Statistical Account of Scotland*, 1845, vol. xiv., xv.—*Penny Encyclopædia*, 1839, art. "Kelp."—Brewster's *Edinburgh Encyclopædia*, 1830, art. "Scotland."—Private information from Ireland.—*Times*, 12th November 1890.] E. G. P.

KEMPER, JEROMMO DE BOSCH (1808-1876), son of Joan Melchior Kemper, born at Amsterdam, studied law at Leyden, 1825-1830. He became a famous criminalist, and from 1834-1852 was public prosecutor. In 1852 he was appointed professor at the university of Amsterdam. For a short time he was also a member of the states-general. He rendered great services to the study of statistics by founding the Dutch Statistical Society. His principal works on economical subjects are:—*Geschiedkundig onderzœk naar de Armoede in ons vader-*

land, hare oorzaken, en de middelen, die tot hare vermindering zouden kunnen worden aangewend (Historical Inquiry into Pauperism in our Country; its Causes and the Means to diminish it), Haarlem: Erven Loosjes, 1851. *Handleiding tot de kennis van de wetenschap der samenleving* (Treatise on Social Science), Amsterdam, 1863.

Kemper belonged to the historical school. His works give evidence of enormous reading on a variety of subjects. His method is eclectic. He advocated scientifically and politically the "*juste milieu*"; but his principles are somewhat vague.

His treatise on social science is a very important work, full of learning; it is an introduction to his political history of Holland, and his system of Dutch public law.

A. F. v. L.

KERNETTY was one of the items in the revenue of the petty princes of Ireland, as distinguished from the monarch. It was a land tax of 3s. 4d. per acre on ploughed land, and was devoted to the maintenance of the prince's mansion house. C. A. H.

KERSSEBOOM, WILLEM (1691-1771), a Dutch actuary, and an able representative of those economic students who followed the method of inquiry styled political arithmetic (see ARITHMETIC, POLITICAL), was brought into notice through his books written between the years 1737-1742. He was an official in the financial administration of the province of Holland, which at that time possessed sovereignty; and having to superintend the government contracts relating to annuities, was led to calculate one of the earliest tables of mortality and survival. On these tables, calculated by means of direct observation, he bestowed a vast amount of labour. They served as the basis for the valuation of life annuities, in those days an important source of revenue to the Province, and won him a well-merited reputation as an actuary.

He endeavoured to calculate also the number of the population by applying his tables of survival to the number of the births. This ingenious estimate, made at a time when exact statistics of the population were yet unheard of, would have secured his reputation, had the number of births on which he based the whole calculation been correct. This, however, was not in the least the case, the number of births being only a rather rough estimate. The value of these books as statistics is therefore not equal to their ingenuity.

[On Kersseboom, see X. Heuschling, *Bull. de la Comm. Centr. de Stat. de la Belgique*, tome vii. p. 397; Dr. A. Boaujon, *Jubilee volume of the Paris Stat. Soc.*, 1866, p. 66; John, *History of Statistics*, i. p. 227 *et seq.*; also article in *Handwörterbuch der Staatswissenschaften.*] C. A. V. S.

KEYS, QUEEN'S (Scots Law). That part of a warrant which authorises a messenger-at-arms to break locks, in order to get at a debtor or his goods. A. D.

KHRAN. The standard of value and the money of account in Persia. A silver coin weighing 71 grains; fineness varying from ·760 to ·900. Value: English standard (925 fine at 5s. 6d. an oz.), 8·4d.; French standard (silver francs 900 fine), ·88 franc. F. E. A.

The exchange value of the khran has fallen greatly since 1865, owing as much to uncertainty as to its intrinsic value as to the fall in the gold price of silver. C. A. H.

KIND, PAYMENTS IN. The payment of rent, wages, and other dues in commodities other than money, usually in agricultural produce—known in England as payment "in kind"—was, in early society and in mediæval times, but part of a condition of things to which HILDEBRAND (*q.v.*), and many German economists and historians following him, have given the name "Natural-wirthschaft." In this "natural," as opposed to a "money," "economy," the distribution of wealth, so far as it took place at all outside the family, was effected by equivalencies of land, services, and commodities, especially of grain, without the intervention of money: feudalism has been not inaptly described as but a peculiar form of "natural economy." In the earliest economic stages, payment in kind may be looked upon as an outcome of the method of barter which prevailed in all exchanges; but long after barter had disappeared in all ordinary buying and selling, the periodical dues of serfs and even of other tenants continued to be paid, partially at least, in kind. Over large parts of Europe the practice has survived to the present day in the shape of MÉTAYER tenure (*q.v.*). In industry, the payment of wages partly in commodities was among the earliest evils complained of upon the rise of the domestic manufacture, and gave rise to legislation in England as early as 3 Hen. VIII. The TRUCK SYSTEM (*q.v.*), as it was called, continued to exist in spite of renewed legislative prohibition, and became even more widespread upon the advent of the "great industry." The act of 1 & 2 William IV. c. 37 went far to destroy it, but it lingered on for some time, here and there, in various forms.

[Bruno Hildebrand's distinction between *Natural-* and *Geld-wirthschaft* is referred to in his *Nationalökonomie der Gegenwart und Zukunft* (1848), and worked out at length in an article in his *Jahrbücher für N. O.*, vol. ii. (1864). For the English Middle Ages see Ashley, *Econ. Hist.*, i. pt. 1, § 6; for the German, K. W. Nitzsch, *Gesch. d. deutschen Volkes* (2nd ed. 1892), *passim.* Adam Smith, following the physiocrats, regarded the metayer tenure as altogether unsatisfactory, and declared that rents in kind and rents in service were "always more hurtful to the tenant than beneficial to the landlord" (*W. of N.*, bk. v.

ch. ii. art. 1). J. S. Mill, however, took up its defence, so far as Italy was concerned, and "regretted that a state of rural well-being . . . should be put to hazard by an attempt to introduce . . . a system of money-rents and capi-talist farmers" (*Principles of Political Economy*, bk. ii. ch. viii. § 4). Of the truck system a brief account is given by Brentano, in Schönberg's *Handbuch d. P. Œ.* (1882), i. 971. Adam Smith held that "the law which obliged the masters in several different trades to pay their workmen in money and not in goods" was "quite just and equitable." The truck method has been commonly, and no doubt justly in the main, condemned as a means of undue control by masters over their men. Yet some among the thorough-going Radicals objected to the legislation of 1831, and maintained that "such state interference in freedom of contract" was "always mischievous" (see *Frederick Hill, an Autobiography*, 1893, p. 76).] W. J. A.

KING, Charles (fl. 1713), chamberkeeper to the treasury, merchant of London, was the editor and joint author of the *British Merchant*, a periodical published in opposition to the government, in 1713-14, during the controversy on the 8th and 9th clauses of the Treaty of Utrecht. These clauses provided (1) that all subjects of Queen Anne and the king of France should enjoy the same commercial privileges as the most favoured nation; (2) that, on the part of England, the duties on French goods should not be greater than the duties on those of any other country, and all prohibitive laws passed since 1664 should be repealed; (3) that, on the part of France, English goods should be rated according to the tariff of 1664, and all laws contrary to that tariff should be repealed. The approach to freedom of trade implied in these clauses aroused the opposition of the commercial classes, and when Defoe defended the government proposals in the *Mercator*, the *British Merchant*, under the editorship of Charles King, was published in order to counteract his influence. In addition to King, the writers who contributed articles were, Henry Martin, "who had the greatest hand in them," Sir Charles Cooke, Sir Theodore Janssen, James Milner, Nathaniel Toriano, Joshua Gee, Christopher Haynes, David Martin, and others. The agitation was successful, and the obnoxious clauses were abandoned. In 1721, King collected the papers and republished them with the title *The British Merchant; or, Commerce Preserv'd*, 3 vols. 8vo. By the order of the Earl of Sunderland when he was first lord of the treasury, a copy of this work was sent to every parliamentary borough for the use of the inhabitants.

[For a notice of King, see *Dictionary of National Biography*.] W. A. S. H.

KING, Gregory (1648-1712), was perhaps the ablest of the small group of 17th century writers who laid the foundations of statistical investigation in England. His work, *Natural and Political Observations upon the state and condition of England*, 1696, was for that period a remarkable achievement, and there is much in it of permanent value and interest. Only certain sections of it, however, published in Charles Davenant's *Essay upon the Probable Methods of making a people gainers in the Ballance of Trade*, etc., London, 1699, 8vo, were accessible to King's contemporaries. In 1802 George Chalmers appended large selections from it to his *Estimate of the Comparative Strength of Great Britain*, etc., London, 8vo; 2nd edition, 1804, 8vo. Chalmers also published a complete edition with the title, *Natural and Political Observations and Conclusions upon the state and condition of England*, 1696, by Gregory King, Esq., Lancaster Herald. *To which is prefixed, A Life of the Author*, etc. A new edition, London, 1810, 8vo.

In this work, King states that "the ensuing treatise depends chiefly upon the knowledge of the true number of the people in England, and such other circumstances relating thereunto, as have been collected from the assessments on marriages, births, and burials, parish reports, and other public accounts." Section i. deals with the population. Taking as the basis of his calculations the returns from the hearth tax, on Lady Day, 1690, King reckons that there were 1,319,215 houses on that day. He allows an increase of 1000 per annum, and subtracts 1 in 36 or 37, which he estimates were improperly included in the hearth-tax returns. He thus calculates that in 1696 there were about 1,300,000 inhabited houses. He then calculates the "number of souls" per house from "the said assessments on marriages, births, and burials in several parts of the kingdom" to be $5\frac{1}{2}$ in London, within the walls; $4\frac{1}{2}$ full for the six parishes without the walls; $4\frac{1}{2}$ almost for the rest of the bills of mortality; $4\frac{1}{3}$ "at a medium" for cities and market towns; and 4 "at a medium" for villages and hamlets; he adds 104,460 for omissions in the assessments; 80,000 "transitory people and vagrants"; and reaches a total of about 5,500,000. In section ii. he discusses "the proportion of England, in acres and people, to France, and Holland to Europe, and to the world in general; with a calculation of the number of the people now in the world"; in section iii. "the several distinctions of the people, as to males and females, married and unmarried, children, servants, and sojourners." Using the same authorities, he calculates that in London and the district covered by the bills of mortality there were 10 males to 13 females; in cities and market towns, 8 to 9; and in villages and hamlets, 100 to 99. In section iv. he discusses "the

several ages of the people"; in section v. "the origination and increase of the people of England"; and concludes (1) "that although each marriage in London produces fewer people than in the country, yet London in general . . . is more prolific than the other great towns; and the great towns than the country; (2) that if the people of London of all ages were as long-lived as those in the country, London would increase in people much faster *pro ratâ* than the country"; and (3) that the principal checks in London on the growth of population were immorality, luxury, and intemperance, "greater intenseness to business," "unhealthfulness of coal and smoke," and a relatively greater disparity of age between husbands and wives. On the last point he gives some observations based upon the Lichfield registers. In section vi. he deals with "the annual income and expense of the nation as it stood in anno 1688"; giving his famous "Scheme" printed by Davenant, and the quantity of silver and gold in England, France, and Holland, in Europe, and "the world in general"; in section vii. "the several sorts of land in England, with the value and product thereof." In his estimate of the "yearly consumption of flesh," he calculates that there were 1,280,000 persons who by reason of their poverty did not contribute to church or poor, and consequently eat not flesh above 2 days in 7, and 1,020,000 who received alms and consequently eat not flesh above once a week." His estimate of the influence on the price of corn, if a defect of one-tenth, two-tenths, be in the harvest, was adopted by many subsequent writers.[1] Sections viii. to xiii. are taken up with calculations of revenue, the probable yield of certain taxes proposed by him, a comparison of the state of England, France, and Holland, etc. There are also appended to Chalmers's edition of King's work "A scheme of the inhabitants of the city of Gloucester," and "A computation of the endowed hospitals and alms houses in England."

[Full particulars of King's life and a list of his heraldic and other works are given in the *Dictionary of National Biography*.] W. A. S. H.

KING, PETER, Lord (1776-1833), collaterally related to the philosopher Locke, is perhaps best remembered by economists in connection with the instructions which he issued in 1811 to his tenantry requiring them to pay their rents in gold, or in notes sufficient by the purchase of gold "to secure the payment of the real intrinsic value of the sum stipulated." King thus practically asserted the fact of the *depreciation* of the Monetary Standard (see BULLION COM., Report of); the theory had been stated in his *Thoughts on the Effects of the Bank Restriction;* 1st. ed., 1803, 2nd ed., 1804, under title, *Thoughts on the Restriction of Payments in Specie at the Banks of England and Ireland.* In this classical tract King lays down two tests of depreciation, the market price of bullion and the state of the exchanges ("King's Law," Macleod, *Theory of Banking*). It should be observed that the depreciation which King attributed to the bank-notes was understood by him in a wider sense than what has been called DEPRECIATION *proper* — diminution in the value of the paper relatively to gold. Thus, he assumes in his *Thoughts* (1803) that the bullion has not become dear but the paper cheap (Lord Fortescue's edition, p. 76). And in the speech justifying the letter to his tenantry (1811), he maintains that "the gold itself, compared with the best standard of value, has in all probability become much cheaper and more abundant" (*ibid.* pp. 240-244). The contrary is affirmed by Mill (*Pol. Econ.*, bk. iii. ch. xiii. § 6), following Tooke (*History of Prices*, pt. i.). The "great city job," as King called the bank restriction, was not the only object of his attack; he also directed a brilliant tract and several speeches in parliament against the "grand land job," the corn laws.

[Lord King wrote the *Life of Locke;* his tracts and speeches relating to bank restriction, corn laws, and other economic subjects, are collected in the *Selection from the Speeches and Writings of the Late Lord King* by Earl Fortescue, 1844. There is an appreciative review of the *Thoughts* by Horner in the second volume of the *Edinburgh Review*. See also Ricardo's *Letters to Malthus*, pp. 148, 150; Hansard, 1822, vol. vii. p. 1397.] F. Y. E.

KING'S CATTLE (*i.e.* chattels) was a term applied to the Jews in early English history, because they or their estates were reckoned a part of the king's revenue, or rather a source of his revenue, taxable at will. The profits of the levies on them were sometimes farmed out (see JEWS, EXCHEQUER OF THE). C. A. H.

KING'S PEACE. At a time when private feud was prevalent in England, there were certain places and occasions which were specially under the protection of the king. To disturb the peace at such places and on such occasions was an offence against the king's peace. The king's peace was analogous to the peace of every household, which it was an offence to disturb, or to the peace of the church, which, however, soon came into the province of the king's peace, but it was a graver offence to disturb the king's peace than to disturb any other person's peace. Gradually the king's peace came to be extended beyond the small number of places which it protected originally. Thus it is provided in

[1] This estimate, sometimes known as "Gregory King's Law," is set out in full in the art. on CH. DAVENANT. It supposes that a defect in the harvest may raise the price of corn in the following proportions:—

Defect.		Above the Common Rate.
1 tenth	raises the price	3 tenths
2 tenths		8 ,,
3 ,,		1·6 ,,
4 ,,		2·8 ,,
5 ,,		4·5 ,,

the laws of William the Conqueror that violence on one of the four great public roads (Watling Street, Erming Street, Fosse, Hykenild) is a breach of the king's peace; and gradually the king's peace came to be extended over the whole kingdom. The officers appointed to keep order, and prevent and punish criminal offences were, therefore, called "custodians of the peace," subsequently "justices of the peace," and the words "against the peace of our Sovereign Lady the Queen" still occur in indictments for criminal offences.

[Sir F. Pollock, The King's Peace, *Law Quart. Rev.*, vol. i.—Pollock and Maitland, *Hist. of Eng. Law.*] F. S.

KINGSLEY, CHARLES (1819-1875), born at Holne vicarage, Devonshire, was son of the Rev. Charles Kingsley, who held the living of Barnack in Northamptonshire, 1824-1830, and was then at Clovelly, 1830-1836, until presented to St. Luke's, Chelsea, 1836-1860. To these surroundings in the fen country and the Devonshire village many of the influences moulding C. Kingsley's tastes may be traced. In 1831 he was sent to a school at Clifton, where he witnessed the Bristol riots of the same year, which, he said later, were his first lesson in social science. In 1836 he became a student of King's College, London, and in 1838 he entered Magdalene College, Cambridge. He threw himself with great eagerness into the many interests of the place, pursuing his studies in an erratic fashion, which prevented him from attaining the highest distinctions in his examinations. In July 1842 he was ordained to the curacy of Eversley, Hampshire, a place with which he was, with the exception of a very short interval, connected until his death, as he was presented to the living in 1844. In 1845 he was appointed a canon of Middleham. In addition to his pastoral work during these and the following years, Kingsley was engaged in writing, in teaching, and in studying social questions as they came under his own observation as a country clergyman, and as they were thought out by F. D. MAURICE, with whom an acquaintanceship, begun in 1844, soon ripened into friendship. In 1848 he accepted the professorship of English literature and composition at Queen's College, Harley St., of which Maurice was then president, but resigned on account of ill-health in the following year. Maurice's influence over Kingsley was unbounded, and on many points the latter claimed to be but the interpreter and populariser of his friend's views. Taking as active a part as his residence and work in the country permitted during the Chartist movement of 1848, Kingsley worked with J. M. Ludlow, Thos. Hughes, and others who, under the guidance of Maurice, advocated reform rather than revolution as the right method for the regeneration of society. He and the other Christian Socialists (see CHRISTIAN SOCIALISM) urged the adoption of Christian principles, as supplying the soundest basis for the socialistic views then coming to the front, while they promoted the cause of co-operation, as the best cure for the evils produced under the competitive system, by starting co-operative associations, and by pressing for parliamentary action in sanitary and other matters affecting the welfare of the working classes.

Kingsley's literary gifts were freely employed in various ways to point out grievances, to suggest remedies, and to give wholesome advice to labourers as well as to employers. Under the name of "Parson Lot" he contributed various articles to *Politics for the People*, a paper of which seventeen numbers were published; and to the *Christian Socialist*, a journal which was issued between Nov. 1850 and June 1851; while a pamphlet entitled *Cheap Clothes and Nasty*, 1850, appeared under the same pseudonym. To this period also belong his earliest novels, which aimed at spreading the same truths in a different form and to a larger circle. Thus *Yeast*, which appeared in *Fraser's Magazine*, 1848, raised social questions as they affected the rural population; while *Alton Locke*, 1850, described the condition of artisans in large towns. For the fearless expression of his views at this time Kingsley was frequently attacked with great bitterness, although his opinions were by no means extreme; his aim, as a reformer, was to awaken men to a sense of their duties and responsibilities, rather than to advocate measures which would deprive them of their privileges. In later life he displayed tory rather than radical tendencies, and as early as 1857, though dwelling in *Two Years Ago* on the necessity for sanitary reforms, there is a change in his attitude, induced by his own more prosperous circumstances and by the improvements which, in various ways, had resulted from the efforts of the Christian Socialists and others. His novel *Hypatia*, 1853, presents an earlier condition of society which had to face problems in some respects similar to those of his own day, while *Westward Ho!*, 1855, a story of Elizabethan times, marks his aversion to those Romish practices which seemed likely to be more widely spread as the result of the Tractarian movement. This same feeling is also reflected in his one drama, *The Saint's Tragedy*, which, though primarily describing mediæval conditions, clearly indicates his views upon current social and religious movements. In 1859 Kingsley was appointed chaplain in ordinary to the queen, and held the regius professorship of modern history at Cambridge, 1860-1869. In 1869 he was also appointed a canon of Chester, and in 1873 was preferred to a canonry at Westminster. This he retained until his death.

Kingsley was not only a conscientious parish priest, a favoured court preacher, an ardent social and sanitary reformer, a widely-read novelist, and a university professor, but also a keen sportsman, a zealous naturalist, and a poet of no mean order. The versatility and wide range of his interests led him to undertake work in many fields, while it hindered the attainment of the highest place in

any one direction; but it doubtless contributed to the widespread influence he has exercised over many different types of persons. To his teaching and example must be attributed no small share in the awakening of that increased earnestness in facing social problems which characterises the present generation.

Kingsley's works have been collected in thirty-six volumes, and include, in addition to the novels already mentioned, many volumes of children's books, sermons, lectures on history, on social and sanitary matters, on scientific matters.

[*Charles Kingsley: His Letters and Memories of his Life*, by his wife, 1877. — Hughes, T., *Memoir* in preface to *Alton Locke*, 1876. — *Life of F. D. Maurice*, by his son. — Kaufmann, M., *Charles Kingsley, Novelist and Social Reformer*.]

E. A. M.

KITE. The term "kite" serves to denote accommodation bills, when used systematically for the purpose of "raising the wind," or obtaining capital by pure credit for trading or speculation. Such transactions are frequently carried on in duplicate form, as when A draws upon B and obtains advances thereon under discount, and B draws upon A for the same purpose and to a corresponding amount. "Kiteing" has also been carried on, particularly in the United States, for obtaining the use of money even for one or two days by cross deposit of cheques for similar amounts in different banks, so as to obtain fictitious credit (see also ACCOMMODATION BILL). R. W. B.

KLOCK, KASPAR, also Glock and Glocke (1583-1655), studied law at Marburg and Cologne, and was successively one of the magistrates of Bremen and chancellor of the bishops of Minden and of the counts of Stolberg. He published collections of judicial decrees, which went through several editions, and two treatises on finance: the *Tractatus nomico-politicus de contributionibus in Romano-Germanico Imperio aliisque regnis ut plurimum usitatis* (Bremen, 1634); and the *Tractatus juridico-politico-polemico-historicus de Aerario* (1651 and 1671); "two unending, discursive, encyclopedic works, where economic, juridical, financial dissertations run along mingled up and with political, historical, and other digressions" (Ad. Wagner, *Finanzwissenschaft*, i. 33). A thorough mercantilist, most of his views are quite in keeping with mediæval practice, *e.g.* his strong partiality for fines and *amerciaments* levied on criminals, because of all taxes, "quae ad coercenda scelera imperantur," are "omnium justissima, utilissima et sanctissima." He is not, as many of his contemporaries, opposed to the extension of noble estates (*Rittergüter*), but is no friend of property in mortmain belonging to the church, and would see it entirely devoted to charitable and educational endowments.

He does not share the common admiration for the Dutch system of excise, which spread during the second half of the century; and, except in cases of urgent necessity, rejects taxation of bread and meat. His leading principle is that "all taxes ought to be proportioned to the wealth (*secundum facultatem patrimonii*) of those on whom they are imposed. Nothing but injustice can result from a want of proportion between the burden and the strength of those who are required to bear it."

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 210-217.] E. Ca.

KNIGHTHOOD, DISTRAINT OF. In the 12th century the holder of twenty librates of land (*v.* KNIGHT'S FEE) was expected to furnish a fully-armed warrior to serve for forty days in the year. In the reign of Henry III. all tenants-in-chief holding such an estate were compelled by writs issued to the sheriff to take up knighthood. Edward I. in 1278 showed his disregard of tenure by a writ enforcing knighthood upon all holders of land worth £20 a year, whether tenants-in-chief or not. Towards the end of his reign the qualification was raised to £40 a year, at which it remained. The penalty for not obeying the writ for distraint of knighthood was a fine, and such writs became in the future merely a method of raising money. The practice of issuing such writs became more and more rare, until it was revived in 1629 by Charles I., and they were strictly enforced during his eleven years of arbitrary government. The distraint of knighthood, with the other relics of the feudal system, was abolished at the restoration. R. L.

KNIGHT'S FEE. The Norman conquest introduced into England the tenure of land on military service, which is so prominent a characteristic of feudalism. At first the amount of service was not defined, but by the time of Henry II., the unit of assessment in the case of land held by military tenure was the *feodum militis* or knight's fee. This was not a fixed area of land, like the five hides which had been the qualification for thegnship (see HIDE), but was measured by the annual income derived from land. Land worth £20 a year was compelled to furnish a fully-equipped warrior to serve for forty days in the year. The extent of a knight's fee varied from two and a half to six hides. This measure was naturally the basis of SCUTAGE (see p. 510), which was a money payment in lieu of service in foreign wars. Lands held in socage were not measured by knight's fees but by hides.

[Stubbs, *Constitutional History*, i. 261-265.]

R. L.

KNIGHT'S SERVICE.

Origin, p. 508; Description of fee, p. 509; Personal Service, p. 510; Scutage, p. 510; Economic Aspects of Knight's Service, p. 510.

ORIGIN. Tenure by knight's service (*servicium militare*) is a feudal tenure by free and uncertain service. Free or honourable service consisted in attending the feudal lord to

war as opposed to base service, for example, ploughing his land. It is called uncertain because it was performed when demanded by the lord, and was not fixed in amount like the certain service of ploughing for a stated number of days or of paying rent.

In the returns to the Inquest of 1166 concerning knights' fees, quoted from the Black Book of the Exchequer by Mr. Round in the *English Historical Review*, there are instances of very early enfeoffment. For example, William de Colecherche holds by military service "de antiquo tenemento a conquestu Anglie." The holdings in Domesday are expressed in hides, not in knights' fees, but the survey was taken for the purpose of levying geld which was always assessed on the hide. The Ely History tells us that, in 1072, William I. ordered the abbots and bishops of all England to furnish to the army the forces due from them for an expedition against Malcolm, King of Scotland (*debita militæ obsequiae transmitti*): and that William II., at the beginning of his reign, exacted with harshness the *debitum servitium* imposed by his father on the churches. Long before the Conquest there was a tendency in England, from the allodial system of holding land independently and performing services as a member of the community, to the feudal system of holding by service due to a personal lord. From Alfred's time the consent of the witan to grants of bocland grew less important and the distinction between folcland and king's land less marked, so that each estate given by the king became looked upon as a grant entailing personal service to him. By the laws of Cnut (c. 77), even when estates of bocland were cut out of folcland, this land, if forfeited for cowardice in battle, became, not folcland again, but king's land. The thegn, two of whose qualifications were that he "had fully five hides of his own land" and "special duty in the king's hall," owed personal military service at his own expense, and the right of summoning the thegns belonged to the king. All this reminds us of the feudal tenant and his relation to his lord; the thegn has but to acknowledge that the five hides which give him his position are not "his own," but are held of his lord the king by the service already attached to them. Thegnage continued to exist in the north of England for centuries after the conquest. The northern thegns paid fines in commutation of personal service in Normandy in John's reign; and under the Tudors, their successors still owed military service against the Scotch for fifteen days in the year. In all these ways the English were approaching feudalism before they became the subjects of the feudal lord of Normandy.

Description of the Knight's Fee (*feodum militare*). This was the unit of assessment of the service due from a feudal tenant. A tenant-in-chief was enfeoffed by the service of furnishing to the king's army so many fully-equipped knights, this number being his *servitium debitum*. The formation of knights' fees was a gradual result of this arrangement between the king and the tenant-in-chief; for on the latter rested the responsibility of fulfilling his *servitium debitum*, and the means by which this was effected concerned only himself and the knights by whom this *servitium* was made up. Many early instances of subinfeudation, that is, of dividing the lands of a tenant into "fees" each of which furnished a knight, are found in church-lands. One reason of this is that it was a greater advantage to churchmen than to lay barons to have the fulfilment of their military service assured. The *servitium debitum*, however, did not take the place of the English military organisation. As the aid and trial by battle did not displace the geld and moot, so the *fyrd* or duty of every free man to serve, not by homage to a lord, but as a member of the community, existed side by side with knight's service. In 1138, the *fyrd* called together by the northern clergy and nobility, with Archbishop Thurstan at their head, won the battle of the Standard, and again in 1173 a Scotch invasion was repulsed by the fyrd of Yorkshire. The fyrd was re-modelled in 1181 by the Assize of Arms, which ordered every free man to bear arms. The holder of a knight's fee was to have a breast-plate, a helmet, a shield and a spear, and he who owed the service of more knights than he had enfeoffed, was to provide the same arms for these (c. 1). The Assize of Arms was enforced by Henry III. in 1252. The Statute of Winchester (1285) connected the fyrd very closely with the keeping of the peace, and directed that a view of armour should be held twice yearly (c. 6). The knight's fee usually contained an amount of land worth yearly £20, and as the value of land was not uniform, the size of a knight's fee was not everywhere the same. The normal size of a fee was four hides, each hide containing 120 acres; the five hides, which occur frequently as knights' fees, may once have been the holdings of Saxon thegns. The number of knights' fees created in England by William I. is given by Ordericus Vitalis as 60,000. Mediæval writers, however, often used 60,000 to mean simply a large number, and Stephen de Segrave, justiciary under Henry III., reduces it to 32,000. But the scutage raised under Henry II. was far too small to represent so many fees; and Alexander Swereford, compiler of the Red Book of the Exchequer, writes in 1230 of this number as "absurd and amazing," as he well might, for it would have left no English land to be held otherwise than by military service. Modern historians, have, like Swereford, put small faith

in these large numbers, and Mr. Round shows that the whole body of knights, from both the church and lay fiefs, "can scarcely have exceeded, if indeed it reached, 5000."

PERSONAL SERVICE.—Though personal service could be afterwards commuted for a fine, it was at first an essential condition of feudal tenure. The personal relationship of the feudal tenant to his lord could not be expressed more forcibly than in the oath of homage. He who, in return for his land, gave his services to his lord in the emphatic words "Ego devenio homo vester" was naturally expected to attend him in person to war, and to risk his own life in his service. Churchmen were, of course, exempt from personal service, though they held their lands from the reign of William I. as baronies, but the *servitium debitum* was due from them as from the lay barons, and quite as rigorously exacted. Under the Norman kings, feudal tenants followed the king across the sea, and foreign service was not refused until the loss of Normandy in John's reign. From this time, frequent fines "ne transfretent" appear in the Pipe Rolls to escape service abroad, and in 1297 the earls refused to go to Flanders, because, as they very clearly told the king, there was no precedent for it—"videtur toti communitati quod ibi non debent aliquod servitium facere; quia nec ipsi nec predecessores sui seu progenitores unquam fecerunt servitium in terra illa." In the charter of the same year, Edward I. pardons all knights who had not obeyed his summons to Flanders; telling them, however, at the same time, that they have incurred "rancorem nostrum et malam voluntatem" (c. 5). From Richard I.'s time, tenants sometimes paid fines to send substitutes to the army instead of obeying the summons in person. The recognised term of service for a knight was forty days in the year, and, if the duration of service would exceed this time, the king's summons was expressed in the language of a request rather than of a demand. Edward I., in his writs for continued service in the Welsh war in 1277, uses the words "affectuose rogamus," and he has to satisfy the cautiousness of the barons by promising that the lengthened term of service shall not be a precedent. In 1157, Henry II. directed that every three knights should equip one of their number for three times the term of service, and this was also done by Richard I. and John, the latter ordering nine knights to provide a tenth with 2s. a day. This reminds us of the old use in Berkshire, where, according to Domesday, holders of one hide, instead of serving themselves, paid each 4s. to send a fully-equipped warrior for every five hides (i. 56).

SCUTAGE.—Scutage was a tax levied on the knight's fee, not on the hide like the English gelds. The *Dialogus de Scaccario* says that it was so called because it was paid by those who owed the service of the shield (*quia nomina scutorum solvitur*) (i. 9). The name first appears on the Pipe Roll of 1156, when Henry II. wanted supplies with which to carry on his war in opposition to his brother Geoffrey's claims on Anjou. The rate was 20s. on a fee, and it was only levied on church lands. The Great Scutage was levied in 1159 for the war in defence of Eleanor's claim on Toulouse. It was assessed not only on church lands, but on other fees both in Normandy and England, as a commutation for personal service: the rate in England was two marks, and in Normandy sixty Angevin shillings or fifteen English. From this time the word was generally used to mean a payment in place of military service, but, unlike the English *fyrdwite*, which was a fine incurred by neglect of the fyrd, the *Dialogus* tells us that scutage was levied because the king preferred to expose mercenaries rather than his own subjects to the chances of war (i. 9). Tenants-in-chief obtained writs from the marshal "pro habendo scutagio suo," empowering them to levy scutage on their under-tenants, and they might enforce payment by distress, or procure a writ to the sheriff for that purpose. Before 1166, the scutage paid to the king was only on fees formed before Henry I.'s death (*de veteri*), but after the Inquest of that year it was levied also on new fees (*de novo*), thus cutting off the profits of those lords who had enfeoffed more knights than their *servitium debitum* required. The rate of scutage under Henry II. varied from one mark to 20s. There were three scutages in Richard I.'s reign for the wars in Wales and Normandy, and under John, who increased other taxes also, the rate was raised to two marks and scutage taken almost yearly. Magna Carta provided that it should only be levied by consent of parliament (c. 12) and by the charter of 1217 it was to be taken as in the time of Henry II. (c. 44). But Henry III. "scutagium per totam Angliam sibi fecit extorqueri," and the rate in his reign was as high as three marks. Scutage became of less importance under Edward I.; after 8 Edward II. it was sometimes levied when the king went to war in person, until Richard II. remitted it on the occasion of his fruitless expedition to Scotland in 1385. It was abolished by statute 12 Car. II. (c. 24), 1661.

ECONOMIC ASPECTS OF KNIGHT'S SERVICE.—The feudal system was not without importance as a means of increasing the revenue. There were seven "feudal incidents" connected with knight's service by which this was effected.

1. *Aids* were at first benevolences granted from a feudal tenant to his lord when there was special need for them, "de gracia et non de jure," but the three chief aids early become recognised claims of the lord on his dependant (see AID, AUXILIUM).

2. *Relief*, so called because it "incertam et caducam hereditatem relevebat," was a fine paid to the lord by the heir on succeeding to a feudal tenure. The *Dialogus* gives 100s. as the fixed amount for a knight's fee in Henry II.'s reign, but says that the relief of a barony is still settled in each case by the king (ii. 10). Magna Carta determined the relief of a barony at 100s. "per antiquum relevium" (c. 2).

3. *Primer Seisin* was the king's right to one year's profit of the lands of a tenant-in-chief if the heir was of age.

4. *Wardship.*—The lord was entitled to the wardship of the heir until he was twenty-one and of an heiress until she was fourteen years of age (raised to sixteen by Stat. of Westm. c. 22) without accounting for the profits of the estate.

5. *Marriage.*—If a feudal ward refused a suitable marriage he forfeited to his guardian the value of the marriage; that is, the sum which a jury assessed, or which would have been paid to the guardian for the marriage. If after a suitable marriage had been offered, he married without the guardian's consent, he forfeited double value—but the double value was not exacted in the case of heiresses.

6. *Fines for Alienation* were payable if a tenant alienated the land without the lord's consent. These are only found from tenants-in-chief.

7. *Escheat* was the reversion of the fief to the lord, and took place if the tenant left no heirs of his blood or was guilty of treason or felony.

The feudal incidents gave room for much oppression, for nearly every important occurrence in the tenant's life could be made an occasion for enriching his lord. All the charters and reforms issued from time to time, not before they were urgently needed by the people, were chiefly directed against the severities of feudalism. The Inquest of Sheriffs, in 1170, shows how easily Knight's Service could lead to abuses. The king had been abroad for four years, and this inquest was to inquire into the proceedings of the sheriffs and bailiffs during his absence. By the statute of *Quia Emptores* in 1290, any free man could sell the whole or part of his holding to be held by the buyer immediately of the same lord and by the same services as formerly. Before this, if a feudal tenant alienated part of his land he had still to answer to his lord for the rents and services due from the whole, and became himself the lord of the purchaser. Subinfeudation had been carried so far (we find holdings of $\frac{1}{100}$ and $\frac{1}{200}$ of a knight's fee) that the feudal dues had to be paid in some cases to many under-tenants before they reached the lord, whose profits were thus diminished: the statute of 1290 gave him a direct claim on the actual holder of his land, and it also improved the condition of the latter by removing the small owners whose lordship had been oppressive. It did not, however, apply to tenants-in-chief, who could not alienate their land until 1 Edward III., and then only by a license for which they paid a third of the yearly value of the land. Besides the three recognised aids, the under-tenants often paid their lord's debts to the Jews, and, though they are sometimes said to do so "pro bona voluntate," such very good will as this was probably only produced by the oppressions of feudalism. By Magna Carta no scutage or aids were to be taken without the consent of parliament except the three lawful aids, and these only in reasonable amounts (c. 12) and, as in Henry I.'s charter, it is expressly set forth that these reforms shall affect the under-tenants (c. 15). Further, all tenants-in-chief are to be summoned to parliament with forty days' notice before any other aid is levied (c. 14)—so carefully had experience taught the barons to guard their rights and their money against their feudal lord the king. The aid in 1168, for the marriage of Henry II.'s daughter Maud to the Duke of Saxony, the first occasion of a levy on the new enfeoffment, was at the rate of one mark on the fee; for Richard I.'s ransom in 1193, the aid was 20s. on the fee, but so large a sum was needed (£100,000) that a tax was also levied on land not held by military service; the aid granted by parliament to marry Henry III.'s sister Isabel to the Emperor was at the rate of two marks. But the amounts were not fixed until 1275, when the statute of Westminster directed that the rate should be 20s. on the fee, and that the aid should not be demanded until the son to be knighted was fifteen, or the daughter to be married seven years of age (c. 36): there could obviously be no settled rate for the aid for ransom. Edward III. levied an aid of 40s. on the fee, but without the consent of the commons, for knighting the Black Prince, in 1346. Scutage, the burden of which fell chiefly on the under-tenants, was an important contribution of feudalism to the exchequer, especially from the abolition of Danegeld in 1163 until its restriction by Magna Carta: and in Henry III.'s reign, money began to be raised by distraint for knighthood. Measures for this purpose were first taken in 1224, and in 1274 an inquiry was made into their enforcement by the sheriffs. The yearly value of land, the possessor of which had to receive knighthood or pay a fine, varied from £15 to £40, and in 1285 was as high as £100, but the normal sum was £20, the accepted value of a knight's fee. In 1278, Edward I. made knighthood obligatory on all who owned twenty librates of land, whether holding by military service or not. This measure not only increased the revenue by the fines it brought in, but also tended to break down the distinctions between the military and other tenants. The disorders and confusions of the Wars of the Roses had

the same tendency, but the feudal rents and services continued to be felt as oppressions until military tenures were finally abolished by Charles II. in the year after the restoration (Statute 12 Chas. II. c. 24).

KNIGHTS OF LABOUR. See TRADES UNIONS, U.S.A.

KNOX, JOHN J. (1828-1892), was born in New York. After engaging in private banking he entered the service of the treasury department of the United States government in 1862; in 1867 became deputy-collector of the currency; and, in 1872, comptroller. The latter position he held until 1884, when he resigned and was chosen president of a national bank in New York city. He was an earnest advocate of monometallism; and favoured the continuance of the national banking system through the establishment of a safety fund.

J. J. Knox's twelve reports as comptroller of the currency contain valuable historical material relating to state and national banks. Among these reports those of 1875 and 1876 are the most important. In 1884 he published *United States Notes* (published New York; reprint, London) a history of the issues of paper currency by the government. D. R. D.

KOPECK. One hundredth of the Russian rouble; a copper token coin. Value at present time (1905) about ¼d.

Silver coins: 50 and 25 kopecks; 900 fine, weight 154·29 and 77·15 grains. Value (English standard), 1s. 0$\frac{1}{16}$d. and 6$\frac{3}{16}$d. Also token silver coins, 500 fine, of the nominal value of 20, 15, 10, and 5 kopecks, as well as token copper coins of 5, 3, 2, 1, ½, and ¼ kopecks. F. E. A.

KOPS, J. L. DE BRUYN (1822-1887), was born at Haarlem. He studied law at Leyden, 1840-47, was an advocate at Haarlem 1851, functionary at the department of finances at the Hague 1864, professor at the polytechnical school at Delft 1868, member of the second chamber of the states-general till his death.

He was one of the founders, and for some time president, of the statistical society of Holland, for years editor of its statistical year-book, and afterwards also of its statistical abstract (1881-83). In 1852 he founded the periodical, *De Economist*, and remained its editor till his death.

His economical works are: *Grondbeginselen der Staathuishoudkunde* (Principles of Political Economy), Leyden, 1850.—*Handelscijfers: overzicht van den In-uit-en doorvoer der Nederlandsche handelsartikelen in elk der Jaren* 1846-1855 (Statistics of Trade. Summary of the Import and Transit of Dutch articles of Trade in each of the years 1846-1855), Amsterdam, 1857. His essays, treating of a variety of subjects, however, mostly appeared in *De Economist*. In general he belonged to the school of Bastiat; as to taxation he was an opponent of excise duties, especially of local ones such as the OCTROI. At a later period he eagerly combated the duty on sugar. His chief merit is that he contributed greatly to popularising political economy by his simple and intelligible style; his work, *The Principles of Political Economy*, was for some time the most generally used text-book in Holland. A. F. v. L.

KOSEGARTEN, WILHELM (1792-1868), began life as a barrister in Hamburg, but was appointed in 1839 *docent* at the university of Bonn, and in 1855 extraordinary professor of political sciences at Graetz. In his *Betrachtungen über die Veräusserlichkeit und Theilbarkeit des Landbesitzes* published in 1842, he evinces a predilection most entirely opposed to the spirit of his time for mediæval forms of payment in kind or in labour, though, according to Roscher, he successfully dispels some of the delusive fallacies of the extreme advocates of the subdivision of land. His deep-rooted aversion to what a certain German school calls *Manchesterthum* and reactionary feelings are still more conspicuously displayed in his *Geschichtliche und systematische Uebersicht der Nat. Oekonomie*, Vienna, 1856; for him, a system based on self-interest and avarice must unavoidably lead to the pauperisation of the masses. He expresses a similar bitter hatred for free competition, manufactures, railways, machinery, schemes of universal money, weights and measures, etc., and a corresponding admiration for legislation against usury and the engrossing of corn, and in favour of state industries, etc. Constitutionalism also comes in for its share of reprobation, because in the actual state of conflict between capital and labour, it is impossible for the owners of property to represent the bulk of the nation.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 1025.] E. Ca.

KRAN. See KHRAN.

KRAUS, CHRISTIAN JAKOB (1753-1807), a distinguished German economist, was born at Osterode in East Prussia. In 1770 he went as a student to the university of Königsberg, where he was in intimate relations with Kant,

von Auerswald, and Hamann, and where he became, in 1781, professor of practical philosophy and cameral science—a position which he held till his death. In later life he abandoned most of Kant's views to which he had been attached, devoted himself altogether to economics, and lectured on agriculture, manufactures, trade, and finance. He translated in 1790 the political portion of Hume's *Essays*. He was an ardent admirer of the *Wealth of Nations*, which he was the first to make known and interpret to his fellow-countrymen. Adam Müller called him a "mere echo" of Smith; he was at least his earnest disciple. In 1797 he wrote: "For the last six years, and latterly without any concealment, I have not only expanded the only true, great, noble, and beneficent system" (by which he meant Adam Smith's) . . . "but have succeeded in possessing some excellent heads with it" . . . ; and again in 1796, "Scheffner has a perfect right to say that the world has never yet seen a more important book than that of Adam Smith; assuredly, since the time of the New Testament, no work has had more beneficial effects than this will have, if it should be more widely diffused and more deeply impressed upon the minds of all who have to do with public affairs" (Seeley's *Life of Stein*, i. 409). Von Schön says —"Kraus was my great teacher; he mastered me entirely, and I followed him without reserve." "It was from Kraus," adds Professor Seeley, "that he (Schön) gained that idea of the connection of national wealth with industrial liberty, which was to be embodied partly by his exertions in the emancipating edict of Stein's ministry" (i. 375). Kraus died at Königsberg, 25th August 1807. He published little except lecture programmes; his chief influence was exerted through his oral teaching. Von Auerswald, Herbart, Süvern, and Hüllmann edited (1808-1819) his *Vermischte Schriften* in eight vols., with a biography by J. Voigt; and his *Staatswirthschaft* was published by V. Auerswald (1808-1811), and reprinted at Breslau in 1837. He advocates in these writings the removal of monopolies and restrictions on trade, the free division and alienation of landed property, and the abolition of the system of gilds.

[See J. Kautz, *Theorie und Geschichte der National Ökonomik*, ii. 621.—Roscher, *Geschichte der deutschen Nat. Oek.*, 608.—*Handwörterbuch der Staatswissenschaften*, iv. 72.] J. K. I.

KREUTZER. One hundredth of the Austrian florin; a copper token coin.

There are also silver token coins of the nominal value of 20 and 10 kreutzers, and copper ½-kreutzer pieces. In the coinage which existed all over south Germany down to 1876 the kreutzer was the sixtieth part of the florin. Since the introduction, in 1892, of the new crown currency, the coinage of kreutzers has been discontinued. The crown, which is equal in value to half a florin, is divided into 100 hellers. The new heller being, therefore, of the value of half a kreutzer. F. E. A.

KRIES, Karl Gustav (1815-1858), appointed in 1844 extraordinary professor of political sciences in Breslau, resigned his chair in 1850, and was elected a member of the Prussian house of deputies. During a journey in England, he entered into connection with the Irvingites, and became subsequently a deacon of an "apostolical" congregation in Berlin, his religious feelings giving a tinge to his opinions on the treatment of the poor, a subject which he had personally investigated in England and on which he wrote a posthumously published book, entitled *Die Englische Armenpflege* (1863). During his Silesian professorship, he had already examined the state of the spinners and weavers of that province (*Ueber die Verhältnisse der Spinner und Weber in Schlesien*, 1845), and had written still earlier a history of taxation in Silesia under the Austrian rule (*Historische Entwickelung der Steuerverfassung in Schlesien*, 1842). In a review of John Stuart Mill in Rau's *Archiv* (new series, x. 378), he utters sentiments which have since widely prevailed in Germany. "The most important task of political economy is to show how the relation of man to inanimate things, how his sentient nature, is and must be the basis and spur to his mental and moral development. Just now it ought to explain how different is an emulation tempered by considerations of justice, equity, and of the well-being of our fellow-citizens from a headlong competition only caring about self-interest."

[See Roscher, *Geschichte der Nat. Oekonomik in Deutschland*, p. 1043.] E. Ca.

KRÖNCKE, Klaus (1771-1843), a Hessian privy councillor and inspector of the Rhine, published his theories almost exclusively in the shape of algebraical formulæ. In his *Steuerwesen nach seiner Natur und seinen Wirkungen untersucht* (1804), and in his *Anleitung zur Regulirung der Steuer* (1810), he recommends for agricultural countries a single and direct tax on persons and not on things, apportioned by the fiscal authorities according to the physical and mental productive capabilities and actual faculties, whether corporal or incorporal, of each taxpayer, professional incomes being rated lower than life interests. He proposed to abolish all indirect taxes, but he would allow the taxes on industrial incomes to be adjusted so as to exert an educational influence on the national industry. "If out of ten, even only one of such attempts succeeds, the gain ought to be considered."

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 664.] E. Ca.

KRUG, Johann Leopold (1770-1843). A graduate of theology in Halle, he gave up in 1799 the ecclesiastical career in order to devote himself to statistical researches, for which he

had always felt inclined, and having attracted the attention of the king of Prussia by a pamphlet on the *Serfdom* (*Leibeigenschaft*) *of the Prussian Peasantry*, he obtained in 1800 the appointment of privy *Registrator*, which gave him access to state archives. Later on, he organised the Prussian statistical board. His *Betrachtungen über den Nat. Reichthum des preussischen Staats* (1805) are described by Roscher as one of the first attempts towards a comprehensive statistical work. His other books are: *Ideen zu einer staatswissenschaftlichen Statistik* (1807); *Abriss der Staatsoekonomie* (1808); *Geschichte der Staatswissenschaftlichen Gesetzgebung im preuss. Staate* (1808); *Geschichte der Preussischen Staatsschulden*, which, written in 1823, was only published in 1861, a long time after the author's death, on account of some disagreement with the Prussian censorship. His acquaintance with early times is rather inadequate. Krug's opinion that all indirect and personal taxation is ultimately borne by land, and his rejection of such taxes, allows him to be numbered amongst the last followers of the physiocrats.

The favourite object of his studies was assistance to the poor. Opposed to workhouses and obligatory assistance, he recommends the principle of insurance (*Die Armenassecuranz*, 1810).

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 497, and his life by Inama in the *Allgemeine Deutsche Biographie*.] E. Ca.

KURICKE, Rein (17th century), a German author,—

Wrote, in 1667, a treatise entitled *Jus Maritimum Hanseaticum* (Gottingen), and also *Diatriba de Assecurationibus* (Hamburg, 1667). The *Jus Maritimum* was reprinted by Heineccius and included in his *Fasciculus Scriptorum de Jure Nautico et Maritimo*, Halle, 1740. According to Pardessus, (*q.v.*), the *Jus Maritimum* is simply the Latin translation with a commentary of the Lubeck *recess* (or ordinance) of 1614, which became the maritime law of all the cities belonging to the Hanseatic league. Pardessus himself gives its original German text with a French translation (*Collection des Lois Maritimes*, vol. ii. pp. 528-558); in his opinion, Kuricke's long and learned commentary might usefully be reduced to a few pages (see Law Merchant). E. Ca.

LABORDE, Alexandre, Comte de (1774-1842), was born at Paris and died in the same city. This author, the son of a well-known banker to the court who perished in 1794 on the revolutionary scaffold, and the father of a distinguished archæologist, is known from an economic point of view by his work, *De l'esprit d'association dans tous les intérêts de la communauté* (1818, 8vo; 2nd ed. 1821, two vols. 8vo; 3rd ed. 1834, 8vo).

It would appear from what Laborde has written that he must have heard Adam Smith and J. B. Say spoken of; but this is about all he appears to have known of them. We must, however, recognise in this author an unaffected, honest, and unprejudiced mind. He lays weight on the importance of labour and of the value of liberty in economic matters. A. C. f.

[The work, *De l'esprit d'Association*, develops the advantages to a community of the spirit of association in all its branches: Industrial association to assist production; military association to secure possession; the advantages of credit associations; benevolent, scientific, literary associations, etc. It is interesting as marking the ideas of association current at the time before protection was advocated so strongly as has been the case since—before, on the other hand, socialism and communism were as prominent as they are now. *Dictionnaire de l'Économie Politique*, ed. Coquelin et Guillaumin.]

LABOULAYE, Edouard René Lefebvre (1811-1883), was born and died at Paris. He was perhaps rather an enlightened and determined liberal than an economist; but well read as he was in moral and political science, in history, and in law, as well as in political economy, he exercised a powerful and happy influence on the political fortunes of his country. A brilliant speaker, he knew how to impart a serious and instructive tone to his works, which were many in number and varied in character, without injury to their style. Like Alexis de Tocqueville, whom he greatly admired, he was a strong partisan of decentralisation.

Laboulaye wrote *L'État et ses Limites*, 1863, the title of which sufficiently indicates the object of the work. In *Paris en Amérique* he displayed a humorous spirit which emphasises the difference between American and European manners and customs. *La Liberté religieuse*, 1850; *Le parti liberal*, 1863; *L'histoire des États-Unis depuis les premiers essais de colonisation jusqu'à l'adoption de la constitution fédérale* (1620-1789), etc., are, as well as his *Études morales et politiques*, works from which an economic spirit is never absent, though the inculcation of political economy is not their first object. By direct statement and indirect allusion he was an enthusiastic and eloquent populariser of the science. His high-minded and loyal character was held in the highest esteem both by his opponents and his friends. He translated, or it may rather be said paraphrased, the works of Franklin and Channing.

Laboulaye was a deputy to the national assembly, and afterwards a senator for life. He occupied from 1848 onwards the chair of comparative legislation (*Legislation Comparée*) at the college of France.

Curiously enough, Laboulaye, who so well appreciated the better side of the American institutions, never crossed the Atlantic.

A. C. f.

LABOULINIÈRE, PIERRE (beginning of the 19th century), was a sub-prefect in France and Italy under the first French empire.

Laboulinière used the practical knowledge he had acquired in this capacity to write the following works:—(1) *Plan d'une statistique générale pour le Piémont* (1803); (2) *De l'influence d'une grande révolution sur l'agriculture, le commerce, et les arts* (1808); and (3) *De la disette et de la surabondance en France; des moyens de prévenir l'une en mettant l'autre à profit et d'empêcher les trop grandes variations dans le prix des grains*, 1821. Laboulinière recommended a system of *réserves à domicile* (home-stores). In years of plenty associations were to be formed, protected, and helped by the state, and local authorities were to buy corn at the market price, with the proviso that the farmer was to keep it in store until the next year of scarcity, when it was to be sold. The farmer, who had been paid in cash at the time of the purchase, was to get either a share of the profit or an indemnity proportionate to the length of time during which the corn had been stored in his granaries. E. Ca.

LABOUR. In everyday life we speak of the labour either of man or of domesticated animals (see *Wealth of Nations*, ed. M'Culloch, supp. note i.). The earlier economists too, as a rule, sought merely to interpret popular language. "The *Wealth of Nations* contains scarcely a definition" (Senior, *Pol. Econ.*, p. 5). Adam Smith in general restricts the term labour to *human* exertion, while speaking, on occasion, of "labouring cattle" (*Wealth of Nations*, bk. ii. ch. i.). He, however, departs from popular usage when he asserts that in agriculture "Nature labours along with man" (bk. ii. ch. v.). But M'Culloch, insisting on the absence of any fundamental distinction between the operations of domesticated animals, of machinery, and of nature, defines labour as including each: "any sort of action or operation, whether performed by man, the lower animals, machinery, or natural agents, that tends to bring about any desirable result" (*loc. cit.* cp. J. B. Say, *Cours Complet d'Économie Politique Pratique*, 1828-30, pt. i. ch. ix. pp. 239-40, also *Traité d'Économie Politique*, 2nd ed., 1814, bk. i. ch. vii. pp. 52-53. See Senior's criticism, *Pol. Econ.*, ed. 1872, p. 57). If, however, this be the logical outcome of popular usage, the line of thought it indicates is from the economic standpoint irrelevant. In the department of production man stands forth as, with more or less success, subjugating the rest of nature, a task in which his labour is certainly more efficient in proportion as he utilises, rather than combats, nature's forces. It is, doubtless, also more efficient the more he is aided by the capitalised labour of the past, whether that be realised in domesticated animals or inanimate machinery. Nevertheless, in the department of distribution the contrast between labour and capital is of fundamental importance. Both these distinctions M'Culloch's definition tends to obscure. Confusion in the subject matter is the natural sequence of such a wide interpretation of the term labour, just as on the other hand confusion ensues when, on the strength of an analogy indicated by Adam Smith (*W. of N.*, bk. ii. ch. i.), but valid only for certain purposes and within certain limits (see LABOUR, SKILLED). CAPITAL is made, as by Say (*Cours Complet*, pt. i. pp. 284-285, 316) and M'Culloch (*Principles*, 5th ed. pp. 294-295), to include, for general purposes, the labour power or even the person of the labourer (cp. Böhm-Bawerk, *Positive Theory of Capital*, trans. Wm. Smart, 1891, pp. 50-54). Hence most economists, to adapt the term labour to scientific use, have restricted its signification (cp. Sidgwick, *Principles*, 2nd ed. p. 51).

Again, the era of machinery, with its substitution of intelligence for strength (Marshall, *Economics*, vol. i. bk. iv. ch. ix.), has widened the popular conception of labour; still, physical exertion is the paramount idea. Scientific analysis, however, has resulted in including mental exertion also. From the economic standpoint the cabinet minister, or the *entrepreneur*, labours no less than the navvy. Hence particular discussions necessitate qualifying epithets, *e.g.* *unskilled* labour, or labour *of management*. At the same time, it appears that the extension of the conception adopted by Courcelle-Seneuil and others, and implied in the phrase "labour of saving" (*travail d'épargne*), is a departure from the ideas and language of everyday life, accompanied by no corresponding gain for the purposes of science (cp. Böhm-Bawerk on "Labour Theories" of the origin of interest, in *Capital and Interest*, Eng. trans., 1890, bk. v. p. 300 *seq.*).

Economists are, however, at one with popular usage in regarding labour as, on the whole, irksome exertion, or such as would not be undergone but for the stimulus of some ulterior aim, *e.g.* the desire to provide for present or future needs, or, it may be, to avoid the lash. (On the comparative inefficiency of the latter stimulus, see Cairnes, *The Slave Power*, 2nd ed., 1863, p. 44 *seq.*). J. B. Say's definition, "action suivie, dirigée vers un but" (*Traité*, 2nd ed., vol. ii. p. 476), is simple but too comprehensive; since, as Senior points out, it covers "a walk taken for the purposes of health, and even the exertions of an agreeable converser" (appendix i. to Whately's *Logic*, ed. 1855, p. 233). And, as the same author elsewhere remarks, "Ordinary language does not allow us to consider those undergoing labour who exert themselves for the mere purpose of amusement" (*Pol. Econ.*, ed. 1872, p. 57). High authorities,

it is true, have regarded labour as essentially disagreeable (see J. S. Mill, *Principles*, bk. i. ch. i. § i.). Jevons, however, while emphasising the painfulness of labour, admits that, when the irksomeness of beginning is over, the worker, entering into the spirit of his work, finds in it for a time an excess of pleasure; and only when he begins to grow weary does the UTILITY (*q.v.*) of labour itself again approach zero, after which the irksomeness increases, till the labourer desists when the disutility of labour equals the utility of the reward (*Theory of Pol. Econ.*, ch. v.). Labour, it thus appears, though in general a DISCOMMODITY (*q.v.*), is not universally painful (cp. Sidgwick, *Principles*, 2nd ed. pp. 37-38, 58 n.).

To sum up, labour is effort, bodily or mental, put forth by human beings, not exclusively for the sake of the pleasure immediately associated therewith, but, partly or wholly, with a view to the attainment of some ulterior object (cp. Jevons, *Theory*, 2nd ed. p. 183; Marshall, *Economics*, 2nd ed. bk. ii. ch. iii. § 2).

Senior (in appendix i. to Whately's *Logic*, ed. 1855, p. 233) asserts that "the word Labour signifies both the *act* of labouring and the *result* of that act" (see M'Culloch's criticism, that the phrase "accumulated labour" is "merely a compendious, though inaccurate, mode of signifying the accumulated products or results of labour"—*Wealth of Nations*, M'Culloch's ed. p. 435 n.). We certainly do consider labour with reference either to its internal or its external aspect,—to the mental and physical expenditure or to its productivity. The one is in no sense a measure of the other. Indeed, it is doubtful whether exact quantitative treatment is in either case possible (see *Wealth of Nations*, bk. i. ch. v.; Jevons, *Theory*, 2nd ed. 124-125, 221.; Sidgwick, *Principles*, 58 n., 92). At all events, economists have usually restricted themselves to an analysis of the determining elements of (1) intensive "quantity of labour" (see Nicholson, *Effects of Machinery on Wages* (1892), pp. 11-12, 26, 45 *seq.*, 77 *seq.*), or (2) efficiency. The latter includes, *firstly*, the causes which influence individual efficiency (see Walker, *Wages Question*, pt. i. ch. iii.; Sidgwick, *Principles*, 2nd ed. bk. i. ch. iv. §§ 4, 5), *secondly*, the nature of the organisation of labour (see Marshall, *Economics*, vol. i. bk. iv. ch. viii. to xiii.; Sidgwick, *Principles*, bk. i. ch. iv. §§ 6-8. See also DIVISION OF LABOUR; EFFICIENCY OF LABOUR; INDUSTRY, ORGANISATION OF).

Man's labour cannot produce matter but only utilities (see PRODUCTIVE LABOUR). Even thus, however, its *rôle*, as LOCKE (*q.v.*) shows, is sufficiently important. The American Indians, though they have a fruitful soil, "yet, for want of improving it by labour, have not one-hundredth part of the conveniences we enjoy; and the king of a large and fruitful territory there feeds, lodges, and is clad worse than a day labourer in England" (*Civil Government*, bk. ii. § 41.—cp. *Wealth of Nations*, bk. i. end of ch. i.). Indeed, to the labour of appropriation alone is due much that is commonly attributed to the bounty of nature (see CAPITAL, cp. Locke, *Civil Government*, bk. ii. §§ 40-43). "Labour was the first price, the original purchase money that was paid for all things" (*Wealth of Nations*, bk. i. ch. v. cp. introd. p. 1). It is, at any rate, evident that the aggregate of labour involved in the production of any commodity includes much more than that immediately concerned. To form the "strange catalogue" (Locke, *Civil Government*, bk. ii. § 43), a practically infinite regress of acts must be taken into account, many of which, however, since they enter into the final act of production in merely infinitesimal quantities, may, in practice, be neglected (cp. J. S. Mill, *Principles*, bk. i. ch. ii. § 1). For certain, though not for all purposes, the labour indirectly involved may be treated as condensed in the material and immaterial capital immediately employed (see Ricardo, *Principles*, ch. i. §§ 3, 4;—Böhm-Bawerk, *Capital and Interest*, trans. Wm. Smart, 1890, pp. 97-102, 297-300; and bk. vi., especially p. 375 *seq.*—Wieser, *Natural Value*, trans. C. A. Malloch, 1893, bk. v. ch. ix. x.).

[An exhaustive treatment of such a fundamental conception as labour would involve a discussion of many of the most vexed questions in economics. See COMFORT, STANDARD OF; POPULATION; PROPERTY; SOCIALISM; VALUE; VALUE, STANDARD OF; WAGES; and authorities cited in text.

The subject is admirably treated in Prof. J. S. Nicholson's *Principles of Pol. Econ.*, vol. i., 1893, bk. i. ch. v.] A. B. C.

LABOUR AND CAPITAL. The employment of these two terms as the antitheses of one another has for long been a commonplace of popular discussion. Disputes between capital and labour, the interests of capital, and the claims of labour, are topics familiar to every student of journalistic and periodical literature. Nor is it until the last few years that any serious doubt has been thrown in economic treatises upon the reality and appropriateness of the antithesis. The prominence, which has lately been given in those treatises to the functions of the employer in the production of wealth, and to his share in its distribution, has tended to substitute a new antithesis, for, on the one hand, trade disputes, it is seen, arise between employers and employed rather than between capitalists as such and labourers as such, and, on the other, if there be an antithesis between capital and labour, the employers, as such, may claim a place together with the employed in the ranks of labour. A group of writers, among the more distinguished of whom have been Bagehot in our own country, and General Walker in the United States of America

have shown that the employer is the moving and the guiding spirit of modern industry, organised, as it is, on the grand scale; and that he may, with the remarkable development of the banking and bill-broking system which has obtained in England and America, own but a fraction of the capital employed in his business. Accordingly capitalists may furnish him with capital, and labourers may offer to him their labour; and, if either of these two parties has a quarrel with the other, they only fight from behind the back of the employer, who has to bear the real brunt of the conflict. From this point of view, undoubtedly, the disputes, which occupy so prominent a place in popular discussion, are misnamed disputes between capital and labour, and should more properly be called disputes between EMPLOYERS AND EMPLOYED (*q.v.*). Again, recent writers on economics in England, like Professors Marshall and Sidgwick, have exhibited a disposition to consider the earnings of employers as belonging to the same genus as the wages of labourers; and although they may, making allowance for the human element involved, consider that both are determined by the same general principles as those which apply to the remuneration of capital, they have unquestionably tended to shift the antithesis from the position it has occupied in ordinary speech. For, if there be a real opposition between capital and labour, then the second member of the antithesis will include, on the arrangement of their treatises followed by these recent writers, a class which popular phraseology would certainly assign to the first. This alteration, despite the important developments of economic thought with which it is connected, and of consequences of no small pertinence to the validity of the arguments commonly employed in the discussions which have centred about the antithesis, has scarcely as yet established itself firmly even in scientific speech, and for the most part the phrase is used in its old familiar sense. It is in this sense that Mr. G. Howell, describing the history of Trade Unions, calls his book, *Conflicts of Capital and Labour*. It is in this sense that the late Mr. W. T. Thornton entitled his well-known treatise, *The Claims of Labour*. And it was largely in this sense also that Karl Marx gave the designation of *Das Kapital* to his epoch-making book; while it is certainly in this sense that many, if not most, of his numerous disciples, less acute in their economic analysis and less competent in their employment of subtle dialectic than their master, have been led into perverse interpretations of the constitution of industrial society. No doubt the employment of the term in this sense has given rise to serious misapprehension which might have been corrected by a more scientific analysis. But the employment is so stereotyped that Mr. Mallock, in a clever book on *Labour and the Popular Welfare*, is compelled to have recourse again and again to the familiar contrast, although he discerns clearly enough the fallacies it has occasioned.

It may be asked whether the antithesis between labour and capital is a reality; and the scientific answer states that it is both real and unreal. So far as the production of wealth is concerned, employers and employed are co-operating partners, and so, indeed, are labour and capital. In modern industrial society either of the two partners requires the services of the other. Nor are they merely necessary to one another, but it is their true interest that they should both be as efficient as possible. The more efficient they are, the larger will be the total amount of wealth produced; and the wealth so produced determines the absolute size of their shares in its distribution. It is the true interest, therefore, of the employers that the employed should earn sufficient wages to maintain them in the utmost efficiency of body, mind, and character; and it is the true interest of the employed that the earnings of the employer should be adequate to induce him to put forth his utmost powers in the organisation and development of his business. And similarly capital, requiring labour to co-operate with it in the production of wealth, needs as efficient labour as possible; and labour cannot dispense, without suffering for it, with capital of adequate quantity and quality. But neither efficient labour nor adequate capital will be forthcoming if it be discouraged by the smallness of its reward. So far, therefore, as the production of wealth is concerned, the interests of the two parties are harmonious, and the antithesis is unreal and misleading. But, given the production of wealth, the antithesis is strictly applicable to the distribution of the wealth so produced. Here employers and employed, and similarly capital and labour, find their interests conflict; for, the larger the share of the one party, the smaller must inevitably be the share of the other. When the older economists maintained that wages could not rise save at the expense of profits, just as when they insisted on the inelastic character of the wages-fund, they were possessed by the conception of a law of diminishing returns contracting the area of profitable employment of capital, and they did not keep continually present to their minds the possibility of increased production. Later inquiry has shown that an increase of wages, and also a diminution of the hours of the working-day, may be accompanied, if it only result in greater efficiency and a larger output, by no decrease—sometimes even by an increase—in the profits of employers and the earnings of capital. But, when once the amount of production is fixed, the possibilities of contests, bitter and protracted, over the distribution become imminent. So far,

then, as the production of wealth is concerned, the antithesis between labour and capital,—whether we interpret the phrase in the familiar sense, which would be more scientifically expressed as an antithesis between employers and employed, or whether we use labour and capital in the wider signification of agents in the production of wealth (including employers under the head of labour)—is certainly unreal; but, so far as the distribution of wealth is concerned, it is as pertinent as it is real. The scientific observer must here content himself with the sage, if ambiguous, counsel that neither party will act well or wisely for its permanent interests if it pushes any advantage it may happen to possess in the distribution of wealth so far as to affect prejudicially its production. It will then commit the error, celebrated in fable, of "slaying the goose which laid the golden eggs." But the application of this wise caution to practice is beset with so much difficulty that it may serve to restrain excess rather than to offer positive guidance. The combatants may be usefully reminded of their necessary dependence on one another, but they will not on that account be disposed to forget the inevitable opposition of their interests. Labour and capital will continue to be opposed in popular parlance; and the scientific student will be compelled to allow that the opposition has a basis in reason. The antithesis, therefore, whether the terms be used in a narrower or wider sense, cannot be said to be unreal. But it must be added that it has undoubtedly been responsible for no little amount of error. Partly this error has arisen from the particular expression given to the antithesis, and partly from mistaken ideas which have lain beneath it. Unquestionably the advocates of the claims of labour have frequently forgotten to consider the effects of the measures they support upon the production of wealth, and to remember that their constituents are equally interested with their opponents in increasing, or at least maintaining undiminished, that production. The idea of "making work by abstaining from work" is as delusive as it is attractive and popular, but it ignores the fact that production is the only source of distribution. Undoubtedly, too, it is possible that a strike may drive away a trade from a town, a district, or a country, and that the ultimate gain of a dispute may never be sufficient to compensate for the temporary loss. And, again, employers have not been always too ready to recognise the serious mischief of underpaid or degraded labour; and the history of the factory laws affords a warning, by no means unneeded, that employers—as indeed also parents and the nation at large—may at times of pressure sacrifice the permanent welfare of a country to its apparent immediate needs. Such errors as these connect themselves with an excessive emphasis laid upon the antithesis between labour and capital. Others arise from defective analysis, which the more scientific expression of the antithesis has done something to correct. The ardent hopes which were formed of the disappearance of industrial disputes with the inauguration of a system of co-operative production, connect themselves with such a faulty analysis. On the one hand, the importance of the part played by the employer, and the difficulty of discovering any effective substitute for him in co-operative management, have been slurred by the setting of capital in antithesis to labour; for it would then seem that it is only the acquisition of capital by labourers which is needed to remove that antithesis. On the other hand, a more deeply rooted fallacy lies beneath. For the antithesis is not so much between the abstractions capital and labour as it is between the concrete realities capitalists and labourers. The abstractions admit of reconciliation, but such reconciliation does not remove difficulties, which, so long as the main elements of human nature remain unaltered, must arise between men and women, capitalists and labourers. It is the individuals, and not the groups only, which are liable to quarrel, and, by setting up an antithesis between the groups as such, we are only too likely to forget the failings of the individuals who compose them. This subtle influence, which seems to attach to an abstraction, is probably responsible for another fallacy which may be noticed. It is a favourite practice with writers of a socialistic tendency, while laying immense stress on the mischievous nature of capital and the capitalistic system, and emphasising its inherent hostility to the interests of labour, to withdraw at the same time its pretended title to a useful place in the industrial economy by maintaining its original identity with labour. Out of labour it has come; and to labour its wrongful gains rightfully belong. If machinery be used in the production of wealth, it is in its origin the product of labour, and capital as such makes no contribution to that production. This reasoning, which occupies a prominent position on the pages of most socialistic treatises, is generally accompanied by a tendency to ignore, or to minimise, the functions of the employer; and in this respect it may be attributed to the faulty analysis which the altered statement of the antithesis between capital and labour has served to correct. But, as a matter of fact, while professing to insist on the antithesis, it endeavours in reality to remove its foundation. For, if capital be in its source and origin but labour, why should the two terms be opposed? The true answer is that the development of a phenomenon may be different from its origin, and may work such a change as to make it at once unreal and inaccurate to resolve the phenomenon into its primary source. In the

modern world what is known as capital is so distinct from what is known as labour that to explain the functions of the one by those of the other is to confuse and not to enlighten. It is a distortion of language and a misrepresentation of fact to argue that capital fulfils no function of its own in the production of wealth because it may ultimately have found its source in labour. The question is, what is it now, and not what it may have been a generation or more ago. The contention of the Austrian school of economists represented by Böhm-Bawerk, who regards capital as being essentially an exchange of present goods for future goods, is rarely more convincing than when its dialectic is employed in refuting that of Marx. One of the strongest reasons for the necessity of organisation to protect the interests of labour in the form of trade unions is that capital can afford to wait for the future, while labour, isolated and unorganised, cannot hold out for a reserve price, but must seek employment in the present. In this sense, then, there is a real antithesis, and it is an antithesis, not between employers (as such) and employed, but between capital and labour.

[Besides the books mentioned in the text the student may be referred to those under ARBITRATION; CONCILIATION, BOARDS OF; EMPLOYERS AND EMPLOYED; STRIKES; and TRADES UNIONS. The particular passages which should be studied in the books mentioned in the text are Walker, *Wages Question*, chs. i., xiii., xiv., and xv.—Bagehot, *Economic Studies*, pp. 52 and 53.—Sidgwick, *Principles of Political Economy*, bk. ii. chs. i., viii., and ix.—Marshall, *Principles of Economics*, bk. iv. chs. vi. and xii.; bk. vi. chs. i., ii., vi., vii., and viii.—Howell, *Conflicts of Capital and Labour*, ch. iv.—Böhm-Bawerk, *The Positive Theory of Capital* (Smart's translation), bk. ii. chs. i. and ii.—*Capital and Interest* (Smart's translation), bk. vi.—Cp. also Nicholson's *Principles of Political Economy*, bk. i. chs. v. and vi., for definitions of labour and capital.] L. L. P.

LABOUR DEPARTMENT. The development of the English labour department may be briefly traced as follows. In 1886 the board of trade was charged with the duty of supplementing, correcting, and systematising the statistics relating to labour, which had hitherto been only incidentally furnished in official reports. Mr. John Burnett, the general secretary of the Amalgamated Society of Engineers, was, accordingly, appointed to the newly-created post of "labour correspondent," and, with his assistance, the commercial department of the board of trade proceeded to draw up several volumes of wages statistics and to issue annual reports on trade unions and strikes. The services of experts also began to be engaged to furnish the board of trade with reports on special topics of industrial interest from time to time.

In 1893 the staff engaged in this work was enlarged, quartered in a separate office, and placed under the immediate control of a new official called the "commissioner for labour," and the labour department, thus equipped, undertook the task of preparing for monthly issue a journal called *The Labour Gazette*, in addition to the annual and other reports above mentioned. And, in 1896, an officer of the department was appointed to exercise the powers given to the board of trade by the Conciliation Act of that year. But the department has remained subject to the general supervision of the controller-general of the commercial, labour, and statistical departments of the board of trade, and is not represented in parliament by a special ministerial chief. Thus, factories, chemical works, and mines are inspected by the home office; the care of emigrants, seamen, and railway servants is entrusted to other departments of the board of trade; the protection of the accumulated capital of the working classes devolves on the registry of friendly societies; the superintendence of the action of local authorities as regards education, sanitation, and poor relief is divided between the education office and the local government board; while the post office, the war office, and the admiralty, and several other departments are large employers of labour. All these functions are discharged quite independently of the labour department of the board of trade.

Nor does that department, in its turn, monopolise the duty of preparing labour statistics,—a duty which is to a very large extent performed by the above-mentioned administrative departments in the course of their ordinary reports, while the task of preparing a decennial census of the occupations of the people is assigned to the general register office. Nevertheless, the labour department is doing a large amount of very useful statistical work, as illustrated by the following record of its publications during the first eight years of its existence (namely):—

"Six Annual Reports on Trade Unions" (*Parl. Papers*, c. 5104 of 1887; c. 5505 of 1888; c. 5808 of 1889; c. 6475 of 1890; c. 6990 of 1893-94, and c. 7436 of 1894).—"Five Annual Reports on Strikes and Lockouts" (*Parl. Papers*, c. 5809 of 1889; c. 6176 of 1890; c. 6476 of 1890-91; c. 6890 of 1893-94, and 7403 of 1894).—"Returns of Wages Published between 1830 and 1886" (*Parl. Papers*, c. 5172 of 1887).—"Return of Wages Paid in the Principal Textile Trades" (*Parl. Papers*, c. 5807 of 1889).—"Return of Wages Paid in the Minor Textile Trades" (*Parl. Papers*, c. 6161 of 1890).—"Return of Wages Paid in Mines and Quarries" (*Parl. Papers*, c. 6455 of 1890-91).—"Return of Wages Paid to the Police and to Persons Employed on Roads and at Gas and Water Works" (*Parl. Papers*, c. 6715 of 1892).—"Report on Wages of Manual Labour" (*Parl. Papers*, c. 6889 of 1893-94).—"Report on Sweating in the East End of London" (*Parl. Papers*, c. 331 of 1887).—"Report on Rates of Wages in Belgium" (*Parl. Papers*, c. 5269 of 1888).

—"Report on Sweating in Leeds" (*Parl. Papers*, c. 5513 of 1888).—"Report on the Condition of Nail Makers and Small Chain Makers" (*House of Commons Papers*, 385 of 1888).—"Returns of Expenditure by Working Men" (*Parl. Papers*, c. 5861 of 1889).—"Report on Profit-Sharing" (*Parl. Papers*, c. 6267 of 1890-91).—"Report on Wages and the Cost of Production" (*Parl. Papers*, c. 6535 of 1890-91).—"Two Reports on Alien Immigration from Europe to the United States of America" (*Parl. Papers*, c. 7113 of 1893-94).—"Report on Agencies and Methods for Dealing with the Unemployed" (*Parl. Papers*, c. 7182 of 1893-94).—"Two Reports on the Volume and Effects of Recent Immigration from Eastern Europe into the United Kingdom" (*Parl. Papers*, c. 7406 of 1894).—"Report on Profit-Sharing" (*Parl. Papers*, c. 7458 of 1894).—"Report on the Fishing Apprenticeship System" (*Parl. Papers* c. 7576 of 1894); and the *Labour Gazette*, London, May 1893, and monthly.

There are similar departments in the Dominion of Canada, the United States, Germany, and France. The United States and France publish a *Bulletin du Travail* monthly like our *Labour Gazette* (see BUREAU OF LABOUR, and BUREAU OF LABOUR IN THE UNITED STATES). T. G. S.

LABOUR EXCHANGE.

I. The Proposal, p. 520; II. The Scheme, p. 520; III. Labour Exchange Notes, p. 521; IV. The Principles on which Labour Notes were based, p. 522.

This term is sometimes used loosely as the equivalent of labour registry (see also BOURSE DU TRAVAIL). Accurately and historically it applies to a class of institutions which found much theoretical favour amongst early co-operators and the associates of Robert OWEN's propaganda. Numerous labour exchanges, marts, and banks flourished in England in 1832, 1833, and 1834 for the direct exchange of the products of labour according to the amount of labour expended in making them, without the intervention of money or the expenses of the ordinary machinery of distribution. Their fundamental principle was the doctrine that labour is the source of all wealth, and labour-cost the true measure of value: the operation of this principle was considered to be interfered with and distorted by the intervention of money, a monopolised and limited commodity, as a medium and essential of exchange. The exchanges met a popular requirement, and, had the constant efforts of the more clear-headed among their directors been successful in maintaining a strict commercial system of valuation, might have been long-lived. But the labour-value theory, and the conventional rating of all labour at sixpence an hour for purposes of valuation in exchange, or for labour notes, defeated these efforts. The valuation of the price of materials was also a constant difficulty. Sharp tradesmen took labour-notes in their shops, and picked out the goods in the exchanges that were saleable at a profit on their "labour value." This process accelerated the accumulation of stocks so that no one cared to take at the price of sixpence per hour for the time of their makers: the "labour-note" became depreciated *pari passu* with this depreciation of the security on which it rested; its depreciation enabled traders who took it to skim the deposits still closer, until the goods in stock, and the labour-note, had fallen to a commercial value below that which the workman of average skill could earn in the ordinary labour market in the time represented by their price, and the exchanges one by one collapsed, after furnishing a very interesting illustration to the history of theories of value.

[*The Crisis*, 1832-34.—Holyoake, *History of Co-operation.*—Noyes, *American Socialisms; Gazette of Labour Exchanges*, 1833-34.—B. Jones, *Co-operative Production* (1894), ch. viii.—*Labour Exchanges.—The Birmingham Labour Exchange Gazette.—Gazette of the Exchange Bazaars.*]

S. O.

The history of this movement may be best brought under four heads: I. *The Proposal.* II. *The Scheme.* III. *Labour Exchange Notes.* IV. *The Principles on which Labour Exchanges were based.*

I. *The Proposal.* In 1820 R. Owen wrote that there were three stages in the history of exchange: (1) barter, which admitted "the only equitable principle of exchange," which was to exchange "the supposed value of labour in one article against the amount of labour contained in any other article" ("Report to County of Lanark," *Autobiography*, ii. 278). As wealth increased, barter became impossible, and (2) artificial exchange, or exchange through some medium with a value of its own, introduced the commercial stage, which forgot "the natural standard of labour." But the increase of wealth was superseding the use of the gold and silver standard, and had partly done so during the suspension of cash payments between 1797 and 1819 (*ib.* p. 266).

(3) The third stage began when exchange would be "equitable" as in the first stage, and by means of a medium, as in the second stage. The new medium, in order to reflect without deflecting the "natural standard of value," should not possess a value of its own. What was it to be? England had solved the question in 1797 by making the new medium bank notes. The new medium was to be paper. This plan only differed from its realisation in suggesting a day-unit for an hour-unit. In 1823 he recommended "notes representing any number of "days' labour or part of a day's labour" (*Reports of Meetings in Dublin*, p. 127). "Equitable labour exchange" applies therefore to barter as well as to exchange by labour notes.

II. *The Scheme. The First Scheme* (1827-30) is often attributed to Josiah WARREN, who after assisting in the disastrous communistic experiment of OWEN at New Harmony (1825-27; for Owen's plan, see below) became an individualist. No account is obtainable of Warren's first experiment (*c.* 1828) at Cincinnati. Warren's New Harmony experiment (1842) is thus described by Macdonald: the purchaser paid *in cash* wholesale prices plus 5 per cent for general expenses and added a promise to labour for, say, the hour during which the

storekeeper attended to him; he then valued his promise in kind (or in cash?) and redeemed it accordingly (Noyes, pp. 96, 97). We do not read of the storekeeper buying with labour-notes but with cash, and in 1852 Warren said it was his rule that what was bought with cash must be sold for cash (*Equitable Commerce* by Josiah Warren, pp. 85, 91, 92, 109, etc.). The labour-notes were merely a medium for paying store servants for their trouble in kind. The only interest of the scheme is that it was a co-operative store. Warren had ulterior views no doubt, but these were to be carried out by corn-notes (*see below*).

In England, at that date "co-operative society" meant a club whose members subscribed 1s. a week or so to a "community fund," or a fund for starting an Owenite "village" in which producers should produce all that they wanted, and so turn communists; "trading associations" meant co-operative stores in the modern sense based on this community fund; and "union exchange" meant co-operative stores bought from co-operative producers. In August 1827 Dr. King grafted on "The London Co-operative Society" at 36 Red Lion Square, a "union exchange" (*Co-operative Magazine*, ii. 421), which Lovett called "The First London Co-operative Trading Association." During September, Owen, then on a flying visit to England, saw Dr. King and induced him to divide the community fund amongst the members each month. In announcing this change (1st December 1827), Dr. King wrote of his scheme as a scheme for "exchanging labour," which meant buying and selling at cost price, and as leading to everything Owen ever contemplated (*ib.* ii. 548). It is hard to see how the Owenite ideal of economical self-sufficiency could be obtained by a group of townsmen if they gave up the plan of a permanent community fund. But there was one other possible method, alliance with other groups of co-operative producers. This method was probably present to Dr. King's mind. Again on 1st October 1827 the Brighton co-operators, whose prophet was Dr. King, proposed a similar exchange union with labour-notes or "notes for the value of so much labour as is brought in" (*ib.* p. 511).

The example of London and Brighton spread through the kingdom, and we come to the *second scheme* (1829-34), whose *differentia* is the alliance of co-operative societies, in the modern sense, through labour-notes. On 13th January 1830, "The British Association for promoting Co-operative Knowledge" officially proclaimed the federal idea (London, *Co-operative Magazine*, p. 28), the idea of forming what the *Quarterly Review* of November 1829 (p. 373) called "a bazaar of co-operative shops." Owen, who had permanently returned to England in the previous August, inspired, but did not head the new departure. On 28th April 1832, the *Crisis* advertised an "exchange bazaar" in New Road, Marylebone, then the headquarters of the British Association, "on an equitable time valuation," under the signatures of Dr. King and Macpherson. According to Lovett (*Life*, p. 47), this meant labour-notes.[1] Owen, his hand being thus forced by his disciples, then published his full scheme (*Crisis*, 16th June 1832), with draft labour-notes (*ib.* 30th June), and rules (*ib.* 30th June and 8th September). Owen's "Institution"—as the headquarters of his "Association of the Industrious Classes, founded 1831," were called—was at Bromley's Bazaar, Gray's Inn Road. It had been a club for ventilating unpopular religious views, but was now quickly adapted to its new purpose. Deposits began 3rd September; exchanges, 17th September, and a branch office was opened 8th December in Blackfriars. The maximum deposits in the Bromley Bazaar reached 38,772 hours in one week, and after a month the branch office recorded 32,759 hours' deposits, 16,621 hours' exchanges (*Crisis*, ii. 7); (Holyoake writes £ for hours). The "institution" merged in the Blackfriars branch from January to May 1833, when it migrated to 14 Charlotte Street, Fitzroy Square, whence it formed a Birmingham branch which opened on 29th July and 12th August 1833 for deposits and exchanges respectively. This "institution" was by far the most important federal centre of the new movement, but while it invited non-members as well as members to deal with it, co-operative societies usually kept their organisations distinct from it. Owen undertook to absorb into it every trade, benefit, and co-operative society in the kingdom (*Crisis*, 14th April 1833), but a year later it abandoned industrial federalism (*Crisis*, 7th June 1834). In spite of this abandonment co-operative societies had been swept into the stream mainly by Owen. Pare (Owen's son-in-law) and Dr. King turned their clubs, "trading associations," and "union exchanges" into "equitable exchanges," federated throughout the length and breadth of the land, and in a year or two were nearly all engulphed (Booth says "all but four," *Robert Owen*, p. 154, but see *Working Men Co-operators* by Acland and Jones, p. 23).

III. *Labour Exchange Notes.* "This little and apparently insignificant instrument would bring prosperity to all,"—so said Owen of the *first* of the notes represented here (*Crisis*, 2nd October 1832), which bears date fifteen days after the Bromley bazaar stores were opened for Exchange. The example published in Lloyd Jones's *Life of Owen*, 2nd ed., 1895, p. 240, is marked "Birmingham Branch," has no reference to an eight hours' day (as the one given here has), but has the same pattern. "The sun of truth" recalls the titles of two Owenite newspapers, the daily and weekly *True Sun*. The beehive commemorates one of Owen's favourite fables (*Crisis*, ii. 40). The scales of justice adorn, also, J. Warren's corn-note of 1852. The note is in form a bill of exchange, and in substance a deposit-receipt, and therefore, unlike the I.O.U.'s devised by Warren, precluded credit. It was transferable in name and fact, but not in law. The *second* and *third* of these notes were obviously issued by the "London Co-operative Trading Association," and the word "central" indicates that they too were federating. There is no trace of notes actually issued by this or any other co-operative society before April 1832. E. Nash, the secretary of Owen's central association, whose name appears on the first note, often warned people against

[1] The commission charged was 8⅓ per cent = to 1d. in 1s.

notes issued by non-affiliated societies which worked on slightly different lines (*Crisis*, i. 143); perhaps this society was referred to. On 14th April 1833, "extensive premises in Red Lion Square, lately the Labour Exchange and Institution for the Working Classes," were advertised for sale; these premises were apparently referred to. *The third note* marks the point where the labour-standard degenerates into or emerges from the money standard. Owen's first draft-note (*Crisis*, 20th June 1832) also stated that "the price of labour is 6d. an hour"; but the rules explain that this superscription only meant that materials were valued thus; Warren's notes, which he suggested for general use, were as follows:—

Cost the Limit of Price.	*Seven Hours*	*Not transferable*	*7-12 pounds.*	Labor for labor.
(Figure of Justice) Justice	Due to Jacob Smith SEVEN HOURS' LABOR. In House Rent or SEVEN-TWELVE POUNDS of CORN.			

Warren's circulating medium, which he forbade to circulate, in effect substituted corn for labour, just as this third note substitutes corn or labour as the standard of value. This note is practically a bill of exchange; only a technicality of English law prevents it being regarded as such.

[Noyes, *American Socialisms.*—Benjamin Jones, *Co-operative Production* (1894), ch. viii. Labour Exchanges. For corn notes, see House of Commons' discussion, 11th and 12th June, 1822, and passages from Adam Smith and Locke cited by Western in support, and criticised by Ricardo.] J. D. R.

IV. *The Principles on which they were based.* As the ASSIGNATS (*q.v.*) were a paper currency based upon land, so Robert OWEN proposed in 1820, and his societies tried to carry out in 1832, a currency based upon labour. His labour notes were warrants issued on the strength of an hour's labour, and entitling the holder to goods from the store of the issuing exchange "to the value of one hour." Articles were to be exchanged at cost price, cost being assumed to be simply the labour spent on them. For the sake of bridging over the transition from the old currency to the new, labour was valued at 6d. an hour. Thus at the labour bank in the Gothic Hall, Marylebone, those who deposited goods at the stores were paid in labour-notes according to the value of the goods as so estimated.

For several months there was every sign of success, and some hundreds of London tradesmen agreed to take the notes in payment from their customers. The prosperity of the co-operative exchanges caused the rise of spurious rival institutions which soon forfeited the public confidence, and in the course of the year brought themselves and their models to a common ruin.

In any case no permanent prosperity could have been expected. Beginning with the error of treating all value as a matter of cost and all cost as labour, the promoters of the scheme were, besides, not equal to the task of distinguishing between the hour's labour of the skilled and industrious and the hour's labour of the unskilled or the idle. To discriminate accurately by having regard to length of training and to the ease or difficulty of the labour attested by the note would have complicated a scheme of which the most vaunted merit was its simplicity. Owen himself, too, was conscious that, especially at first, the ways and even the language of ordinary business must be preserved. But his followers, with few exceptions, were without discretion, and imposition was easy. Men brought goods that were unsaleable in the ordinary market, turned them into labour-notes, and with these notes drew useful and saleable articles from the stores. If careful valuation had been made for them by a common pawnbroker, the exchange societies might, at a small expense of dignity, have purchased a longer lease of life.

The idea of a labour note was in Owen's mind as early as 1820. In the Report to the County of Lanark, 1820 (*Life*, vol. ii. 267 *seq.*, he says that "the natural standard of value is in principle human labour," "the average of human labour or power may be ascertained; and, as it forms the essence of all wealth, its value in every article of produce may also be ascertained, and its exchangeable value with all other values fixed accordingly, the whole to be permanent for a given period. Human labour would thus acquire its natural or intrinsic value" (see VALUE, MEASURE OF).

Owen continues (*ib.* p. 278), "To make labour the standard of value it is necessary to ascertain the amount of it in all articles to be bought and sold. This is in fact already accomplished, and is denoted by what in commerce is technically termed the 'prime cost,' or the net value of the whole labour contained in any article of value the material contained in or consumed by the manufacture of the article forming a part of the whole labour." "The genuine principle of barter was to exchange the supposed prime cost of, or value of labour in, one article against the prime cost of, or amount of labour in, one article, against the prime cost of, or amount of labour contained in any other article. This is the only equitable principle of exchange," and it may be secured without sacrifice of modern improvements (p. 279), "by permitting the exchange to be made through a convenient medium to represent this value." He goes on (p. 304): "A paper representative of the value of labour manufactured on the principle of the new notes of the Bank of England will serve for every purpose of their [the association's] domestic commerce or exchanges and will be issued only for intrinsic value received and in store."

It must be said that these notes cannot fairly be compared with ordinary bank notes; they were not issued for profit or on a calculation of probable demands for payment, but simply to effect the exchange of two supposed equivalents both actually existing at the time of exchange. Over-issue was impossible, for the goods might be said to go with the notes, as with bills of lading. In theory they were always convertible. If depreciation occurred, it was because of the spread of disbelief in the possibility of carrying

out the conditions of the scheme, not from the nature of the case owing to an issue beyond the needs of the public.

[A. Held, *Sociale Geschichte Englands* (1881), i. 366-372.—Anton Menger, *Recht auf den vollen Arbeitsertrag*, 2nd ed. 1891, pp. 59, 94, cp. also pp. 89, 90, for the *Arbeitsgeld* of Rodbertus, and *passim* for parallels from later socialistic writers, with whom the idea became very popular.—The idea occurs in W. Herbert's pamphlet on *Harmony*, 1825, p. 32; and W. Thompson's *Distribution of Wealth*, 1824, p. 524.—G. J. Holyoake, *History of Co-operation* (1875), vol. i. ch. viii.—Benjamin Jones, *Co-operative Production* (1894), ch. viii. (the best short account).

Other "labour notes" besides these, appear to have existed. The following is a description of a proof of one which is preserved in a collection made by Francis PLACE, in four volumes of his, Owen's, and similar authors' writings ranging from 1817 to 1832 on *Labour Questions and Political Economy.*

At foot of the example from which this description is taken, is written, it is believed in Place's own handwriting—*discontinued.*

The "Gothic Hall" referred to, or rather depicted on the labour note described above, was in the New Road, Marylebone. It is described in an octavo page, broadside, in one of the four volumes collected by Place. The broadside says "Labour Exchange was begotten in the years 1827 and 1828,[1] but was not born until the month of April 1832, when it came into existence in the New Road, Marylebone, where it continued for some time to grow and thrive, and promised in due time to become a full grown man. But unfortunately, in the month of September of the same year, it was placed at nurse . . . in Gray's Inn Road. . . . After undergoing about four months' ignorant, experimental torture, it died, much lamented by all its real friends . . ." (Broadside is signed W. K., Charlotte Street, Portland Place, June 1835).

LABOUR IN PRISONS. See PRISON LABOUR.

LABOUR IN RELATION TO THE LAW. Under this heading it is proposed to sketch the general nature of the legal relations subsisting between wage-paid manual labourers and their employers.

Formerly, the law would not permit a workman to practise a skilled trade unless he had served a regular apprenticeship; and, in some industries, the ancient system of master, journeyman, and apprentice still survives. But, since the final repeal of the Statute of Apprenticeship (5 Eliz. c. 4) in 1814, it has been deprived of its legal sanction, and, in the larger industries, is rapidly becoming obsolete (see APPRENTICESHIP; APPRENTICESHIP, STATUTE OF).

At the present day, the nature of the legal relations between employer and workman, depending, as it does, so largely on the terms of the contract of service, varies very considerably. In the average case, however, the workmen employed in the larger and better paid industries are engaged for about a fortnight, although the contract is understood to be renewed at the end of that time, unless one or other of the parties shall have given a stipulated length of notice to terminate it. Every such contract is enforceable at law, so as to render liable to damages the employer ceasing to employ, or the workman ceasing to work without giving the stipulated notice, but not so as to enable any court to compel specific performance, or grant an injunction against a contemplated breach of the agreement. A workman leaving his employment voluntarily and without notice, cannot recover wages for the uncompleted period of service in the course of which he leaves. When summarily dismissed for no fault of his own, he can recover the full wages that would have become payable if he had received

[1] First published and recommended in No. 1 and 11 of the *Union Exchange Gazette*, and afterwards continued through the columns of the *Weekly Free Press* newspaper.

the proper notice; but, if he has been guilty of misconduct, he can only recover the wages, of which, at the date of his dismissal, payment is actually due. The types of misconduct that will justify the summary dismissal of a workman are: (*a*) dishonesty; (*b*) disobedience to lawful and reasonable orders; (*c*) habitual neglect in the discharge of ordinary duties; (*d*) drunkenness, or gross immoral conduct; and (*e*) incompetence; but, if a workman be ordered to do anything outside the sphere of the particular duties which he has expressly or by implication undertaken to discharge, he is not guilty of "disobedience to a reasonable order" in refusing to comply.

An employer can recover damages from any person who has succeeded in persuading his workmen to break their contracts with him, or in keeping them away from their work by force. He also has a right of action against any person who has employed his workmen after receiving notice of their previous engagement to work for him. He can recover from the workmen themselves the wages which their breach of contract has enabled them to earn elsewhere, and can even claim from the person who has wrongfully employed but not paid them, a sum equivalent to the value of their services. Finally, he can recover damages from any person who, by using or threatening to use violence, has deterred workmen from entering upon or renewing contracts to work for him, while any agreement that he may have made not to employ a particular workman or class of workmen is "in restraint of trade," and not enforceable against him.

Conversely, a workman can recover damages from any person who has succeeded in persuading his employer to break his contract with him, and he can even sue any person who, by threatening or using violence, has deterred him from entering upon or renewing a contract of service. Indeed, whatever may be said of an employer's freedom to choose his workmen may also be said of a workman's freedom to choose his employer.

The contract between employer and workman almost always includes a definite agreement as to wages, and from the sum agreed upon no deduction that is in contravention of the Truck Acts may be made (see TRUCK ACTS). If the wages are made payable "by the piece," the employer, being under agreement to pay them at specified periods, and not to terminate the contract without giving a stipulated length of notice, is bound to find employment for the workman between the date of the notice and the date of the termination of the contract.

An undertaking is implied on the part of the workman to conform to the general rules of discipline prevailing in the employer's service, and, so far as relates to the employer's responsibility for his workmen's personal safety, there is implied, on his part, an obligation to use due diligence to associate them with competent mates and superiors.

On leaving his employer's service, a workman cannot demand any testimonial of character. Testimonials given to him by former employers, however, are his property, although any person subsequently employing him may impair their value by writing an adverse opinion on the same paper. These "character-notes" are "privileged," and may, therefore, contain defamatory statements without exposing the writer to an action for libel. But proof of malice will destroy the privilege, and, whereas wilful falsehood proves the presence of malice, truthfulness does not prove its absence. A workman writing or uttering a false character of himself is guilty of forgery.

By the following statutes, the legal relation of employer and workman has been further defined.

The Preferential Payments in Bankruptcy Act 1888.—By this act, workmen are given priority over certain other classes of creditors in respect of the wages due to them from a bankrupt employer. Similar provisions are contained in the Companies Acts 1862 and 1867, in respect of the wages due from a company in process of winding up.

The Wages Attachment Abolition Act 1870.—This act forbids judges and magistrates to make orders for the attachment of workmen's wages.

The Truck Acts 1831 and 1887.—These acts compel employers to pay their workmen's wages in coin and in full (see TRUCK ACTS).

The Payment of Wages in Public Houses Prohibition Act 1883.—This act is, in its object, analogous to the Truck Acts.

The Employers' Liability Act 1880 *and The Workmen's Compensation Act* 1897.—These acts amend the common law of negligence as applied to the conduct of employers and workmen *inter se*, by making every employer liable, in certain specified classes of cases, for the personal injuries caused to his workmen (see EMPLOYERS' LIABILITY ACT).

The Factory Act 1901.—The primary object of this act is to regulate the conditions of labour in manufacturing establishments where "protected persons" (*i.e.* women, young persons, and children) are employed; but some of its provisions bear directly upon the employment of adult males. Among other statutes regulating the employment of protected persons, the Agricultural Gangs Act 1867; the Children Dangerous Performances Act 1879; the Prevention of Cruelty to, and Protection of Children Act 1872; and the Shop Hours Acts 1892 and 1895, may here be noticed (see FACTORY ACTS).

The Trade Union Acts 1871, and 1876, *and the Trade Union (Provident Funds) Act* 1893.—These acts have rendered the property of the associations, formed by employers and workmen for the protection of their respective interests, legitimate objects of trusts, notwithstanding that their purposes may be "in restraint of trade"; and they have exempted from income tax the portions of a trade union's funds that are set apart for provident benefits. But they have not given

trade unions the legal *status* of corporations, although they are able to sue and be sued in the courts (see TRADES UNIONS).

The Conspiracy and Protection of Property Act 1875.—This act regulates the conduct of strikes. It provides that no combination to do any act in furtherance of a trade dispute shall be indictable as a conspiracy, unless the contemplated act would be criminal if done by one individual; but it renders liable to fine or imprisonment any person who, with a view to compelling another person to do or abstain from doing any act which the latter has a legal right to abstain from doing or to do, uses or threatens to use violence towards him, persistently follows him about, hides his tools, or, except for the purpose of communicating information, besets his residence or place of work (see STRIKES and COMBINATION LAWS).

The Employers and Workmen Act 1875.—This act confers and enlarges certain jurisdictions as to disputes between employers and workmen. It enables county courts, and, in some cases, courts of summary jurisdiction—(*a*) to adjust and set off claims, whether for wages, damages, or otherwise; (*b*) to rescind contracts of service on such terms as may be just; and (*c*) with the plaintiff's consent to accept security from the defendant for the performance of so much of his contract as is unperformed, in lieu of damages. The Conciliation (Masters and Workmen) Act 1896, also makes provision for settling disputes between employers and workmen.

In addition to these statutes, there is a large mass of legislation regulating the conditions of employment in particular industries. Of this the following acts are among the most important examples. The Alkali Works Regulation Acts 1881 and 1892; the Canal Boats Acts 1877 to 1884; the Coal Mines Regulation Act 1887, and the Coal Mines (Check Weigher) Act 1894; the Cotton Cloth Factories Act 1889; the Hosiery Manufacture (Wages) Act 1874; the Merchant Shipping Act 1894; the Metalliferous Mines Regulation Acts 1872 and 1875; the Metropolitan Public Carriages Act 1869; the Quarries Act 1894; the Railway Regulation Act 1893; and the White Lead Factories and Bakehouses Act 1883.

[See Jevons, *The State in relation to Labour.*—Rumsey, *Legal Handbook for Employers and Employed.*] T. G. S.

LABOUR, MOBILITY OF. By the "mobility of labour" is meant the degree of facility with which, in response to any inducement, labourers move from one employment or place to another. For, the labour being inseparable from the labourer, "the mobility of labour and the mobility of the labourer are convertible terms" (Marshall, *Principles*, vol. i. 2nd ed., bk. vi. ch. iv. § 5).

The movement of progressive societies from status to contract (cp. Maine, *Ancient Law*, p. 170) has necessarily involved a corresponding increase in the mobility of labour. In the old VILLAGE COMMUNITIES (*q.v.*), and even now in the stationary civilisations of the East, the workers' position is, with a few "safety valves" (Bagehot, *Economic Studies*, p. 35), fixed by the rigid rule of CUSTOM (*q.v.*) (see also CASTE: FRICTION IN ECON.). Under the feudal system (see FEUDALISM), it was scarcely less rigidly fixed by "inherited and forced, rather than free, contracts" (Cunningham, *Growth of English Industry*, vol. i. (1890), p. 129, cp. *ib.* p. 5). But in modern western nations there is, to a considerable extent, freedom of movement,—most pronounced of all in the United States, the country which has broken most completely with the traditions of the ancient world. Under the modern industrial *régime*, however, so large in number, so incalculable in their operation, are the variable causes that affect the demand for the produce of any given industry or locality, and so quick the response of capital to the call of higher interest, that there is a continual tendency to disturb the relation subsisting between the supply of and the demand for labour. And, since perfect mobility is the attribute only of that mythical being, the ECONOMIC MAN (*q.v.*), labour is, during the process of readjustment, in some cases at a scarcity value, while in others its remuneration is much below the natural level (cp. Sidgwick, *Principles*, 2nd ed., bk. ii. ch. xi. § 7).

With reference to movement from employment to employment, altogether apart from impediments to mobility in its every aspect arising from legal restrictions and combinations of labourers (see APPRENTICESHIP; APPRENTICESHIP, STATUTE OF; CORPORATIONS OF ARTS AND TRADES; GILDS; TRADES UNIONS), the tendency under free competition to equality in the net advantages of different employments "in the same neighbourhood" insisted on by Adam Smith (*W. of N.*, bk. i. ch. x., beginning), is now seen to be subject to greater qualification than he was disposed to admit (see Sidgwick, *Principles*, pp. 192-193, 317-323; Walker, *Wages Question* (1886), p. 192 *seq.*). J. S. Mill speaks of the industrial society of his day as distinguishable into four grades, between which the mobility of labour was practically non-existent (*Principles*, bk. ii. ch. xiv. § 2; cp. Cairnes, *Leading Principles of Pol. Econ.* (1874), pp. 69-73). But the subsequent course of social evolution has, as Mill foresaw (*loc. cit.*), greatly loosened the bonds of custom and tradition (cp. Marshall, *Principles*, bk. iv. ch. vi. § 7). At present the chief obstacles to this "vertical movement" (Marshall) are, directly or indirectly, traceable to the unequal distribution of wealth. It is this that keeps the higher forms of labour at a "monopoly" (Mill, *loc. cit.*), or rather "scarcity" (Sidgwick, *loc. cit.*) value. The lower the grade of labour, the less able and the less willing, on the average, are parents to "sacrifice themselves for the sake of their children" (Marshall, *Principles*, bk. vi ch. iv. § 2; cp. bk. iv. ch. vi. § 7), and this obstacle is only diminished, not removed, by

the growth of morality and enlightenment, and by state-aided education. But in opposing the "horizontal movement" (Marshall), *i.e.* from one employment to another in the same grade, this cause is important only in so far as it tends to perpetuate the sway of custom, ignorance, and inertia over the poorer classes. The chief hindrance to such movement seems rather to be this, that all save the lowest forms of labour involve on the part of the workman a certain amount of technical skill and training, which is rendered useless by a change of occupation. In this connection, however, Prof. Marshall notes that the increasing use of complex machinery, calling as it does for judgment and general intelligence, rather than mere manual dexterity, tends, while accompanied by increasing subdivision of labour, to replace the former well-nigh insurmountable barriers between different employments by "thin lines of division," which are easily passed on the appearance of any considerable and lasting inducement (cp. *Principles*, bk. iv. ch. vi. § 2; ch. ix. §§ 3, 4, 5; bk. vi. ch. v. § 3).

As regards movement between different localities, that poverty and ignorance are not the only impediments in the way of such migration is clear, since "the increased facilities of locomotion, and the extended knowledge possessed by the working classes as to the conditions of life in parts outside their immediate localities," have not, within the last quarter of a century, materially increased the "migration within the borders of England and Wales" (*Census* (1891) *General Report*, p. 61).[1] It still, then, "appears evidently from experience that man is, of all sorts of luggage, the most difficult to be transported" (*Wealth of Nations*, M'Culloch's ed., p. 34). Historic legal restrictions apart (see SETTLEMENT, POOR LAW), we have here to reckon not only with the influence of marriage and the existence of family life, but also with the labourer's natural attachment to early friends and the scenes of childhood, including a feeling of reluctance, half unconscious it may be, to forsake the vicinity of the green churchyard where his forefathers sleep. In opposing the transfer of labour from one country to another, the combined influence of these motives is *à priori* more powerful; and there are frequently in this case additional drawbacks, such as difference of climate, geographical distance, and peculiarities of national character in respect of language, religion, political institutions, and modes of life (cp. Cairnes, *Leading Principles*, pt. iii. ch. i. § 2). It is this relatively greater immobility of labour, as between different nations, that is generally held to necessitate a special theory of INTERNATIONAL TRADE (*q.v.*) (see EMIGRATION).

LABOUR, SKILLED. The wealth of a nation in any given environment depends chiefly on "the skill, dexterity, and judgment with which its labour is generally applied" (*Wealth of Nations*, p. 1); or, in other words, the greater his skill the more successful, *ceteris paribus*, is man in turning the rest of nature, animate or inanimate, to the satisfaction of his wants (see EFFICIENCY OF LABOUR). But, while there are as many kinds and qualities of skill as there are varieties of mind, skill of some sort is inseparable from even the rudest forms of LABOUR (*q.v.*) (cp. Duke of Argyll, *Unseen Foundations of Society*, 1893, p. 78). There is thus no clear-cut distinction between skilled and unskilled labour. The case illustrates well the principle of continuity, the difference being in degree rather than in kind (cp. Marshall, *Principles of Economics*, 2nd ed. p. 104, Pref. p. xiii.). The distinction, moreover, such as it is, must vary from age to age and from country to country. Thus all English, and still more all American, labour is skilled in comparison with that of more backward races; and to our mediæval ancestors much of what we now regard as rude or unskilled would have seemed skilled labour; just as much of the so-called skilled labour of to-day, *e.g.* that of the copying clerk, may be

[1] The *Report* (p. 61) states that the native population shows "stationary habits of a very decided character." The percentage of "stationary natives" (*i.e.* natives of England and Wales enumerated in their native counties) was 74·04 in 1871, 75·19 in 1881, 74·86 in 1891, proportions practically identical. It is, however, noted that "the counties that retain the largest proportion of their natives are, as might be expected, those which offer the best chances of remunerative occupation."

the unskilled of future generations (cp. Marshall, *Principles*, pp. 730-732). These, however, are familiar difficulties in the way of economic classification and definition (cp. Sidgwick, *Principles of Pol. Econ.*, 2nd ed. p. 50).

What then is implied in the phrase "skilled labour" as ordinarily understood? Clearly general intelligence, foresight, energy, and honesty are qualities which, depending as they do largely on inherited race character, and on early environment and training, constitute the raw material of all industrial skill whatever—a material, too, of very various qualities in different races and individuals (cp. F. A. Walker, *Pol. Econ.*, 2nd ed. pp. 51-53). The phrase, however, as commonly used, seems to imply, in addition to this, the possession of a certain amount of technical skill—of ability specialised in some particular direction, whether it be of the faculties required in business management or for the professional work of lawyers, physicians, accountants, and such like, or the manual dexterity, the quickness of hand and eye, the technique of particular industries. Skilled labour, then, may be taken as labour differentiated, by training and experience, to such an extent that its transference to other occupations would involve, *ceteris paribus*, an appreciable industrial loss, as contradistinguished from the general mass of rude or unskilled labour, the transference of which from one occupation to another would, in this respect, involve no great sacrifice of labour power (see LABOUR, MOBILITY OF).

This acquired skill of the labourer is by Adam Smith included in the "fixed capital" of the society (see CAPITAL). It may, he says, in a noteworthy passage, "be considered in the same light as a machine or instrument of trade which facilitates and abridges labour, and which, though it costs a certain expense, repays that expense with a profit" (*Wealth of Nations*, M'Culloch's ed. p. 122). And the analogy is striking though incomplete; the motives which determine the supply of material capital do influence to a certain extent the supply of that personal capital which we term industrial skill. But the theory of EXCHANGE (*q.v.*) does not exhaust the problem of DISTRIBUTION (*q.v.*). A man's industrial skill, though partly the reward of his own effort and sacrifice, is also in great part due to the effort and sacrifice of his parents on his behalf. He who sows, acts in the full consciousness that the harvest, on its material side at least, will in all probability be reaped by another. And this fact alone—independently of the longer duration of the working life of man compared with that of a machine, and the consequently greater difficulty of forecasting future earnings (cp. Marshall, *Principles*, bk. vi. ch. v. §§ 1, 2)—suffices to differentiate to a certain extent the production of skill from that of material capital. For "the investment of capital in the rearing and early training of the workers of England is limited by the resources of the parents in the various grades of society, by their power of forecasting the future, and by their willingness to sacrifice themselves for the sake of their children" (*ibid.* bk. vi. ch. iv. § 2).

There is, however, no question that industrial development is steadily raising the ratio of skilled to unskilled labour (cp. Nicholson, *Principles of Pol. Econ.*, vol. i. 1893, p. 120). On the one hand, the growing comfort, morality, enlightenment, and forethought of the mass of the people, and a keener appreciation on the part of governments of the importance of industrial forces in determining national strength, and of the consequent urgent need of education, combine to rapidly increase the supply of trained abilities (see Marshall, *Principles*, bk. iv. ch. vi.); while on the other, the progress of science and its practical application to industrial processes, accompanied as it is by the growth of a world-wide interdependence of industry, is probably associated with an increase no less rapid in the demand for industrial skill (see DIVISION OF LABOUR; LOCALISATION OF INDUSTRY).

Machine production being specially characteristic of the present industrial era, the portion of this problem which has received most attention is the effect of machinery on skill. In the matter of the introduction of machinery, as so often in economic questions, it is necessary to carefully distinguish between the immediate and the ultimate effects of the change. The former, as experience shows, are, from the standpoint of the labourer at least, pernicious. Machinery, when introduced, depreciates the value of the labourer's only capital—his skill; for unskilled labourers, including women and children, can by its aid accomplish the task which formerly demanded the highly specialised skill and judgment of the artisan; and the amount of hardship thus occasioned will be greater the more sudden the change and the less the mobility of the displaced labour (cp. Nicholson, *Effects of Machinery on Wages*, 1892, pp. 43-44). But this is only the transitional aspect of the problem, which remains to be contemplated from the point of view of social statics (*ibid.* pp. 55-56, 83 *seq.*). Machinery once generally adopted—is the result an increase in the ratio of skilled to unskilled labour, or is the net effect the reverse of this? That the invention, manufacture, management, and repair of machinery, and the organisation and other functions consequent on the *régime* of machine production, yearly demand higher and higher forms of skill, is a truth implied in the universal recognition of the growing importance of technical education (see EDUCATION). And that this highly skilled labour is itself a steadily increasing proportion of the whole seems

probable. In favour of this view, see Marshall, *Principles*, bk. iv. ch. ix. §§ 3-6; Nicholson, *Effects of Machinery*, pp. 82-92; Giffen, *Essays in Finance*, 2nd series, 1887, Essays, ix. x. xi., cp. also *Census 1891, General Report*, p. 57 etc. Against it see Hobson, *Evolution of Modern Capitalism*, 1894, pp. 252-254. So far, therefore, the tendency of machinery would seem to be, as Professor Marshall insists, to increase the proportion of labour engaged in occupations which are at once more interesting, more intellectual, and call into play the higher forms of skill (*loc. cit.*).

A more debatable point is the influence of machinery on the skill of the machine tender—the ordinary factory hand. On the one side it is maintained that machinery, while increasing man's power over nature, and narrowing the field for muscular exertion and mere manual skill, tends at the same time to lessen the monotony of labour, and to correspondingly increase the scope for the operation of the higher mental faculties, which, too, the worker is better able to develop since his labour is less exhausting (cp. Marshall, *Principles*, bk. iv. ch. ix.). On the other side it is held that, except as regards a few industries such as watchmaking, this view is much too optimistic; that, in general, under the system of minute division of labour which accompanies the use of complex machinery — partly cause and partly consequence,—the factory hand is not properly trained to understand as a whole the operation of which his work is but a fraction (see APPRENTICESHIP); that, in consequence, his labour is monotonous and affords no scope for mental activity; that the habit of conforming to the automatic movements of the machine tends to dwarf the mind; and that, in so far as machinery lessens the need for muscular exertion and manual skill, it tends to diminish within the factory the differences in skill, reducing all to one low level (see Hobson, *Evolution of Capitalism*, ch. ix. §§ 1, 4, 5). That there is a stratum of truth in this latter or more pessimistic view need not be doubted. But it may be noted (1) that it is doubtful how far it can be reconciled with the continued preference of masters for piecework, or the increasing differences in the wages of workmen (cp. Nicholson, *Effects of Machinery*, 87-88,—Hobson, *Evolution of Capitalism*, 258-259); (2) that, as its logical outcome, we should expect to find machinery cutting wedge-like into industrial society—elevating, educating, intellectualising its few masters, degrading and brutalising its many slaves. This, it is true, was apparently the experience of Great Britain in the earlier part of this century; but the degradation of labour which then ensued was not, as experience shows, a necessary concomitant of machine production, but simply a feature of the industrial chaos which intervened between the old system of regulation and the new—between the shelving of the Statute of Apprenticeship and the gradual substitution of factory legislation (see APPRENTICESHIP, STATUTE OF; FACTORY ACTS). And, at the present time, the mental, no less than the physical and moral, degradation of labour is most pronounced in those occupations in which division of labour and the use of machinery are least conspicuous (cp. Nicholson, *Principles*, p. 120); while, as a rule, the least educative parts of factory labour are performed by those who have risen to it from even less skilled occupations (Marshall, *Principles*, p. 323). On the whole, therefore, it would seem that the effect of machinery on the skill of the machine tender will depend chiefly on the environment in which it works—on the minds with which it comes into contact. As Professor Nicholson says: "Machinery of itself does not tend to develop the mind as the sea and the mountains do, but still it does not necessarily involve deterioration of general mental ability" (*Effects of Machinery*, 80-81). It will educate only those who are prepared for it. Under its sway, general ability is, as Professor Marshall notes, becoming a relatively more important factor of industrial skill (*Principles*, pp. 265, 313-323, 607). Hence, that the worker may reap whatever benefit may be in his work, a sound general education, including a training in elementary science, is the great desideratum of the age of machinery.

But, whatever be the direct influence of machinery on the skill of the factory hand, there can be no question that the modern industrial *régime*—at once the cause and the consequence of machinery—with its large towns, interdependence of industries, and increasing complexity of life, calls for much more skill and greater intellectual activity than formerly on the part of the average citizen. The very forces, moreover, which are thus lengthening the period of tutelage, are at the same time providing the means of support during that period (cp. Giffen, *Essays in Finance*, 2nd series, 1887, p. 374, etc.); and the state prohibition of the labour of children (see CHILDREN'S LABOUR) is thus in accordance with the trend of industrial evolution.

LABOUR STATUTES originated in an attempt to remedy by legislation the dearness and scarcity of labour which followed the great

pestilence of 1349. The first great statute of labourers (23 Ed. III. st. 2) which served as the basis of nearly all subsequent legislation, ordained that able-bodied labourers of either sex "within the age of threescore years of age . . . not exercising any craft of his own whereof he may live, nor proper land about whose tillage he may himself occupy, and not serving any other," should serve any one who needed his services, and this for such wages and livery as was accustomed to be given in that neighbourhood in the twentieth year of the reign.

The penalty for refusing to work, for departing from work without license, or before the term agreed upon, or for giving alms to "valiant" beggars who refused to labour, was imprisonment. The same enactment was also applied to the labour and wages of artificers; and sellers of victuals were forbidden under heavy penalty to ask more than a reasonable price. Owing to the ineffectiveness of this statute it was re-enacted in the twenty-fifth year (st. 2, c. 1, 2) with more precise definition as to agricultural and artisan wages, which were still to remain at the standard of the twentieth year, and none for festival days (see also 4 Hen. IV. c. 14). Labourers were to serve by the year instead of by the day, and were not to leave their town if they could obtain work there. The punishment for infringement of this statute was a heavy fine, the stocks, or imprisonment of forty days for the first, and a quarter of a year for the second offence, at the discretion of the justices. The fines from the labourers were to go either to the party sueing, or if none would sue, they were to be in aid of the town's contribution to the Fifteenth (see FIFTEENTHS and TENTHS). Labourers fleeing from one county to another were to be sent to their county gaol, and this ordinance was to be observed in London as well as in all the boroughs of the land (see also 31 Ed. III. i. c. 7).

In the thirty-fourth year the penalty of imprisonment was substituted for that of fine or ransom. All alliances of workmen were to be unlawful and void; and all such leaving their service for another place were to be outlawed, imprisoned, and burnt in the forehead with an iron F in token of falsity. But this pain of burning was not to be put in execution unless by the advice of the justices.

In the thirty-sixth year the fines of artificers and labourers were to be levied to the use of the Commons. This statute was again revived in the forty-second year of Edward III., and confirmed in 2 Richard II. (1, c. 8) (repealed 5 Eliz. c. 4). By the statute 12 Rich. II. c. 3—*For the regulation of servants, labourers, beggars, and vagabonds* (repealed 21 Jac. I. c. 28; see also general words, 5 Eliz. c. 4), it was enacted that any such wandering from their place of employment without sealed letters or testimonial explaining the cause of his going and the time of his return, should be put in the stocks till he could find surety for his return. Severe penalties were imposed on the forgers of such letters, and on such as received labourers wandering without them. By this statute artificers not otherwise employed were compelled to work as husbandmen. This was confirmed by the statute of the following year (13 Rich. II.), which further ordained that the justices in quarter sessions should assess the rate of labourers' wages. By 4 Hen. IV. c. 14, labourers were not to be hired by the week, nor to take hire for holy days nor Evens of feasts. Statute 7 Hen. IV. c. 17 confirmed that of 25 Ed. III. and 12 Rich. II., concerning labourers, and further enacted that by reason of the continued scarcity of "servants of husbandry," no one who had not rent to the value of at least 20s. a year might apprentice his or her child to any craft or mystery, but only to such labour as the said parent used (in part repealed by 8 Hen. VI. 11; 12 Hen. VII. 1; and entirely by the operation of 5 Eliz. 4, § 2).

But, inasmuch as servants and labourers continued to "flee from county to county, to the great damage of gentlemen and others to whom they serve," it was decided by the 2 Hen. V. (st. 1, c. 4) that all previous labour statutes should be firmly holden and put in due execution; and as all the legislation of this period was in the landowner's interest, it is not surprising to learn that in the fourth year of the same reign the penalty for excessive wages (12 Rich. II. c. 4) was to be imposed on the taker only (expired 6 Geo. I. 11).

In the next reign, however, the justices received power to proceed against masters as well as servants, and were again empowered to regulate wages and prices (2 Hen. VI. c. 18). A similar enactment was made in the sixth, and confirmed in the eighth year, until in the 23rd Hen. VI. c. 12, we get an act for fixing servants' wages, which provided that servants of husbandry proposing to engage with a new master, must first give warning to the old, otherwise the new covenant is void, and the said servant compelled to serve his first master for a year. In this statute the wages of every kind of labourer and artificer were assigned, whether with or without food and clothing. No man was to be excused "to serve by the year upon the pain to be justified as a vagabond."

By the 11th Hen. VII. c. 22, wages were once more fixed, and in addition the hours of work and of meals for labourers were particularly defined. Notwithstanding the social and economic changes that had taken place, wages were kept rigidly at their former rate, and

the bailiff alone received a rise from his former 23s. 8d. (23 Hen. VI.) to 26s. 8d. per annum. During the summer half year the labourer was to work from 5 A.M. till 7 or 8 P.M., with half an hour allowed for breakfast, and an hour and a half for dinner and a mid-day sleep. In the winter term he was to work from sunrise to sunset. Deductions were to be made from his weekly wages for hours misspent; and a labourer assaulting his overseer could be imprisoned at the king's will. Next year, however (12 Hen. VII. c. 3), the first portion of this statute, that referring to wages, was repealed, and this fact, taken in connection with the subsequent repeal (4 Hen. VIII. c. 5) of the penalties on masters who gave excessive wages, might seem to point to a freer competition of capitalists for the services of labour, had it not been almost immediately followed by the stringent enactments of 6 Hen. VIII. (c. 3) reviving in all its rigidity the wage standard of 23 Hen. VI. c. 12. The London artisans, however, by representing the additional charges to which they were subject, obtained (7 Hen. VIII.) exemption from this statute. From the frequency with which these labour statutes were re-enacted and proclaimed, we may deduce their practical inefficiency to remedy the economic evil. But the evil itself was changing. The landowners, despairing of effectual legislative remedies, set about helping themselves. Sheep-rearing was found to pay better than corn-growing, and required far fewer working hands. The population had in the meantime increased, so that gradually it became not so much the grievance of masters who could not obtain labourers as that of labourers who were obliged to wander in search of masters. A great amount of really pressing poverty, as well as of crime and vagabondage, was the result of this state of things, and Edward VI.'s first parliament found it necessary to deal with the matter. This statute (1 Ed. VI. c. 3), for *the punishment of vagabonds and the relief of poor and impotent persons*, may be called our first poor-law. It was of a terribly harsh and repressive nature. Infant beggars might be taken as apprentices or servants—the males till twenty-four, the females till twenty years of age—and those running away from such service were to become *slaves*[1] for their remaining years of service, and might be punished with chains or otherwise. Masters might let or sell the services of such a slave or child. Slaves or slave children wounding or conspiring against their masters were to become *slaves for life*. Vagabonds were to be branded with the letter V and sent to their native parish. They might be worked on the road in gangs, with rings of iron round their necks, and could be sold by the city or borough which owned them. Impotent beggars, however, were to be provided for by their native parish. It seems, however, to have proved impossible to execute this barbarous statute, and in the 3rd and 4th Ed. VI. it was repealed, and the 22 Hen. VIII. was revived in its stead. In addition to this a more careful provision was made for the poor and impotent. The mayors of towns were to remove the sick and poor to their proper parishes, and the aged poor able to work were to be employed. Lepers and bedridden persons were allowed to beg by their proctors. Pauper children above five years of age might still be taken into service without consent of their parents, but there is no mention of chains or slavery. And, further, there is a protective clause by which the justices might discharge such children from the service of a bad master.

Elizabeth began her reign by a sanguine *Act touching divers orders for artificers, labourers, servants of husbandry, and apprentices*. This, after lamenting the inefficiency of the existing laws as to wages and hiring, which could not "conveniently, without the great greefe and burden of the poor labourer and hired man, be put in execution," repealed them so far as related to hiring and wages. The statute then goes on to decree concerning compellable service in husbandry, concerning the testimonial to be carried by wandering servants, the regulation of hours of labour, the annual assessment of wages by the justices of the peace "according to the plentie or scarcitie of the time," the penalties for giving or receiving higher wages than those so fixed, and so on, very much—for all its claims to originality—on the lines of former legislation. The last portion of it dealt exclusively with the regulations for the taking of apprentices, who were to be bound for a term of not less than seven years, and none might follow any trade or mystery to which he had not been bound apprentice for the legal term (*vide infra* 17 Geo. III. c. 33, and repealed 35 Geo. III. c. 124). But the comparative leniency of this pauper legislation proving ineffective to check the prevailing pest of rogues, vagabonds, and sturdy beggars who swarmed all over the country, recourse was, in the fourteenth year, once more had to the extremest rigour. The former statutes (22 Hen. VIII., 3 & 4 Ed. VI., and 5 Eliz.) were repealed. Persons above the age of fourteen taken begging were to be imprisoned; beggars convicted of "vagabondage" were to be "grievously whipped," and burnt through the right ear, unless some honest person of the value of £5 would take him into his or her service for a year; and the beggar quitting such service was to be whipped as above. Beggars offending a second time were to be deemed felons, and a third time, as felons without benefit of clergy. Hereupon follows a strict and detailed list of such as were to

[1] *Servi*, trans. *slaves* in Record Comm. ed. *Statutes of the Realm*. The word might be rendered *Bondmen*, yet the *Servi* had all the badges of actual slavery.

be deemed vagabonds, among which were students of Oxford and Cambridge begging without license, and play-actors who had no acknowledged patrons. Provision was to be made for the poor and impotent, and their parishes taxed for their maintenance.

The 39th Eliz. explained and revived this statute; and it was reinforced by 1 Jas. I., and heavy penalties were imposed upon those who gave less than the appointed wages.

In the 14th Charles II. c. 12, elaborate provisions were laid down for the organisation of the parish workhouses, and for the apprehension of sturdy beggars and vagabonds, who were to be compelled to work in houses of correction. Nothing, however, was herein attempted as to the assessment of wages or in respect of amelioration of the labourer's condition, although from this time onwards we meet with no more labour statutes of the harsh mediæval type. The legislature is either content, as in the present instance, to continue and pass on the work of former governments, or simply to repeal what was becoming inconvenient and obsolete.

This statute of 14 Chas. II. was renewed at various periods by 1 Jas. II. c. 17; 3 Will. & Mary, c. 11; 4 Will. & Mary, c. 24; 11 Will. III., c. 13; 6 Anne, c. 34; and, finally, made perpetual by 12 Anne, c. 18. A timidity no doubt engendered by centuries of repressive legislation restrained the labourer from seeking work far afield. To remedy this was passed, in 8 & 9 Will. III., *an act for supplying some defects in the laws for the relief of the poor of this kingdom.* This—recognising that many labourers became chargeable to their parish "merely for want of work," "who would, in any other place where sufficient employment is to be had, maintain themselves and families," and who, by reason of the difficulty of leaving their own parish, do not dare to settle elsewhere, "though their labour is wanted in many other places where the increase of manufactures would employ more hands"—enacted that labourers might change their parish, carrying with them a certificate from the place they left, and to which they were liable to be again removed in the event of their becoming chargeable.

An act, in the 22nd year of George II., providing for the more effectual preventing of frauds and abuses by persons employed in various manufactories, and for preventing combinations of workmen, and so, apparently, largely in the interest of the masters, yet also provided "for the better payment of their wages." The necessities of the improved industries also contributed to the slow emancipation of labour, for in 17 Geo. III. c. 33, we get *an act to allow master dyers within the counties of Middlesex, Essex, Surrey, and Kent, to employ journeymen in their trade who have not served apprentice thereto.* This was in contravention of 5 Eliz., which prohibited the use of certain trades to any persons who had not been apprenticed thereto for seven years at least. Similarly the hat makers, in the 55th chap. of the same act, petition for the repeal of the 5th and 8th Eliz. The 33rd Geo. III. c. 40, repealed 5 Eliz. 4, § 15, whereby justices in quarter sessions were to assess wages; the 35th Geo. III. c. 124 also repealed in favour of the wool-combers, 5 Eliz. concerning apprentices, and the statute of the 54th year c. 96 repealed for ever paragraph 31 of 5 Eliz. c. 4.

LACHES. Delay in prosecuting a right. The doctrine is laid down in the following words by Lord Camden in Smith *v.* Clay:—"A court of equity has always refused its aid to stale demands, where the party has slept upon his rights for a great length of time. Nothing can call forth this court into activity but conscience, good faith, and reasonable diligence." The doctrine is applied where a plaintiff is setting up an equitable title to land, where a plaintiff is seeking specific performance, and in other cases.

[Story's *Equity Jurisprudence*, London, 1892, gives the English and American authorities.—See also Snell's *Equity*, 14th ed. 1905, and Fry on *Specific Performance*, 4th ed. 1903. J. E. C. M.

LACROIX, EMERIC DE (in Latin CRUCEUS), born c. 1590 in Paris. Very little is known about his life, except that he published an edition of Statius and two Latin poems on Henry IV. and Louis XIII.

His *Nouveau Cynée ou Discours des Occasions et Moyens d'establir une paix générale et la liberté du Commerce par tout le monde*, Paris, 1623, shows that its author was greatly in advance of his times. To secure a perpetual peace, he recommends the institution in Venice of a permanent congress, consisting of the ambassadors of the principal sovereigns of the world, to be entrusted with the mission of settling all international quarrels by arbitration. Peace being thus secured, he urges sovereigns to repress every kind of oppression on the part of their officials, and insists on the necessity of abolishing the sale and purchase of offices. Justice should be valued higher than military courage; merchants should be honoured as being more useful than "nobles, priests, and magistrates." . . . "It is reasonable to levy small taxes on imports and exports, but this must be done with the utmost moderation,

especially for commodities which cannot be dispensed with, such as corn, wine, salt, meat, fish, wool, and leather, so that merchants may enjoy greater freedom and the inhabitants obtain them cheaper." Lacroix denies that there exists any reason "to make a distinction between the foreign and the native merchant: the conditions of trade must be equal everywhere," and he enlarges on the happiness of men who are allowed "to come and go freely, to be connected with each other without any scruple about their native country, as if the whole of the earth were, what it really is, the common city of all." He also argues for uniform coinage, weights and measures, and universal education by the state.

Lacroix was aware that his contemporaries were not ready to accept his plans, and concludes in a calm but despondent tone: "All I can do is to express these wishes and humble remonstrances, which will probably not be heeded. Still I desire to submit this testimony to posterity. If it turns out to be useless, I shall take refuge in patience."

LADING, BILL OF. See Bill of Lading.

LÆNLAND. As large estates grew up in Anglo-Saxon times, the practice developed of letting outlying portions to tenants, who cultivated but did not own the land. The rent paid for such lands might be in money, in kind, or in labour, and was sometimes a combination of all three. Some writers draw a distinction between "unbooked lænland," in which the conditions of tenure were vague and arbitrary, and terminated with the tenant's life, and "booked lænland," where the conditions were definitely laid down in writing, and the agreement might be for several terms of life. The whole subject of Anglo-Saxon tenures is so obscure, and the authorities are so scanty and of such doubtful authenticity, that it is not safe to lay down too distinct dogmas.

[*Essays in Anglo-Saxon Law* (Boston, 1876).—Kemble, *Saxons in England*, vol. i.—Kemble, *Codex Diplomaticus ævi Saxonici*.] R. L.

LA FARELLE, François Felix (1810-1872), born at Anduze, has been reproached as regretting that the ancient corporations, with their system of masters and journeymen, no longer existed, and as desiring to see the re-establishment of similar organisations. There has been a little exaggeration in this. La Farelle recognised clearly and described the defects in the organisation of labour in the 18th century throughout the whole of Europe. His work is moderate in tone. How distinctly events have moved may be seen by comparing the law of 11th March 1884 on syndicates in France with the regulations of the decree of 14th and 17th June 1791, which says (art. 2): "Citizens of the same rank or profession, contractors, those who keep open shops, workmen and journeymen of any trade whatsoever, may not, when they meet, name for themselves either presidents or secretaries or syndics, they may not keep minutes, pass resolutions or deliberate, or lay down regulations for the benefit of their supposed common interests."

La Farelle proposed to distribute officially through the agency of administrative authority all merchants, artisans, and workmen of the industrial classes and professions either in societies or in different localities. They were to be free, doubtless, either to join or to leave; the arrangement was not obligatory, it was only, at least in the towns, designed to correct through competition the faults inherent in all associations of this character. "People of the same trade seldom meet together," says Adam Smith, "even for merriment and diversion, but the conversation ends in a conspiracy against the public, or in some contrivance to raise prices." Competition alone can remedy this serious inconvenience; now the organisations of La Farelle, entirely open as they were in reference to those outside, and as he planned them absolutely free, did not allow competition, at all events in the same town. Many of the defects of the mediæval corporations would thus have been re-established.

In studying his period the works of La Farelle are still both useful and instructive. La Farelle wrote many works on workhouses and reformatories; we need only mention of these the *Progrès social au profit des classes populaires non indigentes*, 1839, 2 vols. in 8vo, which won the Montyon prize in 1840, and *Plan d'une réorganisation disciplinaire des classes industrielles de France*, preceded and followed by historical dissertations on human labour in ancient and modern times, 1842, 8vo, 2nd ed. 1847, 8vo. These two books form practically one, the first giving the plan which was ably developed in the second.

A. C. f.

LAFFEMAS, Barthélémy de (1545-1612). First a gentleman of the chamber of Henry IV. of France, he became general controller of trade. He published several tracts on the advantages which would accrue to France from mulberry-tree plantations and the breeding of silkworms, and others on commercial questions, which he viewed from the strictest stand-point of mercantilism.

Among the latter may be mentioned the *Sources des abus et monopoles glissés sur le peuple de France*, and the *Trésors et richesses pour mettre l'état en splendeur* (1598), in which he advocates, amongst other regulations, the establishment of a uniform system of weights and measures for the whole kingdom, and his *Discours d'une liberté générale et vie heureuse pour le peuple* (Discourse on a general liberty and happy life for the people), 1601.

[Pigeonneau, *Hist. du commerce de la France* (1889), vol. ii. pp. 272-278.] E. Ca.

LAFFEMAS, Isaac de, Sieur de, son of Barthélémy de Laffemas (*q.v.*), civil lieutenant of Paris and subsequently member of the council of state, wrote a *Histoire du Commerce de France* (1606), in which he follows his father's footsteps and insists on the usefulness of acclimatising the breeding of silkworms and of prohibiting the introduction of foreign silks. E. Ca.

LAFFITTE, JACQUES (1767-1844), born at Bayonne, died at Paris, was an honest man in all senses of the word. It is of him that Cormenîn said, "his private life was a living sermon." Unfortunately his too optimistic faith that everything was for the best, and perhaps a touch of vanity in his disposition, blinded him to the faults of others, and he weakly allowed himself, particularly towards the end of his life, to be imposed upon by unscrupulous persons. Hence reverses occurred which injured the reputation to which he had so high a claim. Unusually gifted as he was with the qualities which lead to success in banking business, he came to Paris, and, a little before 1789, entered the banking-house of M. Perregaux. His qualities both of heart and head made him welcome to the chief, whose son-in-law and successor he afterwards became. From this time he began to accumulate a fortune which became considerable. He was a regent of the Bank of France at the time when those events took place which led to the fall of the first empire. At this period of difficulty (6th April 1814) he was appointed provisional governor of the Bank of France. In this capacity he proposed a reform, which, had it been adopted, would have considerably improved the government of that institution. At that time the state governed, and the shareholders superintended it. Laffitte wished to appoint the directors of the Bank of France from among the shareholders, the state to be nothing more than the inspector or controller of the operations on behalf of the public interest. This useful improvement, however, was prevented by the nomination, on the 6th April 1820, of Gaudin, Duc de GAËTA, as the governor.

In 1815 Laffitte was appointed to the chamber of representatives, and from that time onwards he continually was a member of the legislative assemblies. Liberal by temperament, he freely supported a constitutional government. Hence, under the restoration he was on the side of the opposition, where he filled an important position. Loyal and cautious, he courageously braved the risk of losing his popularity by upholding measures which he considered important to the prosperity of the country, such, for instance, as the plan for the conversion of the public debt introduced in 1825 by his political adversary, M. de Villèle. Besides this, Laffitte greatly assisted in bringing about the revolution of 1830. Louis Philippe, it may even be said, owed his crown to him. The king thought he paid him sufficiently by appointing him for some months, from 2nd November 1830 to 3rd March 1831, minister of finance. Unfortunately for Laffitte, the severe crisis which broke over the country at this moment struck his bank, weakened by acts of rare generosity. The man who, during the six years he was governor of the Bank of France, had refused to accept the salary, £2400 a year, attached to that office, who had been alternately the guardian of the valuables of Louis XVIII. fleeing to Ghent, of Napoleon when he left France after Waterloo, of the Orleans family when in difficulties; the man who, in 1814, opened a subscription for a loan to carry on the war, putting his own name down for £12,000, but was alone in this; who, in 1815, advanced £80,000 to feed the army compelled to retire to the other side of the Loire, and at many other times assisted the country when in financial necessity, had to turn to the Bank of France and to the king himself to meet a claim for £600,000. Laffitte completely shielded his creditors from loss, but the support of the government of 1830 was but sparingly granted him. The gratitude of the citizen king did not blind him to his own interests. Laffitte must have reflected sadly on the want of gratitude in the public and the politicians of the time. In 1837, when seventy,—an age when men of a different stamp of character seek retirement from work,—he re-entered business life and established the Bank of Commerce and Industry, *Caisse du commerce et de l'industrie*, which was wrecked by the revolution of 1848.

He died in 1844, and was spared the knowledge of this further trouble; little as he had been appreciated in his lifetime, his funeral showed that the public was not quite indifferent to his memory.

The works which Jacques Laffitte left behind him were on financial subjects of the day. The most important is the one in which he courageously took up the question of the conversion of the public funds. *Réflexions sur la réduction de la Rente et sur l'état du crédit*, 1824, a publication which passed through several editions. A. C. F.

LAGRANGE, JOSEPH LOUIS (1736-1813). Born in Turin, but of French descent, this celebrated mathematician resided in France after the death of Frederick II., who had appointed him director of the Berlin academy. He enjoyed the steady protection of Louis XVI. and of the Emperor Napoleon.

In his *Essai d'Arithmétique Politique sur les premiers besoins de la France*, printed in 1791 by order of the *Assemblée Constituante*, Lagrange takes as the standard of the wealth of a nation the proportions between its vegetable food reduced to terms of corn and its animal food represented by butcher's meat. By three parallel estimates—grounded on the alimentary allowance of soldiers, the consumption of the towns which made returns of the quantities of food introduced, and the average annual produce of arable land and pastures—he computes that for the army the proportion between both kinds of food was as 7 to 2, for Paris 21 to 10, and for the whole of France only 15 to 2. He comes to the general conclusion that France in his days produced enough corn for its consumption, but only about half the quantity of butcher's meat which would have been requisite to put each inhabitant's allowance on the same proportion as the allowance of a common soldier.

Lagrange's *Essai* will be found in the *Collection des Principaux Économistes* (ed. Daire), vol. xiv.; *Mélanges*, pp. 608, 614. E. Ca.

LAING, Samuel (1780-1868), was the author of *Notes of a Traveller*, in which the social and political condition of many European countries is commented upon. The *petite culture* of Belgium and its system of *pauper colonies* is described accurately and carefully (see *Brit. and Foreign Rev.*, vol. xvi. (1844) p. 586; and *Dublin Univ. Mag.*, vol. xix. 1842, p. 579).

In 1836 Laing published his *Journal of a Residence in Norway during the years 1834, 1835, and 1836, made with a view to enquire into the moral and political economy of that Country, and the condition of its Inhabitants*, London, 8vo. The high praise he here bestowed upon the Norwegian method of land tenure contrasts sharply with his subsequent attack on the system of peasant proprietorship in his *Comments on the Social and Political State of the European Peoples* (1848-49), and caused J. S. Mill to remark (*Principles of Pol. Econ.*, bk. ii. ch. vi. § 3) upon his inconsistency.

Other publications were:

Preussen . . . in seiner politischen Entwickelung . . . dargestellt durch B. Constant und S. L. 1844, 8vo.—*Address to the Electors of Scotland*, Edinburgh, 1833, 8vo.—*Notes of a Traveller, on the Social and Political State of France, Prussia, Switzerland, Italy, and other parts of Europe during the present century*, London, 1842, 8vo; 2nd series, 1850, 8vo; 3rd series, 1852.—*A Tour in Sweden in 1838*, London, 1839.—*Observations on the State of Denmark and Duchies of Sleswick and Holstein in 1851*, demy 8vo, 1852.—*Observations on the Social and Political State of European People in 1848-49*, demy 8vo, 1850. A. L.

LAISSEZ-FAIRE, LAISSEZ-PASSER, History of the Maxim. Gournay is still generally credited with being the inventor of this phrase, and this apparently on the authority of his friend Turgot, who, however, in his *Éloge* of Gournay, simply says: "It ought to be added that the . . . system of M. de Gournay is remarkable in this respect, that . . . in all times and everywhere the desire of trade has been concentrated in these two words, *liberty* and *protection*, and most of all liberty. The remark of M. Le Gendre to M. Colbert is well known: "*laissez nous faire*" (Turgot, *Petite Bibl. Econ.*, p. 40, "*Il faut dire encore*," etc.). This supposed agreement of the views of Gournay with the observation of Le Gendre has been translated by Dupont de Nemours into the positive statement: "From his (Gournay's) profound observation of facts he had drawn the celebrated axiom, *laissez-faire, laissez-passer*" (*Œuvres de Turgot*, ed. Daire, i. p. 258); and has been followed by most of the writers on economic literature down to M. G. Schelle, Dupont's last biographer (*Dupont de Nemours et l'École Physiocratique*, Paris, 1888, p. 19).

In *Die Maxime Laissez Faire et Laissez Passer* (Bern, 1886), Prof. August Oncken has thoroughly sifted and examined all available evidence on this subject, and comes to conclusions which may be definitively accepted, although he has not completely succeeded in identifying Le Gendre. The latter appears to have been François Legendre, the writer of an arithmetical treatise entitled *L'Arithmétique en sa Perfection selon l'usage des Financiers, Banquiers et Marchands*, which went through nine editions between 1657 and 1687. Prof. Oncken has not been able to find out on what occasion the above reply was made to Colbert, but is inclined to believe that it must have been about 1680.

Still Legendre was a merchant and not a political writer; his answer was probably unpremeditated, and was wanting in the distinction of literary fame. In the writings of his contemporary, Boisguillebert (*q.v.*), we meet, however, sentences which are closely allied to Legendre's utterance, such as: *Il n'y avait qu'à laisser faire la nature et la liberté* (*Factum de la France*, p. 286, ed. Daire), and, *Ainsi dans le Commerce de la Vie, elle* (nature) *a mis un tel ordre que pourvu qu'on laisse faire*, etc. (*ibid.* p. 280).

The worthy Norman magistrate, Boisguillebert, would thus have been the first to use with a scientific purpose, if not the actual first half of the maxim, at least language approaching to it. After him we must come down to the Marquis d'Argenson, in order to find a distinct and clear enunciation of the same principle conveyed still more pointedly in the essay to which he gave the title of *Pour gouverner mieux, il faudrait gouverner moins* (In order to govern better, we ought to govern less) (*Journal et Mémoires du Marquis d'Argenson*, 1858, vol. v.). Here he emphatically declares that *Laissez faire, telle devrait être la devise de toute puissance publique* (*Laissez faire* ought to be the motto of every public authority), p. 364. The same line of reasoning is consistently followed, and similar expressions are used, in his *Pensées sur la Réformation de l'État* and in sundry contributions to the *Journal Économique*, the authorship of which has been brought home to D'Argenson (Oncken, *Die Maxime Laissez faire*, pp. 66-80). Neither Quesnay nor Adam Smith uses the expression, but it is printed several times in the Ephémérides du Citoyen, and now in its complete form (*laissez-faire, laissez-passer*), and constantly put into the mouth of Gournay (see quotations in Oncken, pp. 86-89). Mirabeau, Mercier de la Rivière, and Letrosne in their works give vent to the same theory, but under the parallel French or Italian form: *Le monde va de lui-même* or *Il mondo va da se* (The world goes by itself) (Oncken, pp. 84, 85). From what precedes, we may, it seems, safely conclude that if Gournay is not the actual inventor of the maxim, he put it into circulation

through his conversations, after having contributed its second half.

Although the PHYSIOCRATS had numerous contemporary adherents in Germany, the latter do not appear to have adopted the expression, unless the maxim of ISELIN (born at Basle 1728), *Lasset der Natur ihren Gang* (Let nature have her course), in his "Ephemerids of the human kind" (*Eph. der Menschheit*), be considered as an attempt towards a translation (Oncken, p. 127).

In England, J. Stuart Mill employed the actual French words *laisser faire* (but in the infinitive, not the imperative mood) in the table of contents of his *Principles of Political Economy*, as a heading to § 7 of ch. xi. E. Ca.

LAISSEZ-FAIRE IN ENGLAND.

Theory, p. 535; Legislation, p. 537.

Theory.—Laissez-faire has never been preached as an absolute dogma by any English economist, though every English economist has recognised its value in connection with certain philosophic or juristic ideas and in relation to certain definite facts. MANDEVILLE was more a philosopher than an economist; and, like Franklin, he probably advocated bounties quite as much as freedom from restraint, but his language is vague (*Fable of the Bees, or Private Vices and Public Benefits*, 1714; ed. 1772, ii. 142). The "private vices" which figure in his title consist mainly of "avarice," which he, in common with D. HUME (*Works*, ed. Grose and Green, iii. 610) and A. SMITH (*Moral Sentiments*, pt. iv. ch. i.) used to designate the desire for gain, or the economic sense (cp. Franklin's use of "to cheat," *Works*, ed. 1882, ii. 376). His "public benefits" involved such fallacies as these: "The real pleasures of all men are worldly and sensual" (ii. 118), and "Extravagance is good for trade" (*passim*). Still his writings first familiarised people with the idea that economic activity, by whatever bad names it might be called, was a far more legitimate ideal of statesmanship than the still blank perfection of the utopians. At the same time the philosophic doctrine of "the social contract" tended to reduce the functions of government to a minimum. A. Smith went to work in a very different spirit, as the chapters of the *Wealth of Nations* on the "Sovereign or Commonwealth" sufficiently show. Completing what Dudley NORTH, D. HUME, and others had begun, he exposed the unwisdom of definite instances of state intervention, such as the mercantile system, protection, apprenticeship, corporation, combination, and settlement laws. And his exposure was made at the psychological moment. He wrote, "The statesman who should attempt to direct people in what manner they ought to employ their capitals, would assume an authority which could be trusted not only to no single person, but to no senate or council whatever" (*Wealth of Nations*, 4, 2), of a society innocent of the factory system. Factory inspectors would have been an anachronism in his day. Where he pleaded for "natural liberty" every living contemporary fact echoed his plea: thus his attack on "the colonial system" was published in the year of the declaration of independence (1776), and while inveighing against monopolists, he sheltered James Watt from the persecution of the "Hammermen." And he grounded his plea on an old-world belief in the pre-established harmony between selfish impulses and the aims of society, meeting the objection that "natural liberty" led to an unjust distribution of wealth by the reply that wealth was not happiness (*Moral Sentiments*). In the next generation (1817) RICARDO's language created, although it did not justify (Marshall's *Principles*, 553), the fallacy that unrestricted competition was the best and only principle regulating the distribution of wealth—a fallacy which Mill dissipated in 1848 by showing that it confused a hypothesis or at best a tendency with a natural law. Similarly Sir J. Bowring represented the current inferences drawn from BENTHAM's writings when he wrote in his Introduction (p. 77), that "the preservation of security is *all* that political economy looks to from the legislature, security for wealth created, security for the exercise of ingenuity and industry in creating more, security for enforcing the performance of contracts." Yet Bentham arrogated to government (1) coinage and the restriction on the issue of notes adopted in principle in 1844; (2) the duty *e.g.* of improving communication where profit was certain, but it was uncertain who would profit (*Manual of Political Economy*, ch. iii. § 2, note); (3) the duty of providing information by registries of births, tenures, etc.; (4) of promoting education and health—thus CHADWICK, the father of English sanitary legislation, was Bentham's disciple. Indeed it cannot be said that Bentham's rule that government must "stand out of the sunshine" of industry (*ib.* ch. i.) was subject to the sole reservation that government must fix "the mechanism of exchange in order that the forces of society may act freely," unless mechanism and exchange are used in a wide sense. Meanwhile the most visible results of Bentham's and Ricardo's influence were the abolition of combination and usury laws, and of those poor-law regulations which had made it people's interest to add to poverty. A new generation passed. FREE TRADE sealed the triumph of the policy of "adding wings by striking off fetters"; and men forgot that the champion of free trade who wrote, "Wherever the deductions of political economy lead I am prepared to follow" (Morley's *Cobden*, 2, 97), wished to forbid the supply of money when

demanded by the biggest customer in the money market, for reasons which many people thought sentimental, but which he thought involved the first principles of morality (*ib.* 69 n.). Darwin's *Origin of Species* (1859) was suggested by the work of an economist, MALTHUS, and furnished a wider basis for blind belief in competition than that which economists claimed. A Benthamite might argue that the state should define "tenancy" as a right of property including the right to game, compensation for improvements, etc., just as it defines "mortgage" as a right of property including the right to redeem; but students of Maine's *Ancient Law* (1861) stigmatised such definitions as a retrograde substitution of status for contract. H. Spencer blended references to the old poor-law with his curious identification of Maine's new principle with A. COMTE's old principle of industrialism ousting militarism (*Contemporary*, xl. 512, 513, etc.). His conception of the duty of the state towards industry is practically that expressed by Sir J. Bowring (*v.s.*); and since 1853 (*Essays*, ed. 1891, vol. iii. pp. 229-471; *Man versus The State*, 1884; Introduction to T. Mackay's *Plea for Liberty*, 1891) he has unceasingly urged that "positively-regulative" acts are either (like the Licensing and Banking Acts) gratuitous and ineffectual blunders, or else (like the Adulteration of Food and Metropolitan Building Acts) blunders intended to counteract, but actually intensifying, the evils arising from its "negatively-regulative" shortcomings. Professor Huxley's phrase "administrative nihilism" describes his wishes if not his practical views. Further expression was given to these intellectual tendencies in R. LOWE's speeches against land reform in Ireland (Hansard, 183, p. 1078; 190, pp. 1483, 1493, etc.) and in Bonamy PRICE's application of "the principles of *abstract* political economy to the people and circumstances of Ireland exactly as if he had been proposing to legislate for the inhabitants of Saturn and Jupiter" (Gladstone's speech, April 7, 1881). The first note of revolt against this new tendency was sounded in 1862 by Cliffe LESLIE who was as much influenced by Maine as J. S. MILL was by Austin or RICARDO by BENTHAM; but he had seized his master's concrete method instead of misappropriating his results (*Essays in Political Economy*, Nos. 1, 3, and 15). CAIRNES was at this very time proving the failure of competition to act freely in regard to retail trade or where there were "non-competing groups"; and supported in the *Fortnightly* for January 1870 a proposal which anticipated that very Irish land law of 1881 which, according to a misquotation of Mr. Gladstone's speech, banished political economy to Saturn and Jupiter (*Essays in Pol. Econ.*, p. 203). In the same year his address on political economy and *laissez-faire* relegated the latter to the rank of a fairly sound maxim (*ib.* 232). BAGEHOT laid down (1876) the principle that political economy established conclusions only applicable to exceptional and artificial conditions of society such as obtained in certain industries existing in England at that date (*Fortnightly*, xix. 218, 226, etc.). JEVONS wrote in 1876 that it was all very well for industry to ask the state to stand out of its sunshine, but what if it was already an industry which stood in the sunshine of other industries? (*ib.* xx. 629), and suggested the extension of the Artisans' Dwellings Act 1881 (*ib.* 630). He had already declared that experience might, but "no abstract principle can, guide us in determining what kinds of industrial enterprise the state should undertake and what it should not," and urged in 1867 the state monopoly of telegraphs established in 1868 (*Manchester Statistical Society Trans.*, April 1867, p. 9). Walker's *Wages* (1876) emphasised the truth, mixed with fallacies in THORNTON's book on *Labour*, 1869, that the conditions of fighting between employers and employed are unequal, the former fighting for profit, the latter for life, and that the labourer brings himself into the market, this same self being the object for which, as well as a means by which, wealth is produced. The modern view that self-interest acts with infinitely varying degrees of force in different cases is enlarged upon in Sidgwick's *Principles*, bk. iii. (1901), and TOYNBEE's *Industrial Revolution*, (1884); the latter writer holds "that between men who are unequal in material wealth there can be no freedom of contract" (p. 216), and is also dominated by the idea expounded in Professor Green's *Free Contract* (Writings, iii. 365) that personal and patriotic considerations enter with peculiar force into labour and land questions, and that negative is only the handmaid of positive freedom. These writers all agree in their general direction, but differ in their application of their principles. For instance, Jevons wrote that "an eight hours *bill* is in no way an illegitimate object to keep in view" (Lecture on the *Trades Unionists' Political Association*, 1868); Fawcett only approved of this movement for shortening hours of work provided that it repudiated state intervention (Hans. 219, p. 1421). Again Cliffe Leslie attacks, Jevons and Bagehot defend, the use of the expression "Law" to describe the operation of competition. All, however, unite in condemning legislation to determine wages, though all would not approve of Fawcett's simile "we might as well think of regulating the tides by act of parliament" (*ib.*). And, secondly, all condemn the regulations, which have the force of law, for restricting production and making unnecessary work, which have in so many cases been adopted by

TRADES UNIONS, and which seem copied from mediæval legislation or guild rules. Thirdly, all agree that where wages are compulsorily raised, *e.g.* by a strike, this means either that "the operation of economic conditions" is being, in Cairnes's phrase, "accelerated," or that the consumer is being taxed, a process which is protection, and therefore open to those arguments against protection which no English economist has renounced (Cairnes, *Leading Principles*, pt. 2, ch. 3, etc.). Strike leaders used to justify their action on the former ground, or, as they put it, on the ground that profits were too high; the leaders of the coal strike of 1893 adopted the latter grounds. It cannot, therefore, be said that the adverse criticisms formerly passed by economists on the intervention by political bodies in industries are out of date; these adverse criticisms or *laissez-faire* arguments first made economists a force in the state, and they are as valid now as when they were first used. On the other hand economists realise that negations are only a part of their message, and the easiest part to understand and to translate into practice. Indeed, it is probably the only part in which their science can be treated as an art, and they can have recourse to the imperative mood. "Trade never so well freed, and all tariffs settled or abolished, and supply and demand in full operation, we have merely cleared the ground for doing" (*Past and Present*, p. 159). Hitherto they have, like J. D. HUME, opposed; or, like Mill and Fawcett, partly opposed and partly apologised; or, like Cobden, have not voted, where constructive industrial legislation, *e.g.* the FACTORY ACTS, was concerned. The later economists have adopted a different tone, but have only displayed the unanimity which we expect from historians or philosophers, not that which we require from people entitled to apply their ideas to real life (see GOVERNMENT REGULATION OF INDUSTRY).

J. D. R.

Legislation.—Recent laws interfering with free industry may be classed under three heads:—

First, there are the laws gradually extending principles laid down in earlier legislation, such as—

(*a*) The laws relating to town life. These laws were first consolidated by the Towns' Improvement Clauses Act 1847, and The Public Health Act 1848; the latter is now superseded by The Public Health Act 1875. Amending acts and local acts are also numerous. Consolidated laws relating to London were first made in 1844, and lastly in 1891. All these laws are lineally descended from the act passed for rebuilding London after the great fire (19 Car. II. c. 3), which contained provisions for paving and drainage, for the height and materials of houses, for prohibiting "noisome trades," for compulsorily taking land in order to widen streets, and for enforcing all this by means of commissioners, surveyors, and summary judicial proceedings. One of the acts amending the parent act contained power to pull down dangerous dwelling-houses at the cost of the owner (33 Geo. II. c. 30, § 26). The modern versions of these provisions extend the definition of "dangerous dwelling-houses" so as to include the danger arising from over-crowding, living in cellars, etc., and extend the scope of the sanitary provisions to populous places or even the country (Public Health Act 1872), and powers are given to destroy food exposed for sale and unfit for food. (i) A singular offshoot of the law against dangerous dwellings is the series of Housing of Working Classes Acts consolidated and amended in 1890 (53 & 54 Vict. c. 70). Under this act, where unhealthy or obstructive areas or dwellings are pulled down, the local authority can buy the site and erect and manage labourers' dwellings.[1] The power to buy land and erect labourers' dwellings was borrowed from the Labouring Classes' Lodging Houses Act 1851 (§§ 35 *et seq.*), which had up till then remained a dead letter. Similar provisions contained in the Artisans' and Labourers' Dwellings Improvement Act 1875 took away with the left what they gave with the right hand. So that the act of 1890 is substantially new. Its amendment in 1903 is unimportant. (ii) Still more singular is the development of the law against unhealthy food. It united itself with the act against the "adulteration of bread" (6 & 7 Will. IV. c. 37) which replaced the Assize of Bread Acts (51 Hen. III. to 55 Geo. III. c. 99), and the result of the union was the 6th section of The Sale of Food and Drugs Act 1875, which makes a person criminally responsible who sells "to the prejudice of the purchaser any article of food or any drug which is not of the nature, substance, and quality of the article demanded by such purchaser,"-§ 6, except in a few cases. Public analysts assist in the detection of offenders. (iii) Municipalities can erect, buy, and manage baths and wash-houses since 1846[1] (9 & 10 Vict. c. 74). The local government board superintends the administration of all these acts.

(*b*) Shipping laws, including the wage-law of sailors, were first consolidated in 1854 (17 & 18 Vict. c. 104). The chief innovation of this law was that it gave the board of trade wide powers of supervision and control over the construction and safety of ships, over the grant of certificates to captains, and over the mode of paying wages, etc. The Passengers Act 1855 contained provisions as to the number and accommodation of passengers; and the Merchant Shipping Amendment Act 1871, as to the draught of the ship when loaded; these provisions, which have been gradually added

[1] Here a public body directly competes with private industries.

to, may be regarded as corollaries from the provisions as to "safety" in pt. iv. of the act of 1854. But § 168 of the last consolidating act (The Merchant Shipping Act 1894) borrows from 43 & 44 Vict. c. 16 a principle which finds no parallel in earlier acts, although it was foreshadowed by Lord Stowell's argument that no contractual freedom obtains between master and man (1 Haggard's Adm. Rep. 355). It enacts that the court can rescind unjust and substitute just terms in the contract between master and man; that is to say, the court can settle the amount of wages.[1]

(*c*) The prohibition to pay wages in kind, which dates from the middle ages, was for the first time extended to agricultural labourers, for certain purposes, and other labourers by the Truck Amendment Act 1887 (see TRUCK SYSTEM).

(*d*) The General Post Office, which acquired its monopoly of carrying letters by 12 Car. II. c. 35, acquired a telegraph monopoly under 31 & 32 Vict. c. 110. Its issue of postal orders (under 3 & 4 Vict. c. 96, § 38), and its savings banks (24 & 25 Vict. c. 14), imply an assumption on its part of the rôle of poor man's banker, and represent a new departure.[2]

Secondly, there are the laws directly arising out of new inventions which have changed the face of society.

Thus (*a*) railways had to create their lines by means of compulsory purchases (see Lands Clauses Consolidation Act 1845), and they subjected themselves, in return, to certain disabilities (see Railway Clauses Consolidation Act 1845), the chief disability being that of having to run cheap trains, and of having their maximum rates fixed and, in case their concern was a success, revised from time to time by government (7 & 8 Vict. c. 85).[1] The authorities exercising jurisdiction over these matters are under the Railway and Canal Traffic Acts 1888 to 1894, partly the board of trade and partly the railway and canal commissioners. It is easy to see how a maximum rate might in many cases mean the same thing as the actual rate. Thus bye-laws under the Town Police Clauses Act 1847, and the provisions of the Metropolitan Stage and Hackney Carriages Act 1853, perhaps suggested by railway law, fixed the actual fare for cabs.[1] It is also to be noted that the provision for penny-a-mile fares in the act of 1844 (7 & 8 Vict. c. 85, § 6) has developed into The Cheap Trains Act 1883, under which the board of trade and railway commissioners have to be satisfied of the accommodation provided at this rate, and of the adequacy of provision for cheap workmen's trains. The limits within which they exercise their discretion are not defined.[1]

1 Here the state regulates prices.
2 Here the state directly competes with private industries.

(*b*) The rise and progress of the FACTORY ACTS (1802-1902) is traced elsewhere.

Thirdly, there are laws dictated by a new social policy with regard to old social conditions.

(*a*) The Elementary Education Act 1870 authorised the use of compulsion to make parents send their children to school. The compulsory clauses have been more and more enforced, especially under the Amending Act of 1880.

(*b*) Commissioners appointed by government have since The Land Law (Ireland) Act 1881 fixed the rents of Irish tenants, and since the Crofters' Holdings (Scotland) Act 1886 of Scotch "crofters."[1] The Irish act was extended to lessees by the Land Law (Ireland) Act 1887.

(*c*) The Allotment Acts 1832-1882 enabled local authorities to hold, hire, and enclose land for the purpose of letting it to industrious cottagers. These acts were chiefly if not exclusively applied for the purpose of restoring to the poor land taken from the poor under Inclosure Acts (see *e.g.* 8 & 9 Vict. c. 118, § 73). The Allotment Acts of 1887 & 1892 and sections 9 & 10 of the Local Government Act 1894, go further and enable local authorities to take land compulsorily for the purpose of allotments. Historically these laws grew out of pauper legislation (59 Geo. III. c. 12; 1 & 2 Will. IV. c. 42), logically they are the expression of new agrarian ideas to which there is no analogy since the Tudor and early Stuart policy of "laying land to houses" for the benefit of small tenants and labourers (see *e.g.* G. Roberts' *Social History*, 1856, p. 184).

(*d*) Compulsory terms are often read into certain contracts which pass property. Thus it is provided by 17th century judge-made law that a mortgagor cannot contract away his power of redeeming. The agricultural tenant *qua* agricultural tenant, can kill ground game under The Ground Game Act 1880, and has compensation for improvements under the Agricultural Holdings Acts 1883-1900. The tenant-right of Irish tenants includes under the land act of 1870 compensation for disturbance, and under that of 1881 fixity of tenure and free sale. Under the Merchant Shipping Acts 1854-94, the sailor's contract for wages involves a lien on the ship. The Employer's Liability Bill, which passed the House of Commons in 1893, gave workmen compensation for accidents on the false analogy of this principle, by compulsorily inserting an implied term in the contract between employer and employee. It has always been a moot point where the law of contract ends and the law of property begins. In all the above cases, except perhaps the last, the sphere of the latter was enlarged at the expense of that of the former. The judiciary or legislature held

in these cases that certain contracts shall be construed as necessarily involving the transference of certain rights of property. How far this means may be used to favour new schemes of social policy is one of the historical problems of our time (see LABOUR IN RELATION TO THE LAW; LABOUR STATUTES). J. D. R.

LAISSEZ-FAIRE (from American point of view). In treating the subject of *laissez-faire*, the earlier writers on economics in the United States follow the general lines laid down by their English contemporaries. For the most part they accept *laissez-faire* as an economic maxim, though they are by no means in agreement concerning the limits of its application as a fixed rule of practical statesmanship. The great point of controversy lay in its pertinency to the system of protection practised by the federal government, and upon this the principal American economists are divided. The "orthodox school" have displayed their deference to the classical English economists by going in many instances to an even greater extreme of claiming for all economic laws the force of unbending laws of nature. Thus Amasa WALKER (*Science of Wealth*, p. 110) maintains that so far as the state urges the claims of its own safety in justification of interference with industry, "the principles of economic science must be silent," but that this interference is rarely, if ever, necessary, and that it cannot be too often repeated that individuals only need to be "let alone." A. L. Perry (*Political Economy*, p. 96) speaks of the natural laws of production as "inexorable" in their operation, and as taking their revenge without pity whenever custom or legislation thwarts them. In his later *Introduction to Political Economy*, p. 153, he asserts that it would be nothing less than "presumptuous" for certain men to set up at will barriers to trade and then to undertake to defend these barriers as an economical blessing to the world. William G. Sumner, in the fifth of his *Lectures on the History of Protection in the United States*, repeats that we are living here "under immutable and inexorable laws of social organisation," which we can neither avoid nor evade, and which avenge themselves when we try to escape their operation. Simon Newcomb ranges himself with the "orthodox school," but is more moderate in his views. His *Principles of Political Economy* (p. 444 *et seq.*) distinguish between *laissez-faire* as a principle and as a policy. He enumerates certain non-economic limitations to its practical application; he further distinguishes between what he terms the "let-alone" principle and the "keep-out" principle, the former claiming that the government should not stop the citizen, the latter that it should not act itself. A review of the criticisms urged against the "let-alone" principle leads Newcomb to the conclusion that it cannot be regarded as a necessary and universal truth, but that the exceptions adduced are insufficient to prove the principle entirely invalid. In a later essay (*Science Economic Discussions*, p. 64) Newcomb tones down his contention for *laissez-faire*: "The school of non-interference claims that, as a general rule, these [economic] ends are best attained by giving the adult individual the widest liberty within the limits prescribed by considerations of health and morality."

The AMERICAN SCHOOL of early economists deny the universal applicability of *laissez-faire*, but they, too, are not at one with each other. Henry C. CAREY, the apostle of the protective system, regards *laissez-faire* as the goal in which that system is to end (cp. *Social Science*, iii. p. 442). His works would lead us to infer that the doctrine of *laissez-faire* is disastrous in its operation only when applied in a community in which industrial development is still to be accomplished (*ibid.* p. 516). Among his followers, Horace GREELEY (*Essays*, p. 129) simply refuses in so many words to accept the doctrine, which he proceeds to demolish with the adjectives "fallacious, pestilent, and utterly mistaken," while E. Peshine SMITH (*Manual of Political Economy*), and Robert E. Thompson (*Political Economy*), uphold the protective system as an exception to *laissez-faire*, as a condition of greater economic freedom yet to come. Francis BOWEN, likewise of the school of Carey, professes faith in the "let-alone" principle, whose limitations, he says (*American Political Economy*, p. 18), are nearly as obvious as the principle itself; and which is in no way infringed by the maintenance of a protective tariff (*ibid.* p. 21).

President Francis A. Walker holds aloof from both these "schools," though inclining slightly to the one first discussed. With reference to *laissez-faire* he agrees substantially with Cairnes and Jevons, whom he quotes with approval in his *Political Economy*, but adheres to the policy so far as to insist (p. 416) that freedom is the rule and restraint the exception. While the necessity of making exceptions to the rule of freedom of individual action has been completely established, those who make these are bound to show cause for every such act of interference; their case is to be made good against a powerful presumption in favour of liberty—the condition which has the promise not only of that which now is, but also of that which is to come (*ibid.* p. 464).

The real revolt against *laissez-faire* appears with the rise of the "new school" of American economists comprising the younger writers more or less influenced by German thought. This group, under the leadership of Richard T. Ely, was active in forming the American Economic Association in 1885 to protest against the all-sufficiency of *laissez-faire*. Ely had but shortly before asserted (*Past and Present*, p. 23) that

laissez-faire "never held at any time in any country, and no maxim ever made a more complete fiasco when the attempt was seriously made to apply it in the state." The first paragraph of the declaration of principles which he proposed for the newly-formed association concluded with these words: "We hold that the doctrine of *laissez-faire* is unsafe in politics and unsound in morals, and that it suggests an inadequate explanation of the relation between the state and the citizens." The discussion upon this subject disclosed the fact that while there were grave objections on the part of many present to taking a decided stand on the question of state interference, the trend of opinion was substantially in harmony with the declaration formulated by Dr. Ely. As finally accepted, however, the first paragraph reads: "We regard the state as an agency whose positive assistance is one of the indispensable conditions of human progress," while an appended note announces that it was proposed and adopted as a general indication of the views and purposes of those who founded the association, but was not to be regarded as binding on individual members. The general views of the "new school" also find expression in an exhaustive arraignment of the *laissez-faire* doctrine by Henry C. Adams, a leading member, entitled *The Relation of the State to Industrial Action*, and republished by the American Economic Association. Adams follows closely the analytical methods of Cairnes. He restates the doctrine in the form of a syllogism, and denies its logical basis; but he refuses to stop with Cairnes at destroying its claims as a working rule of economics, and supplies its place with a newly-formulated principle of state interference. He contends that it becomes the duty of the state to interfere in industrial relations, (1) to determine the plane of competitive action; (2) to realise for society the benefits of monopoly; and (3) to restore social harmony by extending the functions of the state. From this position, namely, of fixing a field where the rule of interference is to be recognised, toward which many of the younger economists seemed to incline a few years ago, a reaction has set in in very recent times—a reaction in which the attitude of President Walker is finding favour with the greater number of economic students in the United States. J. Lawrence Laughlin (*Journal of Political Economy*, I. No. 1) maintains that "the once-called 'new school'" is losing its authority in the American Economic Association, but this has been strenuously denied. The general drift of economic opinion, as indicated in the current writings of members of the association, however, appears to be against the exercise of state interference in every case where the preponderance of evidence is not clearly in favour of its expediency and beneficence.

The applications of the maxim of *laissez-faire* may be conveniently discussed with reference to the violations of the rule of non-interference by the federal, state, and municipal governments. (1) The legislation of the federal government has never conformed to the doctrine of *laissez-faire*. The very first revenue law enacted in 1789 professes in its preamble to afford protection to American industries, and this purpose has never been absent from the tariff, whether proposed by one political party or the other; while the author of the latest Wilson tariff law acknowledges that it is a protective measure. An outright bounty on sugar has been the culmination of the protective policy. The United States held stock in each of the two United States banks. It furnished funds for the first experiments with the electric telegraph, and encouraged the building of railroads by the grant of land subsidies and even by the loan of money. It suppresses note issues by state and private banks, and interferes to prevent the sale of food products under false names (as oleomargarine). (2) The state governments have been no less active in participating in industrial undertakings. They have built railroads, subscribed to the stock of railway corporations, and given them aid by donations of land and money. They have later stepped in to limit the abuses of private railroad management, in some instances ending in the statutory prescription of maximum rates of charges for the transportation of passengers and freight. They at one time quite generally entered into the banking business. Factory legislation of all kinds has found its way on to the statute-books of different states, while a few states have established limits upon the hours of daily labour. (3) American municipalities, when duly authorised thereto, have not hesitated to overstep the bounds prescribed by *laissez-faire*. Their activity lies largely in the field of so-called "monopolies of service." In 1890, nine cities owned and operated gas-works; out of 2037 water-works plants, 877 were under public management; about 150 cities and towns operated electric lighting plants; one street railway was conducted by a municipal administrative board. At the same time many other cities shared in the profits of these quasi-public enterprises. The activity of American municipalities in this field appears to be on the increase.

LA JONCHÈRE, DE. See DE LA JONCHÈRE.

LAKH or LAC is a Hindustani word meaning 10,000, commonly used in Indian finance in computing rupees. C. A. H.

LALOR, JOHN (1814-1856), was a writer on social questions. He graduated at Trinity College, Dublin, in 1837. As an assistant poor-law commissioner he collected much valuable information, but in 1836 he left Ireland for London, where he became one of the editors of the *Morning Chronicle*. About 1844 he also became editor of a Unitarian weekly paper, *The Enquirer*, to which he contributed papers on social questions, such as the Factory Bill, Ireland, and Education.

Lalor's last work was *Money and Morals: a Book for the Times* (London, 1852). The problem here discussed is what will become of the ten millions of new gold which, "within a comparatively short period," says Lalor (p. 103), have come into England. The author thinks that instead of coming into the currency the influx will quicken trade, especially in Lancashire (p. 110), encourage rash speculation, and effect a rise not only in manufacturing, but also in agricultural incomes. In short, it will exist as capital (p. 124). In the second part of the work Lalor advocates "the adoption of a financial policy, which, though perfectly consistent with free trade in the food of the people, is not consistent with the exaggerated maxim of leaving the whole direction of industry to private interest" (p. 125). As a precaution against the *laissez-faire* principle, he suggests the expenditure of excess capital in agricultural or colonising loans, in the improvement of town dwellings, sanitation, and the water-supply. The position of England among the nations, and the national defences, are next discussed, while in part iii. the author passes on to consider the remedy for the social evils with which England is threatened. After discussing the respective prescriptions of Auguste COMTE and T. CARLYLE, Lalor insists that practical Christianity can be the only effectual cure for the diseased body politic. A portion of the book was in 1864 reprinted as *England among the Nations*. A. L.

LA LUZERNE, CÉSAR-GUILLAUME DE (1738-1821), termed by Lecky "an eminently wise and high-minded statesman," entered the church and became Bishop of Langres at the age of thirty-two. In 1789 he endeavoured to stem the democratic torrent by proposing the establishment of a second chamber, and, when this proposal was rejected, the addition of 600 members to the representatives of the nobles and clergy. Unable to influence events, he retired to his diocese, and afterwards emigrated to Switzerland, whence, however, he returned on the accession to power of Napoleon. After the restoration he was made a peer of France, and in 1817 a cardinal.

Among numerous other works he wrote *Dissertations sur le prêt du commerce*, Dijon, 1823, 8vo, 3 vols.; a voluminous treatise on the lawfulness, from the stand-point of the Roman Catholic Church, of taking interest for money (see INTEREST AND USURY).

[*Dictionnaire des Parlementaires Français*, Paris, 1891, vol. iv.—*Nouvelle Biographie Générale*, Paris, 1860, vol. xxix.—*Introduction to the Study of Political Economy*, by L. Cossa, Eng. trans., London, 1893, 8vo, p. 162.] H. E. E.

LA MARE, DE. See DE LA MARE.

LAMBE, SAMUEL (fl. 1657), merchant, published *Seasonable Observations humbly offered to his Highness the Lord Protector*, London, 1657, fol., in which he suggested the establishment of a bank at London. His scheme was, that governors should be chosen from the trading companies, that the bank should "let out imaginary money on credit at 2½ or 3 per cent at most," and receive deposits withdrawable on demand, that all "bills of exchange" should be received and paid into the bank, and that the profits should go "to the good men who manage the bank." The bank was also to supply another subordinate one "with stock to let out any sum under £5 or £10 at reasonable rates upon pawns or other security." Lambe's proposals were referred to a committee of the East India Company for their consideration on 30th Dec. 1657. His work also contains useful information on the Navigation Act, the competition between England and Holland, and other subjects. W. A. S. H.

LAMBIN DE SAINT FÉLIX. See LOTTIN, A. P.

LAMMAS-LANDS, LAMMAS-MEADOWS, were open-field arable and pasture lands, held in severalty and enclosed during the growing of the corn and hay crops respectively, but open during the rest of the year to all who had rights of common upon them. They were thus commonable, not common, lands. Under the old open-field system of agriculture such common rights might be upon the whole a convenience to the inhabitants, but the introduction of roots made rights of winter pasture intolerably wasteful; as late, however, as 1844, lands subject to these rights were still abundant in England, though there were few or none in Wales.

Lawyers generally distinguish "lammas" from "shack" lands by the fact that the former were commonable to other inhabitants besides those having severalty rights on the land. But Nasse (*Feldgemeinschaft*, p. 3) denies this distinction, which he thinks a mere local detail. The classes of commoners varied locally: they were "sometimes the inhabitants of the parish; sometimes a class of inhabitants,

as the freemen of the neighbouring town, or even the householders; and perhaps more generally the owners or occupiers of ancient tenements within the parish, usually termed tofts" (G. W. Cooke, *Acts for facilitating the Inclosure of Commons in England and Wales*, 1850). The usual time for the resumption of common rights was Lammas-day, 12th August[1] (the old 1st August) for arable lands, and 6th July (the old Midsummer) for meadows. Commonable meadows were probably called lammas-meadows by analogy, as it is rare to find them opened as late as Lammas-day. In some cases the common rights lasted till November, in some till the middle of February. The fixed dates for opening, especially Lammas-day, gave rise to difficulties which were met in various ways. About Nottingham, when the customary day arrived, according to a witness before the select committee in 1844, "the population issue out, destroy the fences, tear down the gates, and commit a great many other lawless acts, which they certainly have a right to do." These Nottingham lands were used for recreation, not for pasture. In other places things were managed better. On the lands of St. John, Hackney, on 26th July 1692, the "proprietors of the commonable lands" were "allowed ten days to carry off their crops on account of the wett"; and there is a similar entry in 1763 (Garnier, *English Landed Interest*, 1892, p. 202). Scriven (*Law of Copyholds*, 6th edition, p. 310) cites a case where the beginning and end of the season were regulated by bye-laws made by the tenants of the manor; and an act of 13 Geo. III. c. 81, § 7, enacted that three-fourths in number and value of the occupiers of open- and common-field lands might agree in a meeting to postpone the opening for a reasonable time. Later enclosures have left few traces of these commonable lands.

Jour.*, 1891.]

E. G. P.

LAMOND, ELIZABETH (1860-1891), was the eldest daughter of William Lamond, advocate at the Scotch bar. She had hoped to devote herself to teaching, and she was engaged in this work at St. Andrews before entering Girton College, Cambridge, where she obtained honours in history (1885-1887). After a few months of teaching at Winchester her health gave way and she was forced to occupy herself with literary work. In 1890 she edited for the Royal Historical Society four unpublished treatises in Norman French, *Walter of Henley*, *Seneschaucie*, the anonymous *Husbandry*, and Grosseteste's *Rules*. The translation and glossary gave proof of her scholarly feeling and accurate knowledge. In the course of researches connected with this work, she discovered that the well-known dialogue, published by W. S. in 1581, had been composed some years earlier, and in a convincing article in the *English Historical Review* in April 1891, gave good grounds for believing that it had been really written in 1549, that John HALES was the author, and that Coventry was the place of writing. She was not able to complete the edition of the *Discourse on the Common Weal of this Realm of England*, on which she was engaged at the time of her death; but a posthumous publication contains the result of her researches. *Walter of Henley*, Longmans. —*Discourse of Common Weal*, Camb. Univ. Press. See also a review of the latter work in *Economic Journal*, December 1893. W. C.

LAMPREDI, GIOVANNI MARIA (18th century), professor of public law in the university of Pisa, and author of *Del Commercio dei popoli neutrali in tempo di guerra*, Milan, 1831, 12mo.

This work, which according to M'Culloch (*Lit. of Pol. Econ.*, p. 127) is well reasoned and of considerable authority, was twice translated into French, first by Jos. Accarias de Serionne (La Haye, 1793, 2 vols. 8vo), and again by Peuchet (Paris, 1802). The latter, in his preface, remarks that Lampredi has on the whole treated his subject impartially, but with a strong bias in favour of neutral goods passing free.

Other publications of Lampredi are:—*Del governo civile degli antichi Toscani e delle cause della lor decadenza, discorso*, Lucca, 1760, 4to.—J. M. L. . . . *de licentia in hostem liber singularis, in quo S. Cocceii sententia de infinita licentia in hostem . . . confutatur*, Florence, 1761, 8vo.—*Saggio sopra la filosofia degli antichi Etruschi, dissertazione istorico-critica*, Firenze, 1756, 4to. A. L.

LAND. Primitive custom recognises certain rights in and over land: the "right of the first clearer" to regard the land which he cultivates as his own family holding (Baden Powell, *Systems of Land Tenure in British India*, i. 221); the right of a chief or freeman to a share in the territory which he helps to defend against outsiders; the right of a chief to levy tribute from those who hold land under his protection. There is at this stage no ownership in the modern sense of the term; the powers of the individual are controlled by family rights and local custom. Common

[1] The new style was introduced throughout the British dominions in 1752, by omitting eleven nominal days after 2nd Sept., and dating the next day 14th Sept. instead of the third.

ownership, it should be noted, is not a mark of social equality, but rather of inequality; it grows out of the combination of members of a ruling family to maintain their landlord-right, or of members of a subject community who can only live and pay their tribute by adopting co-operative methods of husbandry. When the state comes into existence the family loses some of its importance; the individual chief or house-father is not merely the administrator of a common inheritance; he is *dominus* or owner of his land; it is a thing *in patrimonio*, to be disposed of by will or settlement, a thing *in commercio*, which he can sell or mortgage. *Dominium*, absolute ownership, is the basis of the Roman law of ownership and possession. The system had great economic advantages, but the small cultivating owner could not hold his own under the stress of competition; the tendency was towards the formation of the LATIFUNDIUM, large estates cultivated by slaves. The Teutonic chiefs who founded their kingdoms on the ruins of the empire admired the precision of Roman law; but they retained the primitive belief in the tribal or national organisation of society. The king as leader of the nation was lord paramount over all lands, and claimed service and allegiance from their owners; he was not in direct relation with the peasantry, except on his own estates, but he protected them, so far as he had power, against the oppression of their immediate lords. England is a typical example of feudal monarchy; the state, represented by parliament and the king's judges, broke down the rights of the great lords, and gave freedom of disposition to all owners of land. In 1285 the lords obtained an act to maintain the strict rule of entail; but the courts did not favour "perpetuities," *i.e.* arrangements for tying up property for indefinitely long periods; the statute was evaded, and the owner in fee tail was enabled to exercise all the rights of an owner in fee simple. Military tenures were finally abolished in 1661. The services of SOCAGE tenants (ordinary freeholders) were commuted for fixed sums of money; with the change in the value of money these annual payments became of no importance and were bought up or forgotten. Copyhold tenure, where it survives, still operates to curtail the freedom of disposition enjoyed by the owner of land; but the Copyhold Acts, passed between 1841 and 1887, provide a variety of forms whereby copyhold lands may be enfranchised or turned into freehold (see the Copyhold Act 1894). The Real Property Commission of 1830 marks a turning-point in the history of our land laws; the suggestions of the commissioners were embodied in a long series of reforming statutes. Forms of settlement and conveyance have been simplified, and extensive powers of disposition have been given to limited owners, *i.e.* to persons having a life estate or other limited interest in land. Under the Settled Land Act of 1882 a tenant for life may sell a family estate; the purchase money is treated as capital to be invested, and remains subject to the trusts of the settlement. In many points the law of real property has been assimilated to the rules which govern the devolution and disposition of personal property. Legislation has not destroyed the sentiment which leads an owner of land to add to his estates and to transmit the inheritance undivided to his eldest son; the practice of resettling family estates in each generation still prevails among the great landlords. There has been of late years a marked reaction against the liberal doctrine of absolute ownership and free contract. The Agricultural Holdings Act of 1883 is based on the assumption that a tenant-farmer is not in a position to contract freely with his landlord, and must therefore be protected by the state. The Irish Land Acts of 1870 and 1881 had gone farther in the same direction; they introduced a kind of dual ownership in land, and attempts have since been made to restore the rule of individual ownership by assisting the tenant to purchase his landlord's interest. In Scotland, the crofters of the highlands and islands have obtained legislation of a similar character. In England, there has not been as yet any urgent demand for judicial rents or schemes of land purchase; farmers are fairly content with the Agricultural Holdings Act, and labourers with the acts which facilitate the acquisition of allotments and small holdings. Socialist ideas in regard to land have begun to influence the popular mind. Sir Henry Maine pointed to the rapid settlement of North America as an example of what can be done under a system of individual ownership; Mr. Henry George uses the United States as an example of the evils caused by permitting large tracts of land to be held and disposed of by private owners. Mr. George would "nationalise" the land by taxing it up to its annual value; and in England various plans have been proposed for intercepting what is called the "unearned increment" in the value of land (see BETTERMENT). If the legislature succeeds in creating a large body of small owners, there will probably be a reaction in favour of absolute ownership; for this reason the more logical among Mr. George's disciples oppose the measures which have for their object the multiplication of peasant proprietors.

Laws requiring the registration of all titles to land are advocated on the ground that they help to simplify transfers. They have worked well in new countries, but great difficulties are encountered in applying such laws to an old country where titles are already complicated. In England the acts permitting or requiring registration have not been successful.

T. R.

In connection with Land the following articles occur in the Dictionary: — Agricultural Community; Agricultural Holdings Acts; Agricultural Systems; Agriculture in England; Allotments; Arable Land, Conversion of, into Pasture; Commons; Corvée; Cottiers; Culture, Large and Small; Depopulation; Depression, Agricultural; Domesday Book; Emigration; Enclosures; Enfranchisement of Land; Entail; Farming; Feudalism; Forests, Mediæval; Forests, Economic Aspects of; Gangs, Agricultural; Holdings, Large and Small; Impôt Unique; Land; Land Companies; Land, Domaine Congéable; Landgafol; Land, Law Relating to; Land Legislation, Irish; Land, Nationalisation of; Lands, Public, of the United States; Land Registration; Land System in the American Colonies; Land Tax; Land Tenures; Land Banks, Schemes of, in England; Landes-Creditkassen; Majorat; Manor; Métayage; Métayer, in West Indies; Minorat; Open Fields; Peasant Proprietors; Primogeniture; Rent; Rent Charge; Rent of Land; Serf; Services, Predial and Military; Settled Land.

LAND COMPANIES may, as a result of practical experience, be divided into two classes: one consisting of those which are concerned with the exploitation of large blocks of land, chiefly abroad; the other of those which deal rather with the financing of owners and occupiers of land and the realisation of their produce.

(1) Companies which take up blocks of land may be again subdivided into two classes, consisting respectively of—

(*a*) Those whose primary object is colonisation. A notable example of these, both from its own history and its close connection with Edward Gibbon WAKEFIELD, was the old New Zealand Company of 1825, which became in 1838 the New Zealand Colonisation Company, and in 1839 the New Zealand Land Company. To a large extent this company, by taking up lands and allotting them to settlers, was the parent of colonisation in New Zealand. It was a type of a regular system of which there were other examples about the same period of English history. In later times (1884), the Methuen settlement in South Africa, which turned out a failure, was a company of this kind, and the more recent Bechuanaland Concessions Company, now merged in the London and Pretoria Financial Agency, had a similar object in taking up and re-selling large areas of farm land.

(*b*) Those companies whose primary object is the use of the land for mining, timber-cutting, etc., and more rarely for actual cultivation. This is the more popular class at the present time; and of late years many large concessions of land all over the world have been given for these purposes both by civilised and savage states. The Bechuanaland Land and Exploration Company, the Mexican Concessions Company, the Pahang Concessions Company, are instances which have been recently before the public. Such companies are too often of a speculative character, and too apt to rely upon making profits by parting with portions of their territory to other companies.

The British South Africa Company is a notable instance of a company combining both functions [cp. COLONIES, GOVERNMENT OF, BY COMPANIES].

(2) "Land mortgage and financial agencies" is the general term adopted in the share lists for companies of our second class, but their titles vary; for instance we have the Anglo-African Land, Mortgage, and Investment Company, the Auckland Agricultural Company, the British Land and Mortgage Company of America, and others all devoted to the same class of business. There are at least fifty companies with a paid-up capital of over £20,000,000 enumerated in the stock exchange lists primarily connected with the land. One "deals with real estate," another is designed "to lend on first mortgages in the States and Canada," another is to work certain estates with a view to resale; others deal in products as well as land. But all have the general scope above indicated (see also MORTGAGE BANKS).

C. A. H.

LAND, DOMAINE CONGÉABLE (literally ejectable domain, also called *tenure covenancière* or holding by covenant). This form of tenancy, peculiar to Celtic Brittany, which has not yet disappeared, seems to have been introduced during the last centuries of the middle ages; a law of the 6th of August 1791 suppressed the feudal incidents which had gradually been annexed to it, but allowed the principle on which it is based to continue. The position of landlord and tenant is as follows: with respect to third parties, the tenant enjoys all the rights of a freeholder; with respect to his landlord, he is only bound to pay a fixed rent, which in former times was generally very low. In modern times the practice of nine years' leases has prevailed, the leases being renewable on the payment of a fixed sum of money called *commission* or *nouveauté*. The landlord has only the ownership of the ground (*fonds*), the tenant owns the buildings and enclosures which he has erected, the trees he has planted, even the one-year-old furze which grows on waste land: hence the distinction between the *foncier* and the *superficiaire* or *domanier*. The former may always serve on the latter a notice to leave (*congément*), but in that case he is obliged to pay him a full compensation according to a detailed valuation for the buildings, plantations, crops, enclosures, improvements, etc. Owing

to the heavy expenses entailed by a *congément*, this system led to the stability of the tenantry and the most efficient cultivation consistent with the nature of the land and the agricultural knowledge of the period; it is, in fact, a thorough application of tenant right.

The passion of the French peasantry for the investment of their savings in land has exerted an unfavourable influence on the maintenance of this kind of tenancies; still, at the end of the second empire it was computed that about one-third of the territory of Brittany was held under these terms.

LANDGAFOL, a customary rent paid to the lord of the manor by his tenants, distinct from other customary payments due to him on special occasions. The distinction grew clearer with the process of commuting services and payments in kind for money (see GAFOL).

LAND, LAW RELATING TO. The law of property is chiefly concerned (1) to define the nature of the rights which are recognised in objects of property, and (2) to define the modes in which such rights may be acquired, transferred, or extinguished. With respect both to the rights of which it is the object and to the acquisition, transfer, or extinction of such rights, land differs from every other object of property. Land is immovable, imperishable, and wide in extent. It is a prime necessary of life, and furnishes the raw material of all wealth. It admits of being used in innumerable ways. It has been a basis of political power and social consideration. It is susceptible of what Bentham terms "a value of affection," as distinct from market value in a higher degree than any other object of common use. At the same time it is limited in quantity, and although it can be rendered more productive by the expenditure of capital and labour, the returns from this expenditure fall off after a certain point has been reached, and at a remoter point become inappreciable. As compared with other forms of wealth, land is, in the long run and in most countries, the most generally and the most ardently coveted. Under these circumstances it is natural that the law relating to land should be complex, and should differ much in different times and places.

The right of property in land admits of subdivision in various ways. The state is everywhere supposed to have certain rights over the land which are indispensable for the safety and welfare of the public. These rights are sometimes termed its EMINENT DOMAIN. A familiar instance is afforded by the claim of the state when it thinks expedient to purchase or to enable others to purchase land which the owner is not disposed to sell. The Roman lawyers held that though there might be full ownership in the soil of Italy, there could be only a possessory right in the soil of the provinces which was, strictly speaking, vested in the Roman people or in their representative the emperor. The chief practical indication of this difference was the land-tax, which was paid by the provinces, but not by Italy. In eastern countries the proprietary right of the sovereign is so large and vaguely defined that it is difficult to say how far the subject can ever be deemed a proprietor. But the subdivision of proprietary rights over land with which we are most familiar has resulted from the feudal conceptions of tenure and of particular estates in land (see FEUDALISM; MANOR).

According to the rigorous feudal theory, the sovereign alone has property in the land, and no subject can be more than a tenant. But every tenant may give himself sub-tenants, and they may repeat the process indefinitely. Thus the land would come to support an ascending hierarchy of tenants closing in the king as lord paramount. Each would have rights that could not be lawfully infringed, and duties that could not be lawfully discarded. Each would be protected by law, and still more by custom, against the rest. The king, who had the loftiest theoretic claim, would probably derive the least practical advantage from the land. It would be difficult, were the doctrine of tenure carried to its logical conclusion, to say who, if any, of the persons interested in the land could be termed its proprietor. But the process of subdividing interests in the land is carried still further by the help of the doctrine of estates in land. For each person in the ascending scale which we have described might have his interest in the land either for life, or to himself and the heirs of his body, or to himself and his heirs generally. He might have an estate for life, or an estate tail, or an estate in fee simple. If his estate were only for life he would be unable to devise it by will, or to give anybody rights in the land lasting beyond his own decease. Nay, more, his power of using and enjoying the land would be restricted in the interest of those who were to come after him. If his estate were an estate in tail or in fee simple his powers of alienation and enjoyment would be more extensive. Under feudal law, in brief, not only may proprietary rights be divided between lord and vassal, but they may also be divided between tenant in possession

and tenant in remainder (ENTAIL, LAW OF). A man who has the largest estate possible in land, in English law a tenant in fee simple, can thus carve out of his own interest a number of lesser estates to take effect after his death, so as to control its devolution for many years. The natural wish of landowners to exert this power to the utmost has given rise to *family settlements*, and the endeavour of the judges to restrict the practice of settlement in the public interest has given rise to the rules against *perpetuities*. The decay of the manorial system produced a distinct form of imperfect ownership of land, known in England as copyhold tenure, which was once widely extended in western Europe, but was abolished on the Continent by the French Revolution, and is gradually disappearing in England by the operation of the acts for the enfranchisement of copyholds.

The tenures of which we have hitherto spoken are distinctly feudal in origin, and have either been abolished, as in France, or have been rendered almost unmeaning as in England. In England, successive statutes, framed without any regard to symmetry, have removed almost all the inconveniences attaching to the feudal law of real property, and have left hardly anything of feudalism save names and forms. The relation of landlord and tenant has nothing feudal about it. Indeed, the strictly feudal law regarded a lease as unworthy of its attention, as may be seen by the fact that leaseholds are regarded not as *real* but as *personal* property. The practice of letting land for a money rent has been recognised by all civilised legal systems. It does not involve a division of ownership, but it may assume forms which are tantamount to such division. Thus, by the Roman contract of EMPHYTEUSIS the tenant acquired the land in perpetuity, subject to the obligation of paying rent. The Irish tenant, whose rent can be altered only at intervals of fifteen years, and then only by the decision of a court, has an interest in the land which often exceeds in market value the interest of the landlord. Such a tenant can hardly help regarding himself as at least part proprietor. Political, economical, and social forces are constantly operating on the legal relations of the classes living on the land, and may turn a nominal tenant into a virtual owner, as they have turned nominal owners into virtual serfs. Even when it is easy to ascertain the proprietor of a piece of land, his right of property may be limited by rights over that land vested in other persons. Such rights are described in Roman legal language as *jura in re aliena*. They are of two kinds. Some are valuable in themselves, whilst others are valuable only as security for a debt due from the owner of the land. Rights of the first class, known in Roman law as *servitudes*, and in English law as *easements*, and *profits-à-prendre*, are exemplified in the right of way across another's land, in the right not to have ancient lights darkened by the erection of new buildings, and in rights of common which include the right of grazing cattle, the right of digging gravel, the right of cutting turf and firewood, and so forth. Rights of this class may be enjoyed by a man as proprietor of certain land, and are then said in English law to be *appendant* or *appurtenant*, or they may be enjoyed by him irrespective of any such property, and are then said to be *in gross*. A similar distinction was expressed in Roman law by calling some servitudes *prædial* (Lat. *prædium*, an estate) and others *personal*. It is worthy of note that the Roman lawyers regarded a right of usufruct in land, the nearest equivalent of the English estate for life, not as a form of property, but as a personal servitude. The second class of rights enjoyed with reference to the land of another includes such as form a security for debt. As land, whilst highly valuable, can neither be removed nor concealed, it has always been the favourite security for money lent, and the law of *mortgage* forms an important chapter in the law of land. In the primitive mortgage the debtor conveys the land to the creditor subject to a condition that it shall be reconveyed to himself when he repays what he has borrowed. Should he fail to pay punctually he will lose his land, although its value may far exceed the amount of the debt. The injustice of such a transaction led to the invention of improved forms of mortgage The *hypotheca* of later Roman law was a contrivance by which the mortgaged land was left in the ownership and possession of the debtor whilst the creditor obtained the right of realising his debt out of it in case of default in payment. The modern English mortgage, the result of the correction of the common law by courts of equity, resembles the *hypotheca* in its practical working, although it retains the form of a conveyance.

The modes of acquiring, transferring, and extinguishing rights of property are in the main similar for land and for other objects of value. Land which has no owner—there is none such in England—may be acquired by the first occupant or by the owner of other land to which it accedes, as where a field is enlarged by alluvial deposit. The course of years (see LAPSE OF TIME; PRESCRIPTION) may extinguish an old and create a new proprietary right. Sale, gift, exchange, and succession, testamentary or intestate, transfer rights of property in land as in other things. But a peculiar form is often required for transactions affecting interests on land. Land cannot be passed from hand to hand like a movable. It is peculiarly necessary, therefore, to provide evidence of transfer. In primitive times, when writing was either unknown or little used, this object

was attained by requiring for every transfer of land certain solemn forms which might impress the memory, not merely of the parties, but also of the community or at least of the neighbours. Such was the primitive Roman *mancipation*, a formal sale in the presence of five witnesses and of a man who held the balance used to weigh the uncoined money of the early Italian society. Such, too, was the old English ceremony of *livery of seisin*, the symbolical delivery of land by the seller to the purchaser. But where the art of writing has been generally diffused, written documents are found more convenient to execute and more effectual in preserving an exact record of what has been done. In England at the present day a deed is the recognised form for conveyances, leases, mortgages, and so forth. But where manifold interests have been created in reference to one piece of land, such documents are apt to be lengthy, and where dealings in land are frequent they accumulate to an inconvenient extent. Hence the advantage of a further reform, the registration of title (see LAND REGISTRATION). An efficient system of registration ensures a complete, concise, and authentic record of all transactions affecting land, and thus promotes the abbreviation of legal documents and the reduction of legal charges. England is one of the few civilised countries which does not possess an effective registry of title to land.

Passing from the outline of the law relating to land to the suggestions which have been made for its improvement, we have to remember that every plan of reform is to be judged in relation at once to the existing circumstances and to the object which it is designed to accomplish. The object of an agrarian reformer may be either to improve the condition of tenants on the land of another, or to multiply proprietors, or to put an end to private property in land and vest it either in the sovereign or in municipal authorities. The first of these objects is sought by measures securing to the tenant compensation for the improvements which he has made (see AGRICULTURAL HOLDINGS ACTS), or fixity of tenure at a fair rent and freedom to sell the interest on the land which such fixity creates (see F's, THE THREE; and LAND LEGISLATION, IRISH). The second object, that of multiplying proprietors, may be obtained by various expedients, such as (1) the establishment of a system of free alienation and registration of title so as to encourage sales and to make the sale of small parcels of land expeditious and cheap, or (2) making advances of public money to tenants, especially to such tenants as already enjoy fixity of tenure, in order that they may buy out their landlords and become full proprietors, or (3) enabling lessees of house property to compel the lessors to sell the reversion, and thus enlarging leaseholds into freeholds, what is commonly known as leasehold enfranchisement, or (4) enforcing the partition of landed estate among the children of a deceased owner, on the principle adopted by the *Code Napoléon*. It may be said that there is a real affinity between reforms of the first and of the second class. Measures tending to secure to tenants the advantages known as the Three F's find their natural complement in measures tending to turn tenants into full proprietors. For what is virtually a divided ownership can hardly be permanent in a society not governed by immemorial custom. The charms of property are most strongly felt by him who is absolute proprietor. Reforms of the third class, reforms which aim at the abolition of private property in land, are advocated on totally different grounds, and imply a totally different economic theory. To this class belong proposals for the "nationalisation" of land, *i.e.* the transfer to the state of all private rights of landed property, and proposals for the "municipalisation" of land in towns, *i.e.* the transfer to the municipal authority of all private rights to land within its jurisdiction. Those who advocate changes of this nature differ on the question of giving or refusing compensation to evicted owners. But they agree on the more fundamental point of allowing no private person to be more than a tenant. Far more restricted in scope, and resting in some measure on narrower arguments, is the proposal to give municipal authorities the advantage of what is known as betterment (see BETTERMENT), in other words, to give them the power of charging the expense of municipal improvements upon the owners of land which is increased in value by such improvements.

F. C. M.

LAND LEGISLATION, IRISH. The history of modern legislation with regard to land in Ireland is full of economic interest. The agrarian troubles of Ireland have arisen from many causes, the most important of which are, perhaps, the following: (1) The forcible dispossession of the original proprietors by foreign conquerors. The first English conquest of Ireland, effected under the Plantagenets, did not lead to chronic agrarian strife, because the Anglo-Norman barons adapted themselves to Irish ways and became Irish chiefs. But the three subsequent English conquests by Elizabeth, by Cromwell, and by William III., led to the confiscation of much the greater part of the

land of Ireland, and established a new class of landowners closely connected with England and severed by religion from the peasantry. In parts of the north of Ireland not only the native chiefs but the native cultivators had been ousted to make room for English or Scotch settlers, and here the new landlords and tenants lived on tolerably good terms. But elsewhere the owners and the cultivators were too generally enemies, or at least aliens, to one another.

(2) The defects of the new agrarian system introduced by conquest. The English conquerors naturally introduced into Ireland the agrarian system to which they were accustomed at home. But they omitted one thing essential to its proper working. Since agriculture became a progressive art in England all great agricultural improvements have been made by the landlord. They would not have been made by the tenant who has no legal fixity of tenure. In Ireland the making of agricultural improvements was commonly left to the tenant. He was generally too poor to execute them properly, and he had no security for compensation when he had made them. For he had no legal fixity of tenure, and with the growth of population was exposed to a severe competition for holdings. In Ulster and in some districts elsewhere custom protected the tenant against arbitrary eviction or the appropriation of his improvements by the landlord. Under this custom, known as the ULSTER TENANT-RIGHT, the tenant could sell his interest in the holding to his successor. Where this custom prevailed, agriculture as a rule flourished. Elsewhere it was very backward.

(3) The normal balance of occupations was never attained in Ireland. Agriculture, especially in the south and west, was almost the only resource of the population. Ireland is not well adapted for manufacturing industry, and such industries as the English and Scotch settlers had brought with them were too often crushed or hampered by the misdirected legislation of the English parliament in the 18th century. Commerce and manufactures, which would have drawn off the surplus population, and furnished new capital for the improvement of the land, were thus reduced to the narrowest limits.

(4) The evils arising from these causes were intensified by the introduction of the potato, which in the 18th century became the staple food of the Irish peasant. This cheap and abundant food enabled a poor and prolific people to multiply at a rate hitherto unknown in old countries. In 1741 Ireland may perhaps have contained two million inhabitants. In 1841 it contained upwards of eight millions. The majority of these eight millions were sunk in extreme poverty. The land was subdivided to an extent incompatible with its proper cultivation or the well-being of the cultivator. Competition raised the rent of land in many cases beyond the amount that could be extracted from the soil. It necessarily followed that hundreds of thousands of tenants were hopelessly in arrear with their rent and exposed at every moment to eviction. Under these circumstances the proprietors themselves could not be prosperous. They had too generally adopted the careless, sociable, and extravagant habits of the native gentry whom they had displaced. They were in many instances hopelessly sunk in debt or burdened with family encumbrances, and quite unable to face the expenditure necessary to put their affairs into decent order. Such was the agrarian condition of Ireland when the potato blight of 1846 and 1847 brought about, first, a terrible famine; secondly, a great mortality from epidemics; and lastly, an immense emigration to the New World. In a short time Ireland lost one-third of her population. About the same time the repeal of the corn laws deprived the Irish farmer of his advantage in the best market of Europe. The potato blight and the repeal of the corn laws led to a wide extension of pasturage and to evictions of tenants. These in turn added fuel to the agrarian discontent which has always been smouldering in Ireland. Then it was generally felt that something must be done. But the public opinion of England and the sentiment of the Irish peasants were not in accord. The ruling passion of the Irish as of the French peasant is to become proprietor of his holding. This passion, however, could not be gratified without the breaking up of great estates, which involved sacrifices on the part of Irish landowners, and was distasteful to the English landed interest. Failing full property in his holding, the Irish tenant desired fixity of tenure, which most landowners were unwilling to concede. The economic ideas then predominant in England were opposed to any interference with the free play of competition, and the determination of rent by the higgling of the market. Thus the progress of Irish agrarian reform was slow. It falls into three stages.

I. An attempt to get rid of embarrassed landowners, and to replace them with new men of energy and capital.

II. A gradual concession to the Irish demand for what are known as the Three F's—(see F's, THE THREE), fair rent, fixity of tenure, and freedom of sale.

III. An attempt still in progress to turn the tenant into a proprietor by advances of public money for the purpose of enabling him to buy his farm.

I. The Encumbered Estates Acts.—

The first of these is the act 11 & 12 Vict. c. 48, 1848, to facilitate the sale of encumbered estates in Ireland. It was followed by the act 12 & 13 Vict. c. 77, 1849. This provided that

the owner of an encumbered estate or an encumbrancer might apply to the commission established by the act for an order to have the land sold notwithstanding any restrictions of settlement. The commission was empowered to authorise a sale, if the charges on the estate amounted to one-half of the income thereof, and to pay off encumbrances out of the proceeds, handing over the balance to the owner or to other persons interested in the land. This act has been amended by subsequent statutes. The jurisdiction of the commission was transferred by the act 21 & 22 Vict. c. 72, 1858, to the landed estates court, which still exists as a branch of the supreme court of judicature in Dublin, and still performs its original function. The immediate success of the act was striking. Vast quantities of land were transferred from insolvent to solvent proprietors. But it did little towards assuaging agrarian discontent. The new landlords had no hold upon popular sentiment. They were much stricter men of business than their predecessors. They were on the whole more unpopular than the old landlords. Improvements in most cases were still made by the tenant, and the tenant was still without security. Thus the agrarian difficulty remained formidable.

II. The concession of fair rent, fixity of tenure, and freedom of sale.

The first change in this direction was made by the act 33 & 34 Vict. c. 46, the Landlord and Tenant (Ireland) Act 1870, of Mr. Gladstone's first administration. This act (1) gave the force of law to the Ulster custom and to similar customs existing in other parts of Ireland; (2) granted in cases of eviction not coming within such customs a compensation for disturbance, graduated so as to be most liberal in the case of the smallest farms, but limited in any case to a sum not exceeding £250; and (3) granted compensation for improvements made by the tenant, the presumption being that all improvements were made by the tenant or by his predecessor in title. Some of its other provisions, intended to assist tenants in the purchase of their holdings, will be noticed hereafter.

A much more extensive change was made by 44 & 45 Vict. c. 49, the Land Law (Ireland) Act 1881, of Mr. Gladstone's second administration. This act extended to all agricultural tenancies not under lease the benefit of the Three F's—fair rent, fixity of tenure, and free sale. The fair rent may be determined either by recourse to the land courts established under the act, or by agreement between landlord and tenant. An agreement filed in the court acquires the same force as a decision of the court. The rent thus ascertained cannot be altered during a statutory period of fifteen years, and so long as it is paid the tenant cannot be evicted. Nothing is said in the act as to the principles on which the fair rent is to be determined, except that no rent is to be charged for improvements made by the tenant or his predecessors in title. Under certain conditions specified in the act the tenant may sell his interest in the holding. A tenant of the rateable value of £150 or upwards was allowed to contract himself out of the act. The court referred to in the act was to be either the civil bill court of the county or the Irish land commission. The land commission was to consist of three persons, one of whom must have practised at the bar for ten years, and obtained the rank of a judge of the supreme court. The commission has full power to determine all questions of law or fact and to make rules of procedure. But the business of determining rents is almost entirely performed by the assistant commissioners.

The act of 1881 was amended by the act 50 & 51 Vict. c. 33, the Land Law (Ireland) Act 1887, which extends its provisions to leaseholders, and allows a temporary reduction in judicial rents fixed before 1st January 1886, to meet the fall in prices between 1881 and 1887. The importance of this act will be understood when we remember that out of 600,000 cultivating tenants in Ireland about 150,000 are leaseholders. The acts of 1881 and 1887 together have made an agrarian revolution in Ireland. Without professing to affect the landlord's proprietary right, they have rendered him practically little more than an annuitant. Under the provisions of these acts rents have been reduced upon an average from 20 to 25 per cent. The interest of the tenant now frequently sells for more than the interest of the landlord. Moreover, the ascertaining of rent, whether by judicial decision or by agreement outside the court, is a process which takes time. It will hardly be completed for the whole of Ireland before the period of fifteen years has elapsed, when it will have to begin afresh. Thus the idea of a further alleviation of his burthens is constantly kept before the tenant. When to these circumstances we add the general tendency of modern feeling about landed property, we shall see that the landlord has no security for the retention of the proprietary interest left to him, and that the acts above-named form only one stage in the Irish agrarian revolution.

III. The conversion of the tenant into a proprietor by advances of public money for the purpose of enabling him to buy his farm.

For many years past a few discerning men had seen that the Irish tenants, once set in motion, would never rest until they had become proprietors. J. S. Mill exaggerated, perhaps, the advantages of peasant proprietorship, but he was the first English economist to refute the doctrine that the peasant proprietor was necessarily poverty-stricken and thriftless. His

advocacy of peasant proprietorship was continued by other writers, and found willing listeners in the political party most hostile to the landed interest. John BRIGHT was perhaps the first public man of mark to advocate the conversion of Irish tenant farmers into proprietors. When the Irish Church was disestablished by the act 32 & 33 Vict. c. 42, 1869, he procured the insertion of clauses which gave the tenants of church lands an opportunity of purchase. One-fourth of the purchase-money was to be paid down, and the remaining three-fourths with interest at 4 per cent might be paid in sixty-four half-yearly instalments. Several thousand tenants took advantage of these clauses. The Landlord and Tenant Act of 1870, and the Land Act of 1881, contained provisions intended to promote purchase by tenants. The greater part or the whole of the purchase-money was to be advanced by the state and repaid in thirty-five annual instalments of 5 per cent. But very few purchases were effected under these provisions. By the act 48 & 49 Vict. c. 73, the Purchase of Land (Ireland) Act 1885, commonly known as Lord Ashbourne's Act, much more liberal assistance was granted to tenants desirous of purchasing. The whole purchase-money was to be advanced by the state and to be repaid in forty-nine annual instalments of 4 per cent. £5,000,000 was made available for the purposes of the act, with £5,000,000 three years later. The whole £10,000,000 was soon issued to tenants purchasing their farms. The annual instalments have hitherto been paid with great regularity. Under the Purchase of Land (Ireland) Act 1891, 54 & 55 Vict. c. 48, the landlord might be paid in government stock. The total amount of stock which might be created was limited by the provision that the annual charge for interest and sinking fund must not exceed the amount annually granted from the treasury to local authorities in Ireland. Precautions were taken to ensure the treasury against loss, and these deterred Irish farmers from availing themselves of the act. Special provisions were inserted for the benefit of tenants with small holdings and of congested districts.

The Irish Land Act 1903 (3 Edw. VII. ch. 37) amended the previous acts so as to hasten the transfer of holdings from landlord to tenant. It gave a state bonus to vendors. Under this act agreements to purchase have become very numerous. It is probable that within the present generation the great mass of Irish tenants will have been turned into proprietors. These acts alone offer any honest and peaceable solution of the agrarian problem in Ireland. The complicated mechanism of the Land Act of 1881 can hardly be permanent, and the ascertainment of rent by courts acting without definite principles and liable to external pressure, must always be an unsatisfactory process. The judicial rent may serve as a basis for the calculation of the selling value, but has no stability in itself. The landlord must be in constant alarm for what is left to him, and the tenant in constant unrest until he has acquired all.

The remedial acts above referred to are long and intricate, and cannot be fully understood without a long preliminary study. The ultimate causes of Irish agrarian disturbance are well explained in Lecky's *History of Ireland in the Eighteenth Century*. Its progress can be followed in a vast mass of parliamentary papers, the most important being the Report of the Devon Commission appointed by Sir Robert Peel in his second administration. The Report was presented in 1845.

[The literature of the subject is bulky, but in great part obsolete, owing to recent legal and economical changes. The following are a few of the more useful publications:—J. S. Mill, *Chapters and Speeches on the Irish Land Question* (reprinted from *Principles of Political Economy*, and Hansard's *Debates*).—W. O'Connor Morris, *Land System of Ireland* (Oxford Essays, 1856).—*Letters on the Land Question in Ireland* (reprinted from the *Times* in 1870).—*Land System of Ireland* (reprinted from *Law Quarterly Review*, 1888).—J. Boyd Kinnear, *Ireland*.—M. Longfield, *Tenure of Land in Ireland* (Cobden Club Essays, Systems of Land Tenure in various countries).—W. E. Montgomery, *History of Land Tenure in Ireland*.—Right Hon. G. Shaw-Lefevre, *Agrarian Tenures*.—*The Irish Peasant, a Sociological Study*, anonymous, published by Swan, Sonnenschein, and Co.—Cliffe Leslie, *Land Systems*.] F. C. M.

LAND, NATIONALISATION OF. This term is used to denote the extinction of all private proprietary rights in land and the vesting of all landed property in the state. The extinction of private property in land is one of the objects contemplated by systematic socialists who desire to give the state exclusive control over all the means of production, and to restrict private property to property in wages. But the "nationalisation" of land has also been advocated by persons who are not systematic socialists, and who are not averse to the continuance of private ownership of capital. Such persons justify their proposals on the ground that private property in land is peculiarly indefensible. Land, they argue, is not the product of human industry or ingenuity, but the free gift of nature. At the same time the value of land is increased, without any effort on the part of landowners, by the growth of population, by the accumulation of capital, by every advance in civilisation. Land, they argue, yields an unearned increment (see INCREMENT, THE UNEARNED), and this increment is intercepted by landowners who are thus enriched by the labour and parsimony of others, and levy a tax on human improvement. The wage-earner, it is alleged, rarely earns more than a scanty subsistence, and the interest on capital declines as the mass of capital in-

creases. The whole surplus accumulations of progressive communities, it is inferred, go to enrich an unproductive class. The state, they conclude, should evict all landowners, with or without compensation, and become for the future the sole landlord. In this way the unearned increment would be secured for the common good. The field of industry would be indefinitely enlarged, the production of wealth enormously increased, and its distribution so much improved that poverty would disappear and well-being become universal.

Put in this form the argument in favour of the "nationalisation" of land is an argument for the transference of the unearned increment to the state. The theoretical basis of "nationalisation" is to be found in the writings of RICARDO and of J. S. MILL. RENT Ricardo defines as "that portion of the produce of the earth which is paid to the landlord for the use of the original and indestructible powers of the soil." If this were so, rent would afford a revenue to the landlord without the landlord rendering any service in the production of wealth. Ricardo was aware, indeed, that rent in this sense is something different from rent in the popular sense, which includes remuneration to the landlord for capital expended by him upon the land. Ricardo knew that he was defining not rent commonly so-called, but that which has since been described as *economic* rent. But the popular writers and orators, such as Mr. Henry George, who have caught at his definition, have either forgotten or ignored his qualifying statements. Again, the increase of rent in Ricardo's sense of that term is due to the circumstance that the land cannot be increased in quantity, and so forms the subject of a monopoly. With the growth of population and of riches the demand for land becomes more intense, and the landowner is enabled to charge a higher price for "the use of the original and indestructible powers of the soil." The rise of rent, Ricardo says, is a symptom, but it is "never a cause of wealth." Mill, following upon Ricardo, described the rise of rent resulting from the general progress of society as the "unearned increment." He argued that as it was due to the exertions of the whole community, it should for the future go not to the proprietors of land, but to the state. Here again the advocates of "nationalisation" carry an economic theory to its extreme consequences, and propose to transfer to the state not merely all future but also all past increments of this description.

In reality we cannot be too careful how we apply abstract definitions to concrete affairs. It is undoubtedly possible to discover forms of landed property, such as mines or sites adapted for building, which may sometimes yield a large and increasing revenue without any effort or expense on the part of the proprietor. But with agricultural land the case is far different. There it is difficult to prove the existence, and impossible to measure the amount, of the unearned increment. In this country, at all events, land has been rendered fit for cultivation at a great expense to the proprietors. The rent which they now receive often represents an inadequate return upon capital which they or their predecessors have sunk even in the buildings necessary for the proper cultivation of the soil, to say nothing of improvements effected in the soil itself. In other cases it may represent an adequate return, but no more. But in these cases we cannot determine, except for a very recent period, how much has been spent in improving the land, and therefore cannot discriminate accurately between the unearned increment and the return on capital. Thus even where an unearned increment exists, any attempt to appropriate it to the state would be illusory.

Mill proposed to leave landowners in the enjoyment of whatever unearned increment should have accrued down to a given date, and to take by way of taxation only such unearned increment as should arise subsequently. But this proposal, far more equitable as it is, would not meet the wishes of those who advocate nationalisation of the land. In an old community like the United Kingdom it would leave the bulk of rent in the receipt of private individuals. Any serious decline of prosperity would deprive the state of all advantage from such taxation. If, for example, the legislature had followed Mill's suggestion, and had fixed on 1st January 1850 as the date of appropriation, it would now receive nothing from the agricultural land of the United Kingdom.

The "nationalisation" of land, therefore, would not be confined to the unearned increment. It would extend to the whole value of the land. The land might be "nationalised" either by a formal abrogation of all private rights of property or by levying on all landowners a tax equal to the rack-rent of their estates. In either case a question arises as to what compensation, if any, should be given to the evicted owners. If "nationalisation" is to deprive landowners of all return for the capital which they or their predecessors in title have expended on the improvement of their land, it would be a confiscation of the most violent and unequal kind. We may go further, and say that open and peaceable enjoyment for an indefinite time under the sanction of law and received morality constitutes a very strong claim to compensation for the loss of the unearned increment itself. "Nationalisation" of land, effected without compensation, or with merely nominal and delusive compensation, is open to the objections based on law, morals, and public policy which can be brought against the abolition of all private

property whatsoever, and to the additional objection of making one class a victim to all other classes. If effected with substantial compensation, the "nationalisation" of land becomes far less lucrative to the state, and may sometimes end in actual loss.

But let us suppose "nationalisation" of land to have been carried out on such terms of equitable compensation to evicted owners as left the state a considerable margin of revenue. Even this margin would be further curtailed by the force of circumstances. (1) In so far as the former owners were impoverished by the change, their contributions to the imperial and municipal revenues and to public charities would be diminished. (2) A great quantity of land is held by corporations ecclesiastical, municipal, educational, and charitable, rendering a variety of public services which must be provided for in other ways when the corporate estates have been confiscated. (3) A costly public department with an immense staff would have to be instituted for the dispatch of agrarian business. (4) All the permanent improvements which in England have been executed by landowners must henceforwards be executed either by the state or by its tenants. If the state is to execute these improvements, we know from recorded experience of public works that they will always be costly, and very often prove unremunerative. All the capital required must be borrowed by the state, and a heavy charge for interest and sinking fund will be placed on the newly-acquired revenue from the land. If improvements are to be executed by the tenants, they must be tempted to improve by the concession of fixity of tenure at a fair rent.

The necessity of such fixity of tenure has been fully proved by the experience of Asiatic countries. There the first condition of prosperity has been the restriction of the claims made upon the cultivator by his landlord the state. A bad oriental government lays waste the country by taking from the cultivator everything it can. A good oriental government makes well-being possible by granting the cultivator a moderate assessment fixed for a term of years. With every prolongation of the term, and with every alleviation of the assessment, agriculture improves and the community becomes richer. The comparative well-being of the people of British India is due chiefly to the circumstance that the government has reduced its demand on the farmer to what is virtually not a rent, but a moderate land-tax.

The same necessity for fixity of tenure where the state owns the land will be more apparent when we consider to what a degree the amelioration of the soil of Europe in the past has been a labour of love inspired by the sense of ownership. Capital has been lavished on the land, not always to the advantage of the owner, but almost always to the advantage of the commonwealth. The land has been the French peasant's bank and the English squire's hobby. Nor is it only money that the fond proprietor puts into the soil; he puts his mind into it also. He knows better than any other man its wants and its capabilities. He takes care that the work done upon it is done thoroughly. This vigilant affection is possible only to the man who has either full property, or an interest resembling full property in the soil.

If therefore the state is to be landlord, its tenants must have fixity of tenure on favourable terms. Once the tenants have gained this point they are part proprietors for all practical purposes, although not so described in books of law. Their interest in the land, as the experience of Ireland shows, may often sell for more than the interest of their landlord. Nor is this all. As the history of copyhold tenure and the history of Ireland in recent years have proved, the man who has become a part-proprietor never rests until he has become an exclusive proprietor. If part-proprietors are numerous they are almost certain to succeed in achieving this object.

It seems likely, therefore, that the additional revenue which would result from the "nationalisation" of land would neither be large nor permanent. It certainly would not enable the state to discard other sources of revenue. It might for a few years produce a revenue of some magnitude. But every party which could not otherwise obtain a majority would promise in turn to lessen the burthens of the rural voter. Sometimes it would be compelled to fulfil its promises, and then its opponents would be reduced to make promises still more liberal. At last the ownership of land by the state would become a mockery, and the ultimate result of "nationalisation" would have been the transfer of the land from one set of proprietors to another. In this case nothing would have been gained, at least nothing which could not have been gained far more cheaply. The state already possesses a power of taxation limited only by considerations of prudence or of justice, considerations which under any conceivable scheme must limit its exactions from the soil. Yet in England there are, at the present time, hundreds of thousands of acres which, after supplying a humble and precarious livelihood to the farmer and labourer, and discharging the rates and taxes, yield but a nominal rental to the landlord. A comparatively small increase of local and imperial taxation would virtually oust the owners of such land, and leave the cultivators hardly wherewithal to keep themselves. What more could be effected by "nationalisation" in any form?

The plan of "nationalisation," as distinct from complete socialism, has hardly attracted attention outside the United States, the United Kingdom,

and some of our colonies. It has found favour only where the exceptional economic progress of the last hundred years has added surprisingly to the value of certain kinds of land, and this additional value has been shared among a comparatively small number of owners. In a stationary country there is no such growth in value, and in a country where proprietors are numerous such growth as there is excites little jealousy.

[Ricardo, *Principles of Political Economy and Taxation.*—Mill, *Principles of Political Economy.* —Henry George, *Progress and Poverty.*—Moffat, *Mr. Henry George, the Orthodox* (a criticism of the last-mentioned work).—Marshall, *Principles of Economics.* — Seligman, *Shifting and Incidence of Taxation.* — Nicholson, *Principles of Political Economy;* the literature of socialism generally, as the fundamental principles of land nationalisation are the common property of socialist writers. See arts. on P. E. DOVE and W. SPENCE.] F. C. M.

Some further reference to Henry George's *Progress and Poverty* in relation to his proposal for the nationalisation of land is advisable here. To make this point clear, it is necessary to go back to Mr. George's theory on wages. He argues that "wages depend upon the margin of production, or upon the produce which labour can obtain as the highest point of natural productiveness open to it without the payment of rent." From this standpoint Mr. George examines in his fifth book "the primary cause of recurring paroxysms of industrial depression," and the causes of "the persistence of poverty amid advancing wealth," and arrives at the conclusion that these spring from the existence of private property in land. As Mr. George considers this not only unjust, but the cause of the evils existing in modern society, he would give no compensation to the owners, but he would give security for improvements. He would "appropriate rent by taxation." This taxation might be crushing. Mr. George states, in one place "the monopolist in agricultural land would be taxed as much as though his land were covered with houses and barns, with crops, and with stock." In another, the taxes would "fall as heavily upon unimproved as upon improved land." By adopting this plan Mr. George anticipates a removal of many of the inequalities of wealth, but he thinks that wages would rise, that the general rate of interest would rise also, that universal prosperity would follow. It is curious, though somewhat sad, to observe the various directions in which different thinkers believe they have found a universal remedy against pauperism. The endeavour reminds the reader of the search for the philosopher's stone in the middle ages. The investigation is ever fruitless, but ever attractive to the speculative mind.

This reference is to the first statement of Mr. George's opinions. In a later edition he considers that "private property in land always has, and always must, as development proceeds, lead to the enslavement of the labouring class."

The principle Mr. George advances would be equally valid against the existence of any property at all, and, however the inequality of wealth may menace civilisation, the destruction of all wealth would be fatal to human progress.

LAND, PUBLIC, OF THE UNITED STATES. The total amount of public lands owned by the government of the United States has varied greatly at different times, owing to extensive acquisitions on the one hand and sales and gifts on the other. In the course of its existence the government has possessed in its own name 2,708,388 square miles; and the largest amount owned at any one time was in 1848, amounting to 1,890,013 square miles. The public domain has its origin (1) in cessions made by the different states originally forming the union, many of which gave up large tracts of western lands; (2) by purchases or treaty cessions, as Louisiana in 1803, Florida, 1819, purchase from Texas in 1850, the Gadsden purchase in 1853, Alaska in 1867, and the Oregon cessions; (3) by the Mexican war. As settlers' rights had already been acquired within the territories annexed, it by no means followed that all the land thus brought under the American flag was part of the public domain. From the outset it has been the policy of the government to be liberal in its grants of land. Lands have been disposed of in four different ways: (1) by grants to individuals; (2) grants to states; (3) grants for internal improvements either to states or corporations; (4) sales. No attempt has been made to secure any substantial revenue from the public lands, and, when sold, but a nominal price as a rule has been charged. The total receipts from public lands from 1798 until 1893 were 283,000,000 dollars. A much larger sum, however, has been expended in the extinction of Indian titles, purchase-money for annexations, and for surveys. The economic advantages to the nation cannot be measured by the receipts entering into the budget accounts, as nearly three-fourths of the lands have been given away to soldiers as bounties, to assist corporations in the construction of railways through sparsely-settled regions, and indirectly to promote immigration through gifts to actual settlers under the Homestead Act of 1862. Generous grants have also been made to individual states for the establishment of productive funds for common-school and university education. Only very rarely has the revenue from public lands constituted an important element in the treasury receipts. The largest amounts received from this source were in 1835 and 1836, $14·7 and $24·8 millions, or about 40 and 50 per cent respectively of the total net receipts in those years. The sales at that period were exceptional, due in part to the construction of canals and railways, and the extension of banking credits. Under the Homestead Act of 1862 a citizen, or an alien who has filed a declaration of intention to become a citizen, may enter upon not more than 160 acres of unappropriated public land

and may acquire title in five years. In 1892 there were 567,000,000 acres of public lands left, of which one-half was unsurveyed. A large part is known to be arid, and can be utilised only after large public expenditures.

It is difficult to estimate the economic effects of the public land policy of the United States. It is impossible to do more than note its relation to the rapid growth of the population, especially west of the Mississippi; its influence upon rents in the east and older districts; and the mitigation of the evils arising from a too rapid congestion of population in large cities, by furnishing an immediate and attractive outlet for industrial activities.

[See Richmond Mayo-Smith in *Emigration and Immigration* (New York, 1890), p. 56: "When trade became unprofitable a man could take to agriculture. Our public land has been our great safety-valve, relieving the pressure of economic distress and failure."—*Annual Reports of the Commissioner of the Public Land Office.*—Thomas Donaldson, *Public Domain*, Pub. Doc. Washington, 1884.—A. B. Hart, "Disposition of the Public Lands," *Quarterly Journal of Economics*, 1 (1887), 169.—W. C. Ford, in Lalor's *Encyclopedia of Pol. Sci.*, 3, 460-478.] D. R. D.

LAND PURCHASE ACT. See LAND LEGISLATION, IRISH.

LAND REGISTRATION. Land is by far the most important article of commerce. Owing to its physical peculiarities it is the subject of more varied rights and interests than any other commodity. Owing to those peculiarities, also, it does not admit of being held in the same close and constant physical possession as do most movable objects. It is thus at once peculiarly important and peculiarly difficult for those who enter into transactions with respect to land, who buy or who advance money upon land, to be certain that the person with whom they are dealing has a title to that land. Where no special legislation has been devised for their assistance, intending purchasers or mortgagees must conduct for themselves and at their own risk an inquiry into the title of the intending seller or mortgagor. This inquiry may be troublesome and expensive, and does not always yield a certain result. Moreover it must be repeated as often as any fresh transaction with reference to the land is begun. Such is still the case in England. A history of the title to the land extending formerly to sixty and now to forty years, has to be made out before any prudent person will buy the land or advance money upon the land. But a special legislation may render dealings with land less cumbrous and more secure. The titles to all the land within the limits of the state may be ascertained and recorded once for all by a public agency. All subsequent transactions affecting the land may be similarly ascertained and recorded. It will then be possible, by referring to these records, to determine what persons are at any moment interested in any piece of land either as owners or as incumbrancers. No further inquiry as to title will be necessary. The past history of the title will be of no practical consequence. Such is the case in the great majority of civilised states at the present day.

In France a system of registration of deeds has existed since the reign of Napoleon I. In every arrondissement, a subdivision comparable to our poor-law union, there is a registry office. Sales and mortgages of land must be registered there, or they will not be valid as against subsequent dealings with the land. The register is public. A lease need not be registered, but in case of litigation the tribunals will not take cognisance of it without registration. The registration fee on a purchase amounts to 5 per cent. For a mortgage it varies from £1 : 5s. to £1 : 15s. For a lease it varies from 1 to ½ per cent on the net amount accruing from the lease. In Prussia the system of registration is at least as cheap and expeditious. In all cases of alienation, proprietary rights are acquired by an act of conveyance followed by registration. The conveyance consists simply of two verbal declarations at the local registry office. The registered proprietor declares his assent to the registration of the purchase, and the purchaser declares that he demands such registration. Mortgages are created in a similar manner, and a certificate of charge upon the land is negotiable. The expenses of sale and of mortgage are adjusted on very low sliding scales. Thus where land is sold for £150 the fees amount only to 12s. The time required is in ordinary cases under an hour. A somewhat similar system was established in South Australia by the late Sir Robert Torrens, and proved so successful that it has been adopted by all the Australian colonies and by New Zealand. The speed and economy both of first registration and of registering all subsequent dealings with the land are most remarkable. The registry does not give an indefeasible, but only a guaranteed title. Experience shows that the guarantee hardly ever has to be made good.

The advantages of registration have not escaped the notice of English legislators. The registration of deeds relating to land as distinct from registration of title has long been known in England. As early as the 27th year of Henry VIII. the Statute of Enrolments required all bargains and sales of freehold land to be made by deed and enrolled within six months at Westminster or in the county where the land was situated. But this act was eluded by a technical contrivance which cannot be fully explained here. Under the Commonwealth bills for the registration of dealings with land were brought into parliament, but none of them became law. In 1669 a committee of the House

of Lords reported that the uncertainty of title was one cause of the depreciation of land, and recommended as a remedy a system of registration. In the reign of Anne separate registries of deeds were established for the county of Middlesex and for the East and West Ridings of York. In the reign of George II. a similar registry was instituted for the North Riding. A registry of deeds has long been established in Scotland and in Ireland, and is highly valued in those countries. A bill for a general system of registration was introduced in 1758, but was not passed. The subject then dropped for a long time.

In 1830 and again in 1857 royal commissions reported in favour of the registration of title, and their opinion was made more impressive by the practical success of systems of registration in other countries. The first act for the registration of titles in England, known as the act to facilitate the proof of title to and the conveyance of real estate (25 & 26 Vict. c. 53), was passed in 1862 by the efforts of Lord Westbury, then chancellor. Under this act an office of land registry was established in London. Registration of title was to be voluntary. No title was to be registered unless it were such as a court of equity would consider to be a good marketable title. Once registered the title became indefeasible. The registrar was to deliver a land certificate to the person registered as having title to the land, and the deposit or endorsement of the certificate was to be effectual as a sale or mortgage of the land. This act may be said to have been a failure from the beginning. Only a few hundred titles have been registered under it. The making out of a title for registration was found to involve a far heavier expenditure of time and money than was needed to make out a title sufficient for an ordinary conveyance. In one instance the office took two years and five months to make the preliminary inquiries, and only once did it accomplish this task in less than five months. The average amount of the registration fees appears to have been about £50, and this is said to have been only one-third of the total expense incurred by owners registering. Even when the title had been duly registered, subsequent dealings with the land were not made cheaper or more expeditious. A royal commission, which reported in 1870, came to the conclusion that the act had failed because the conditions which it imposed were too rigorous. It required the person registering to show a marketable title. It required boundaries to be defined and partial interests in the land to be recorded. Accordingly in 1875 Lord Cairns, then lord chancellor, procured the passing of the Land Transfer Act (38 & 39 Vict. c. 87). Under this act any person might be registered as the proprietor of land if he could satisfy the registrar that he was *primâ facie* entitled to it in fee, and that there was possession in the same right. In this case the registration did not prejudice the enforcement of any adverse estate, right, or interest, but the lapse of time would perfect the registered title. If application were made for an absolute title, and on examination it appeared that the title could be made out only for a limited period or subject to certain exceptions, the registrar might except from the effect of registration any estate, right, or interest arising before a specified date, and register the title not as absolute, but as "qualified." In this case also lapse of time would perfect the title. It was hoped by these expedients to lessen the expense of registration, and thus encourage the public to register. But this act failed as completely as its predecessor. In 1879 a select committee of the House of Commons appointed to consider what steps could be taken to simplify title and to facilitate the transfer of land, reported as follows:—

"Various causes have been assigned for the reluctance of landowners and mortgagees to avail themselves of the act. Its unpopularity has been ascribed (1) to the absence of any power to remove from the register a title which has once been placed upon it; (2) to the disinclination of solicitors to recommend to their clients a course of dealing with their property which may tend eventually if not immediately to curtail their own profits; (3) to the general distrust of all projects of land registration, inspired by the break-down of Lord Westbury's act; and (4) to the indisposition, both of the public and the legal profession, to familiarise themselves with a new system, and to run the risk of an experiment which involves so great a departure from established usage."

The committee, whilst admitting that there might be some force in these contentions, did not think them sufficient to account for the failure of the act of 1875. They considered that the difficulty of tracing the title to freeholds, and the complexity of the interests which can be created in English land, were the gravest obstacles to its success. Mr. Brickdale, in his pamphlet on the *Registration of Title to Land*, takes a different view. He argues that the registration of title will succeed only where it is easier to prove a title to the satisfaction of the registrar than to the satisfaction of an ordinary purchaser. But this cannot be the case where registration gives an indefeasible title, for there exhaustive evidence must be required if the risk of doing injustice to the true owner is to be avoided. He argues from the experience of the Australian colonies that registration should give not an indefeasible, but a guaranteed title, in other words, a right to compensation where the person registering himself as owner *bona fide* turns out not to be the owner. Experience has shown that the cases in which compensation has to be given are very few, and that ample funds for the purpose can be raised by imposing a small fee

upon all persons who register. Mr. Morris, in his essay on the *Registration of Title*, proposes to dispense with proof of title altogether. He would have registration commence in every case with the next dealing with the fee simple after the passing of a Registration Act. The vendor and purchaser, or their respective solicitors, would appear before the registrar and make statutory declarations, the vendor that he believed himself to be entitled to sell, the purchaser that he had in fact purchased. The purchaser would then be registered as having merely a possessory title which time would ripen into full ownership. Both Mr. Brickdale and Mr. Morris hold that direct compulsion to register is unnecessary and undesirable, although Mr. Morris would give all registered transactions legal priority over unregistered.

In 1888 a further attempt to improve the existing system of registration was made by the Land Charges and Registration Act (51 & 52 Vict. c. 51). A bill for compulsory registration introduced in 1895 was dropped. The Land Transfer Act 1875 was amended by the Land Transfer Act 1897 (60 & 61 Vict. c. 65), under which a possessory title may be placed on the register, and registration of title may be rendered compulsory for sales of land within any county or part of a county by Order in Council. Such orders have been made for the city of London and county of London. The usefulness of the act is still the subject of bitter controversy. That it should prove effective is most desirable.

The principal obstacle to a large traffic in small parcels of land lies in the cost and trouble of transfer. Owing to the difficulty of transfer the bulk of the people look upon land as a luxury which they are not likely ever to acquire, and in this age all such luxuries excite envy and hatred. Vast schemes of confiscation which would be hooted down in France or Prussia are sometimes propounded in England. The only remedy is the augmentation of the number of landed proprietors, and the best means of bringing about this augmentation is to facilitate dealings in land by an efficient system of registration.

[See text of the acts above referred to.—Reports of the Land Transfer Commission appointed 1868 and of the select committee on Land Titles and Transfer appointed 1878.—R. LANDSETTUS, one of the many appellations for the peasant landholders on a mediæval manor, chiefly found in the eastern counties.

[Vinogradoff, *Villainage in England.*]

E. G. P.

LAND SYSTEM IN THE AMERICAN COLONIES. The agrarian policy of the various American colonies was largely dependent upon the character and instincts of the different groups of settlers. In the division of the soil, better even than in the forms of government, were expressed the political and social ideas of these settlers, and as these ideas varied, so did the methods of land-distribution and the forms of land-tenure. Such variations may be ascribed in part to hereditary inclinations, to the influence of habit and previous environment, and to the political ideas that had stimulated the colonists to leave England for America; in part to climate and staple products, the influence of which, though important, is likely to be exaggerated. The fitness of a territory for a given staple, cultivable only on a large scale, will militate against small holdings; while a land confined by sea and mountain, and broken by frequent ranges of hills, will not be favourable to large plantations.

The title to all lands in America claimed by virtue of discovery and occupation was vested in the Crown. The king was as absolute a sovereign of these territories as of his ancestral demesne. He disposed of them freely, and conveyed to the grantees, by letters patent, such powers as seemed to him good. Such patents were issued to petitioners, conveying to them rights in the soil and the power of free disposal of it. Lands granted in this way were held by the petitioners in free and common SOCAGE, which was the normal and typical free tenure, that is, tenure by fealty and fixed services. The most common of the latter was the payment of rent. This form of tenure was embodied in all the early charters, though the form of the rent varied. In the charter to Raleigh in 1584, to the Virginia Company of London in 1609 and 1611-1612, to the New England Company in 1620, to the Massachusetts Bay Company in 1629 and 1691, to the Governor and Company of Connecticut in 1662, and to the Governor and Company of Rhode Island and Providence Plantations in 1663, the service took the form of a payment of one-fifth of all the gold and silver. This had, however, rather the character of a reservation than a rent. The grant to Lord Baltimore in 1632 exacted, in addition to the reservation of one-fifth of all the gold and silver, an annual payment of two Indian arrows to the king at Windsor; the grant to Gorges in 1639, one quarter of wheat; the grant to the Duke of York in 1664, forty beaver skins; the grants to the proprietaries of Carolina in 1663 and 1665, twenty marks; and the grant to Penn in 1681, two beaver skins. It is not surprising that so free a

tenure should have been conceded when we realise how burdensome a military tenure would have been to settlers engaged in such distant and hazardous undertakings, how willing the Stuart kings were to offer every encouragement to these colonists, and how strong was the opinion in England—note the action of parliament in 1610—that all feudal dues and incidents should be abolished.

The patentees, whether single proprietaries, groups of proprietaries, or joint-stock companies, made subgrants to those who would co-operate directly in bringing about settlement. Such grantees might be organised as joint-stock companies, as was the case with the Massachusetts Bay Company. This company, a patentee of the New England Company, although receiving a charter directly from the king, distributed lands under certain prescribed rules to individuals and to land-communities, who had power to subdivide the land further among *bona fide* settlers. Or such grantees might be a number of proprietaries, as in the case of New Jersey, where the proprietaries received their title by a conveyance from the Duke of York — himself a patentee of Charles II.,— and having erected a frame of government, gave the governor and council of the new province the power to distribute lands to individuals, but retained in their own hands the privilege of granting town-patents. In the majority of cases, however, the first patentees, whether a single proprietary, as in Pennsylvania, Maryland, and New York, a chartered company, as in Connecticut and Rhode Island, or a group of proprietaries, as in Carolina, conveyed title, either directly or through the governor or deputy-governor, to those who were to be the final owners of the soil, if individuals, or to those to whom was entrusted the task of further division among themselves, if members of a land-community.

The methods according to which lands were distributed differed in detail, but in general were much the same everywhere. The scheme of division based on the share-right, that is, the right of each shareholder to a certain amount of the newly-discovered territory, and to a share in the profits of the venture, was the outcome of the joint-stock system. In Massachusetts Bay there was allowed to each subscriber of £50, 200 acres; in New Jersey to every armed freeman who shared in the settlement, 150 acres; in Maryland to each adventurer bringing over ten additional persons, 1000 and later 2000 acres; in Carolina, in 1669, to each free-born individual over sixteen, 150 acres. This system was easily extended by the grant of additional acres for each new settler transported to the colonies, for each man-servant or woman-servant possessed, for each apprentice or indentured servant, or for each member of a family, especially children. Such methods are inevitable when land is plentiful and a rapid increase of population desired. In addition to these grants of fixed amounts extensive grants were made to individuals who were of rank in the colony, or had performed meritorious service. Lastly, grants were made to communities of settlers who desired to establish towns. In Connecticut and Rhode Island the last two forms of distribution were the only ones employed. In Pennsylvania, in the laying out of a town, grants were made to "first purchasers" according to a fixed agreement at the rate of ten acres to every 500 purchased. Any attempt at systematic distribution seems to have been given up at an early date in Pennsylvania. The proprietary and the land-office acting in his absence seem to have disposed of the territory at their own will and pleasure.

Lands thus granted were in the northern colonies generally held in FEE (*q.v.*). In Massachusetts Bay there were a few instances of grants for life or for rent. In the other colonies a small QUIT RENT was demanded. This was in New Jersey and Carolina a half-penny to the acre; in Pennsylvania for the "first purchasers," one shilling, though later the rent dropped to one penny or half-penny an acre. In Maryland the quit-rent was first paid in kind, four hundred pounds of wheat; later the amount was diminished, and money sterling substituted for the wheat rental. In Virginia a rental of one shilling, to be paid after seven years in agricultural commodities, was imposed; this, after 1688, was paid in tobacco at the rate of one penny per pound. In South Carolina it was a penny per acre before 1694, after that date one shilling sterling per one hundred acres until 1731, when the old rate was restored. All such rentals, of course, lapsed with the independence of the colonies, and all landed property became alodial freeholds (see ALOD).

In none of the charters issued were the rights of the Indians, the native occupiers of the soil, recognised. The Crown claimed absolute and positive sovereignty. Nevertheless, the opinion was held very generally by the colonists and by others that the natives should not be dispossessed of their property without some compensation. Extreme views, however, were held on both sides. Cotton Mather said it was unnecessary to recognise the Indian claims at all, and later lawyers denied that the Indian deed created a title, holding that it was no more than a quit-claim, the fee being in the king. On the other hand, Roger Williams and the New Jersey squatters claimed that titles based on Indian purchase were alone worthy of consideration. In nearly every case, however, the colonists purchased their lands of the Indians for small amounts of merchandise, and protected the natives in the fields and

hunting-grounds reserved for them. Cases of hard treatment and actual dishonesty were fortunately not common. Titles that rested on Indian deeds only had to receive the sanction of the local courts or of the colonial assemblies, while some of the colonies were obliged to forbid unlicensed purchasing entirely, because of the confusion caused by it. Massachusetts Bay forbade it in 1633, Rhode Island in 1643, Maryland in 1649, Connecticut in 1663. Virginia discouraged sale by the Indians of their lands, but in New Jersey the number of titles that rested on Indian deeds only was so large as to lead to serious dispute followed by riots in 1749. Reservations and even towns were set apart for the Indians by many of the colonies, but, inasmuch as the Indian question was an ever-recurring one, a considerable mass of legislation was called into existence in settling it. The eastern Indians, yearly decreasing in number, continued to occupy their reservations till long after the revolution. To-day a few half-breeds still linger in the territory of the original colonies, but the lands owned by them are very small in extent.

After this general view of the land system in the American colonies, a more detailed examination of the Virginian and New England system is necessary. By the charter of 1609 the Treasurer, Council, and General Association of Adventurers in England were authorised to divide the soil of Virginia according to such methods as they might prescribe, employing the governor and council in Virginia as ministerial agents. The requirement to send all patents to England for confirmation involved so much delay as to retard seriously the growth of the colony, and with the recall of the letters-patent in 1624, the power fell into the hands of the royal governor acting for the Crown. There were three grounds upon which a grant might be issued: First, the purchase of a "bill of adventure," by which the purchaser of a single share at £12:10s. was entitled to 100 acres in the first division of the soil, and 100 acres in addition when the first plantation was seated. The purchasers of bills before 1625 were exempt from quit-rent. Of the original subscribers it is estimated that about two-thirds, either in person or through agents, took up their lands, while one-third sold their rights to others. By means of extensive purchasing of shares on the part of private associations, engrossing of lands began on a large scale; but after 1624 the associations were unable to maintain their position, and, with the dissolution of the company, these lands fell into the hands of private individuals. The second ground was the performance of some meritorious service. The recipients were generally officers of the state, clergymen, physicians, and others. To these the company, and afterwards the Crown, gave large portions of land, in the form either of shares or, after 1624, of money. Special grants were made to the governors who became in time the agents of the Crown in dispensing like favours to those of lesser rank. To those who guarded the frontiers every inducement was offered, and large quantities of land situated along the border were patented to single individuals or groups of men. The third ground was the head-right, that is to say, any shareholder or other person who transported an emigrant to the colony was allowed fifty acres. The object of this was to increase the population, and to promote individual ownership in the soil. This method of distributing land became very much more common after 1624. Abuses crept in, and on many pretexts it became possible to obtain land without having transported a single emigrant. This abuse was connived at because of the feeling in Virginia that a simpler method of acquiring title should be adopted. The economic growth of the colony demanded the abolition of such expensive methods, and those who were desirous of bringing new land into tillage did not wish to be hampered by unnecessary burdens. Thus it took Virginia over fifty years to reach that policy of land-distribution which the New England colonists had been employing since the beginning of the settlement. The size of the portions allotted in Virginia increased with the growth of the colony. From 1634 to 1650, though the largest grant was for 3500 acres, the average area of soil acquired did not exceed 446 acres. From 1651 to 1700 the average size of the patents was 674 acres, though individual patents ran as high as 20,000 acres. The only conditions attached to such grants were, first, that the land be seated, that is, that a small house or cabin be erected upon it, and a portion of the soil tilled; secondly, the payment of quit-rent to the amount of 1s. per 50 acres after seven years had passed, reckoning from 1618, the date of the adoption of the law. Settlers were exceedingly remiss in the payment of this rental, as was the case in all the colonies where it existed, for they did not like it, and sought by every means to evade it. Failure to fulfil these conditions, particularly the first, caused such land to escheat to the Crown, as did also lands of intestates who died without heirs. There existed, in consequence, at various times in Virginia large amounts of forfeited territory, for which new patents were constantly granted.

Thus it will be seen that Virginia was a land of large individual holdings, and it will also be noticed that these holdings tended to become larger. This was due to the nature of the colonists, the character of the country, and the conditions of agriculture. There scarcely existed the small land-communities, through

whose agrarian activity and methods of subdivision a system of small freeholds was introduced. For these we must look to New England, and must follow the process of land-distribution one step farther.

In addition to the gifts to individuals, the colonial authorities of Massachusetts Bay, Connecticut, and Rhode Island made grants of territory to groups of men bound together by ties of blood, religion, and common political ideas. These groups or companies were organised on a joint-stock basis for the purpose of purchasing the land necessary for the establishment of a town. To these men the purchase of the lands of the Indians was a duty higher even than that of obtaining a title from the Crown. For this purpose a common fund was raised, to which all those who were to join in the undertaking subscribed. After a grant had been obtained from the colony the land was purchased. It was then divided slowly, as need required, the share of each being chiefly determined by his contribution to the common fund. This share was called the "purchase right," and was generally, though not always, expressed in pounds. The "purchase right," while corresponding in a sense to the "bill of adventure," nevertheless differed in two particulars. First, the amount of land given was determined not only by the amount of money subscribed, but also by the size and importance of the family of the subscriber. A "purchase right" was therefore in part a family holding. Secondly, the "purchase right" was not a certain amount of land taken up all in one piece, as was the land taken up under a Virginia patent, but it was a bundle of separate shares situated in many parts of the village territory, and a right to the enjoyment of privileges common to all. In the earlier days the "purchase right" included a right to a homestead, a right in every important division of land, a right to use all lands left common for pasturing sheep and cattle, a right in all woods for the masting of swine and gathering of timber, and a right to share in whatever resources the town possessed, such as fisheries, vineyards, mines, etc. This definition of the "purchase right" shows that in dividing their lands the New England proprietors had before them two objects. First, equity, which was to be obtained by making the divisions as equal as possible. Engrossing of lands was thus prevented. Secondly, such an increase of population as would bring about a rapid cultivation and improvement of the soil. Both of these objects were to be attained by a system of small and scattered holdings only. The system of this kind with which the colonists were familiar was that of the English village community, and therefore the plantations of New England reproduced that system as nearly as possible. The lands were divided into long and narrow fields, called variously tiers, furlongs, shots, squadrons, and quarters. These were subdivided into lots ranging from one acre to forty or more in size. Adjacent to these fields, which formed the chief arable land of the community, were meadows, divided in severalty, yet thrown open, like the LAMMAS LANDS (*q.v.*) of old England, after haying-time. There were also the common pastures for sheep and cattle, and the outlying waste and wilderness. The "purchase right" gave to the holder scattered lots in the majority of fields, in this respect corresponding to the YARDLAND of the English VILLEIN; it also included sub-rights in all common lands and undertakings. The common rights in New England differed from those in some parts of old England, notably at Ashton and Cote (Giles, *History of Bampton*, p. 76), in that they were probably appendant to the homestead only and never to the person. The rights in undivided lands could, however, be retained by persons living outside the town, though even this was denied by some of the colonial lawyers, who asserted that such rights were appendant to the homestead only. Inasmuch as the commons in some of the towns were not divided into severalty until the end of the 18th century, there arose frequent disputes between the towns and the descendants and assigns of the old proprietors regarding the ownership of these lands.

Thus it will be seen that while in Virginia the soil was divided into large plantations varying from 200 to 20,000 acres in size, in New England it was divided into petty holdings as small as one acre or even half an acre in size. In Virginia a quit-rent was demanded; in New England the land was held in full ownership, limited only by certain liabilities to forfeiture in case of alienation or removal. As the colonies became better established, and the economic condition changed, all these restrictions on full ownership were removed. This had been done in New England by the middle of the 18th century, while in the other colonies all proprietary rights, manorial obligations, quit-rents, forms of primogeniture, entail and intestacy escheat, were abolished in 1776. The form of freehold tenure, thus defined by the different state laws and constitutions for the settled and cultivated lands, was extended by the ordinance of 1787 to the unoccupied lands of the nation. These lands, by the peace of Paris in 1783, had ceased to be Crown lands, and, after the state cessions of 1785 to 1790, had been taken in trust by the government of the United States for the benefit of the whole people.

[No systematic, compact account of the land system in all the American colonies has as yet been written, nor can a satisfactory knowledge of it be obtained from the material thus far printed.

Histories of the United States pass over the subject almost entirely. Much information can be obtained from town and colonial records and from local and state histories. The charter regulations can be found in Poore's *Charters and Constitutions*, Washington, 1878. There is a small amount of information in Winsor's *Narrative and Critical History*, vols. iii. and v. The only systematic attempt to investigate the subject will be found in the *Johns Hopkins Studies in History and Political Science*, as follows: vol. i., "The Germanic Origin of New England Towns," "Parish Institutions of Maryland," "Old Maryland Manors"; vol. iii., "Virginia Local Institutions," "Maryland Local Institutions"; vol. iv., "Dutch Village Communities on the Hudson River," "Pennsylvania Boroughs," "History of the Land Question of the United States" (this work is of importance for the period after 1776 only), "The Land System of the New England Colonies"; vol. vii., "The River Towns of Connecticut; vol. xiii., "Government of the Colony of South Carolina." See also Howard, *Local Constitutional History of the United States*, Baltimore, 1889.—Sargeant, *Land Laws of Pennsylvania*.—Brown, *Genesis of the United States*, Boston, 1891.—Weeden, *Economic and Social History of New England*, Boston, 1890.—Bruce, *The Economic History of Virginia in the Seventeenth Century*, New York, 1895; and an article in the *Zeitschrift für Sozial und Wirthschaftsgeschichte*, vol. ii., entitled, "Die Stadt in Neu-England, ihr Ursprung und ihre agrarische Grundlage."] C. M. A.

LAND TAX. The origin of the existing land tax in England is usually referred to the year 1692, when the valuation was made on which the quotas subsequently fixed were based. In that year parliament, discontinuing the system in force during the civil war and the Commonwealth, under which a specified sum was raised from each county and from certain towns by the MONTHLY ASSESSMENTS, directed by the act 4 W. & M. c. 1, the levy of a definite rate of 4s. in the pound—the same as for SUBSIDIES on land in Tudor times—on the true yearly value of all personal estate, offices, lands, tenements, and hereditaments in England, Wales, and Berwick-on-Tweed. Adopting in the main the machinery used in raising the monthly assessments, the act provided for a valuation of the subjects of charge by parochial assessors to be appointed by the commissioners named for putting the act in execution.

The yield of the tax as thus levied (£1,922,712) fell short of what was anticipated, owing doubtless to incorrect returns, and year by year it showed such a tendency to decrease that, in 1697, parliament found it desirable to revert to the system of granting a definite total sum to be paid in specified amounts charged in the act upon counties and certain named towns. A total sum of £1,484,015 : 1 : 11¾, as for a rate of 3s. in the pound, was granted, and the commissioners were directed to set down the several proportions which, *in their judgment*, ought to be charged upon every hundred or other division towards raising the amount charged on the whole county or town. In every hundred or division the particular sum required was to be levied, first, by a rate of 3s. in the pound on the assumed income from goods, merchandise, and personal property—every £100 in value being considered to represent an income of £6—and on income from offices; and *the residue of the sum* by a pound rate on the annual value of real estate. In the following year, 1698, a similar total sum was granted, but on account of the difficulties that had been experienced in apportioning the amounts fixed for the counties and towns among the various hundreds or divisions, the act making the grant, 10 W. III. c. 9, directed that each hundred or division should contribute the same proportion that it had paid under the assessment for 1692, the year when a new valuation was made.

The tax thus originally intended to bear in the first instance on personal estate and offices was subsequently, when personal property—though always by law primarily chargeable—had in practice almost entirely slipped out of assessment, described as an "aid by a land tax," or, in fiscal expression, "the annual land tax." It was granted in the same form, but at rates varying between 4s. and 1s. according to the exigencies of the times, for the next hundred years, the proportions for the hundreds and divisions remaining as fixed by the valuation of 1692. That valuation was very unequal even at its first establishment, and the lapse of years necessarily made it more so. Complaints of inequality were therefore frequent, but as, with the growth of the towns and the improvements in agriculture, the tax had become in most districts light compared with the nominal charge of 4s. or less per pound annually imposed, there was no general demand for a revision.

In November 1797 the usual act (38 Geo. III. c. 5) was passed granting the land tax (£1,989,673 : 7 : 10¼ for England, Wales, and Berwick-on-Tweed, as for a rate of 4s. in the £) for the service of the following year, and on 2nd April 1798 Pitt produced his plan for the redemption of the tax, which was brought into operation by the act 38 Geo. III. c. 60. Pitt's object was to diminish the pressure of the funded debt in the market by causing the absorption of a large amount of stock; and to effect this so much of the land tax as by the act for 1798 was charged on the several counties and towns in respect of lands, tenements, and hereditaments was made perpetual, subject to redemption. Redemption was to be effected by transferring to the commissioners for the reduction of the national debt for cancellation

so much 3 per cent stock (2¾ per cent stock substituted by 52 & 53 Vict. c. 42-59) as would yield a dividend exceeding the land tax to be redeemed by one-tenth part. This amount of stock consideration was reduced in 1853 by 17½ per cent. As the result of redemption, the property became exonerated from land tax, provision being made, however, that in certain circumstances the charge should be kept on foot for the benefit of the redemptioner. The amount of tax redeemed in the years 1798 and 1799, when stock stood at an average of 56, and the price payable represented 20¾ years' purchase of the charge, was, for England and Scotland, £435,888, nearly a quarter of the whole charge, but in after years the progress of redemption became slow. It was quickened in 1896 when, by the Finance Act of that year, a simple payment amounting to thirty years' purchase of the tax was substituted for the cumbrous system of redemption previously existing. By the same act the maximum rate of charge was reduced from 4s. to 1s. in the £1, and by the Finance Act 1898 exemption was allowed to owners in receipt of total incomes not exceeding £160 a year, whilst an abatement of half the charge was granted to those with incomes not exceeding £400. The loss to the revenue from these remissions was estimated for 1904-5 at £238,577, leaving £726,158 as the approximate amount of tax then collectable in Great Britain. There is no land tax in Ireland.

The existing quotas of land tax, subject, of course, to future redemptions and to the relief by way of exemption or abatement above mentioned, are required to be raised by an annual assessment at an equal pound rate not exceeding 1s. on all the unexonerated lands, tenements, and hereditaments within the areas charged with the separate quotas. It may here be mentioned that, as respects the period between 1697 and 1798, the quotas fixed for each hundred or division were required by law to be assessed *equally* within every parish or place within the hundred or division, although in practice effect was not always given to this requirement. But in the important case of Regina *v.* Land Tax Commissioners for Tower division, it was decided by the Court of Queen's Bench in 1853 (2 E. and B. 694) that the act 38 Geo. III. c. 60 fixed, as from 1798, *a separate quota for each parish or place*, and that there was no power to equalise the quotas payable by the several parishes or places within any division. The net amount of the fixed quotas is paid over as part of the inland revenue, any surplus unavoidably raised being applicable to the remuneration of the assessor and the redemption of the quota for the particular parish or place. The tenant of the property is the person required by law to pay the tax, but in the absence of agreement to the contrary he is entitled to deduct the amount out of his rent. There are certain exemptions for hospitals and colleges.

As before stated, personal property, originally placed in the forefront of the tax, gradually slipped out of assessment. In 1798 the remaining charge was found to amount to a little over £5000, and this charge was continued by Pitt in the various districts subject to it till 1833, when it was repealed. That part of the old land tax which was collected from offices, and which amounted in 1798 to about £126,000, was also then continued as a separate annual grant, finally disappearing in 1876, except as regards certain salaries charged on public revenue.

The existing land tax in England is described by Giffen, *Essays in Finance*, 1st series, p. 242 :— "As a fixed charge upon land for generations, it is now past all controversy a rent-charge. In many instances it has long since been redeemed, the property having subsequently changed hands ; in others, inheritors of property have acquired it under the burden, and have calculated their income minus the tax, while purchasers, in buying, invariably allow for it. To reduce (abolish ?) it now would be to present the landowners of England with a capital sum of nearly £30,000,000. Their estates, relieved of the burden, would become at once so much more valuable, and if they did not sell, they would pocket an additional income which they never inherited or paid for."

[Dowell's *History of Taxation and Taxes*, 2nd ed. vol. iii. bk. ii. ch. i.—Bourdin's *Land Tax.*—1st, 13th, 28th, 43rd, and 48th Reports of Commissioners of Inland Revenue (see TAXATION).]

F. A.

LAND TENURES (or LANDLORD AND TENANT IN THE UNITED KINGDOM). The relation of landlord and tenant springs out of a contract by which the proprietor of land lets it on hire for use by some other person. Under this contract the proprietor is entitled to payment for the use of the land,—a rent whether in kind or in money, and the tenant acquires certain possessory rights in the land available against third parties as well as against the proprietor. Experience has shown that as a rule the proprietors of large estates can make more out of their land by thus letting it for hire than by dealing with it in other ways. The high cultivation of the land involves an expenditure of capital to which the proprietor may be unequal, it also requires special knowledge which the proprietor may not possess, and close personal supervision which he may not be able to give. Hence proprietors are naturally led to devolve on other men who have the requisite knowledge and capital the business of utilising the land, and in order to obtain their assistance concede to them at least for a time exclusive rights of possession and enjoyment. Unlike the bailiff or caretaker, who is a mere living instrument of the proprietor, the tenant is the legal occupant of a

given parcel of land, and can exclude the interference of the proprietor himself.

On the other hand, the landlord has very generally possessed special means of recovering his rent from a tenant who has fallen into arrear. The ordinary creditor has not, in the absence of express agreement, any mortgage on his debtor's property. But Roman law gave the landlord a HYPOTHECA or implied mortgage on the tenant's stock, so that he could satisfy his claim out of it in preference to other creditors. English law allows the landlord the extrajudicial remedy of distraint. Without going into court he can distrain on the goods and chattels found on the farm for which rent is due. He is entitled to sell the goods thus seized, and to satisfy his claim out of the proceeds of the sale. By the AGRICULTURAL HOLDINGS ACT of 1883, the landlord is prevented from distraining for more than a year's rent, and from taking by way of distraint machinery or live-stock which, although found upon the farm, belongs to a third party.

It follows almost inevitably from the independence of a tenant, as compared with a labourer, that he should supply part of the capital required for the cultivation of his holding. He must at least find his own tools, and keep himself alive until the first crop sown by him becomes marketable. This seems to be all the capital required by that class of metayers who receive from their landlords the whole of the stock for their farms (see MÉTAYAGE). But usually the tenant supplies much more than this small capital. He may supply the whole of the stock. Or, besides supplying the stock, he may spend a considerable sum in keeping the land fit for cultivation, and this expenditure will increase rapidly as INTENSIVE CULTIVATION (*q.v.*) becomes general. Finally, he may defray the expense not merely of keeping the land in order, but also of what are termed permanent improvements, such as drainage and farm buildings,—this last case is practically unknown in England.

In so far as the tenant's capital is spent on the lasting improvement of the land, he has a moral and may have a legal claim to compensation.

In considering the relation of landlord and tenant we have to take account of three things: the mode of fixing the rent, the duration of the lease, and the compensation to be paid for tenant's improvements.

1. *The Rent.*—The rent to be paid by the tenant may be fixed in various ways. It may be fixed by competition, the landlord offering a vacant farm for the highest rent obtainable. This method is commonly adopted in England. But in England, though most farms are let from year to year, it has been the general practice of good landlords to allow a satisfactory tenant to remain in possession, practically in perpetuity. Again the rent may be merely nominal, but coupled with the obligation to pay a large fine whenever the lease is renewed. This is the principle of the beneficial lease formerly common in England, especially on the estates of corporate bodies, but now fallen into desuetude. Again the rent may be fixed at a certain proportion of the gross or net produce of the holding, as in the metayer tenure. In all these cases the rent is determined by the agreement of the parties. In other cases the rent may be customary. Long lapse of time may have rendered it unalterable, in spite of changes in the value of money or an increase in the demand for farms. Again the rent may be judicial—fixed periodically by a court on an estimate of what a man of average capacity can fairly pay for a given piece of land. But judicial determination of rent only takes place when there is a dispute between a tenant in possession and his landlord as to what rent should be paid.

Each of these modes of determining rent has its peculiar advantages and disadvantages. The fixing of rent by competition works very well in a country like England, where there are many other industries beside agriculture, and where, as farming is carried on, the competition for holdings is limited to men of some capital and special training. Under these conditions it gives landlords every motive for spending pains and money on their land so as to enhance its letting value, whilst it stimulates the tenants to farm the land effectively, or in default admits abler men to carry on the work of cultivation. But where the needful conditions do not exist, where agriculture is almost the only industry, where competition for land is fierce and irrational, where landlords are often not improvers and frequently are absentees, the system of competitive rents does not promote good farming and excites much ill feeling. In Ireland the competition for land in many cases induced the offer of a rent which could never be paid, and assisted in multiplying a miserable and lawless rural population. The system of beneficial leases seems more indulgent to the tenant, but it destroys the landlord's interest in improving his land. When it was in common use in England, the lands let on beneficial lease compared generally very unfavourably with the lands let at a rack-rent. The method of fixing the rent at a proportion of the produce has the advantage of roughly adjusting the tenant's payments to his means, and reducing the rent in an easy automatic manner when agriculture becomes less profitable. It has the further advantage of making the landlord as it were a partner with the tenant, and of interesting him directly in the improvement of the land. Where rent has been fixed by custom the landlord has no interest in the improvement of the land, and the progress of agriculture depends wholly on the skill, capital, and industry of the tenant who is secure of any surplus which he can extract from his farm. But custom operates chiefly in poor communities where agriculture is not progressive. The judicial determination of rent assures to the tenant in possession a full return for all improvements made by him, but it also secures him against the competition of abler men who might do better with the land, and hence removes incitement to improvements. It has no benefits for a new tenant who comes in after paying a full competitive price for his predecessor's tenant-right, for the interest on the sum so paid

when added to the judicial rent will often equal and sometimes even exceed a full rack-rent. Under this system the landlord's control over his land and sense of enjoyment in it are so much reduced, that he is apt to do nothing more for the improvement of his estate and to sink into a mere annuitant. The periodic determination of the rent causes recurring friction, and the constitution and procedure of the court become the playthings of political parties. The system of judicial rents, probably, can hardly be more than exceptional and temporary.

2. *The Duration of the Lease.*—This may vary from one year to a practical perpetuity. An agricultural tenant must occupy the land at least for a year in order to derive any return from his labour. For this reason the English courts have caught at any pretext for turning a mere tenancy at will into a tenancy from year to year. Through the operation of the Agricultural Holdings Act a tenancy by the year virtually secures the enjoyment of the land for two years. But much more important, as mentioned before, is the custom of all good landlords not to disturb a satisfactory tenant. There are many instances in England of a farm let nominally from year to year which has remained in the hands of the same family for several generations. Leases for a term of years are common in England and much more frequent in Scotland and Ireland. The Settled Land Act 1882, empowers every tenant for life to grant agricultural leases for a term of twenty-one years. The lessee for a term of years has evidently a strong incentive to industry in the earlier years, but he is apt to relax his efforts during the later years of his term. Yet the large farms of Scotland, the best of their class in the world, have usually been held for a short term of years. Leases for long terms are not unknown in the United Kingdom, and the Roman contract of EMPHYTEUSIS was practically a lease for ever. The tenant could never be disturbed, provided he paid his rent and did not lay waste the holding. Where the rent has been fixed by custom, the tenant has a virtual lease for ever. Where the rent is determined judicially, it must be reassessed at moderate intervals. In Ireland the interval was fixed by the Land Act of 1881 at fifteen years, but a bill has been introduced this year (1895) for reducing it to ten years. As a general rule, it may be laid down that where landlords have the means and the will to improve the land, leases for moderate terms will suffice to ensure high farming, but where landlords are not in the habit of making improvements leases for longer terms are desirable. Tenancies from year to year are compatible with high farming only where custom gives an additional security to the tenant.

3. *Compensation for Tenant's Improvements.*—The general rule is that the property in the soil includes everything which is affixed to, or embodied in, the soil. If a tenant gives up possession, therefore, he loses any right to his improvements. But, as this is inequitable to him and injurious to agriculture, he ought to receive compensation. Again, if he is to be compensated for his improvements he should be obliged to obtain the landlord's consent for making them, as otherwise he might compel the landlord to reimburse him for reckless and fanciful expenditure. Compensation may be either direct or indirect, customary or legal. If the tenant has a lease for a term of years at a low rent he may be regarded as receiving indirect compensation for the improvements which he has executed. If he pays a competitive rent, compensation must be direct and must be paid him on quitting the farm. In England custom has generally thrown on the landlord the burthen of making the most durable and costly improvements, and has sometimes given compensation to out-going tenants for improvements which they had made. But it was found necessary to supplement custom by legislation (see AGRICULTURAL HOLDINGS ACTS).

Where the tenant enjoys fixity of tenure at a judicial rent no special legislation is needed to ensure compensation for his improvements.

The relation of landlord and tenant in the East, particularly in India, differs greatly from that in western Europe. A few words only can be given to it here. Baden-Powell's great work on *Systems of Land Tenure and Land Revenue in British India*, contains much information. Baden-Powell appears to have proved that neither Mohammedan nor Hindu jurists had a clear conception of property in land, and in consequence the several interests of the different classes who live on the land have never been defined with the legal precision customary in Europe. The relations subsisting between those whom we should call landlords and tenants differ in different provinces. It has been the policy of the government to recognise the claims of actual occupants, and to give them what might be called a tenant-right. This is said to have been the intention even of Lord Cornwallis and of those who assisted him in the permanent settlement of Bengal, although it was not carried out till many years afterwards. But the subject of Indian tenures is too extensive and too intricate to be discussed within the limits of this article. To illustrate European institutions by Indian parallels, though always attractive and sometimes useful, is generally unsafe.

The relation of landlord and tenant in the case of mines or of buildings presents certain peculiar features, for which see MINES; ROYALTIES.

C. M.

LAND BANKS, SCHEMES OF, IN ENGLAND, 1695-96. A rival banking scheme to that of the Bank of England. The idea of it was first broached by Hugh CHAMBERLEN who, in November 1690, issued from his house in Essex Street the first draft in his "proposal to make England rich and happy." In the session of 1693 he brought the proposal before the Scottish parliament, and in the month of July it was

examined by a committee. In this form of his scheme Chamberlen proposed, against a conveyance of an estate for 150 years, to create bills to the value of 100 years' rental, 40 years' rental to be advanced on loan and rental to the landowner, 30 years' rental to form the capital of a joint-stock for the benefit of subscribers, 10 years' rental to be advanced to government as a loan, and remainder for working expenses. The scheme not passing the Scotch parliament, it was brought before the English parliament in December 1693, but slightly altered. Subscribers were to convey £150 rental for 150 years to secure a loan of £100 per annum for 100 years, and in addition to exchange £1000 in gold or silver for the intended company's bills, thus £400 in allotment, £300 at end of first year, £200 at end of second year, and £100 at end of third year. For this he would receive in the company's bills £1000 down, £1100 at end of first year, £1200 at end of second year, £1300 at end of third year, and £1400 at end of fourth year. Of the £10,000 loan created, therefore, the conveyor got £6000, another £3000 was to form a joint-trading stock, the remainder was for government loan and working expenses.

The scheme was taken up by the tories out of rivalry to the whig Bank of England (see Kennet, and Burnet, "*a new ballad of the land bank, or credit restored*," published c. 1696, in which Harley and Foley are especially mentioned), and a huge scheme was launched by which the land bank undertook to raise a loan of £2,564,000 for William's government. The scheme received the sanction of parliament in April 1696, after bitter opposition from the Bank of England. By the act 7 & 8 Will. III. c. 31, the duties on salt, glass, etc., and tobacco pipes were appropriated to form a fund to raise £179,480 per annum, being interest on the proposed loan. By the act the subscription was to be closed before 1st August 1696, and half the loan was to be subscribed before the incorporation of the company. The bank was further to lend £500,000 on land securities.

The deed declaring the constitution of the "Office of land credit" was sealed 10th August 1695, but not enrolled in chancery till 15th July 1696. The provision on the first draft of the scheme as to the exchange of £1000 in gold was omitted and other details altered.

Before parliamentary assent to the scheme the subscription had been opened on the 25th October 1695. It met with no response, was closed, and again opened on the 18th November with like effect, and a third advertisement was tried on the 20th December. The 6th number of the "monthly account" of the bank, issued 7th January 169$\frac{6}{7}$, says that since the 25th October £40,000 had been lent out on land security. This must be looked upon as distinct from the institution established by the act of April 1696. Subscriptions for the latter were to open 25th May 1696, and the first meeting of subscribers was called 8th June. From the first it proved a total failure. Kennet says the scheme did not produce a penny, and was a serious blow to credit generally (see Macaulay).

Chamberlen in 1700 and 1705 again brought his schemes before the Scotch parliament, but in vain.

RIVAL SCHEMES.—1. That of John BRISCOE, presented to parliament in 1694. Offered to subscribers bills to the value of $\frac{2}{3}$ of the estate settled, at £3 : 0 : 10 per cent interest. Coupled with this were proposals for raising £1,000,000 for government aid. Not receiving the sanction of parliament Briscoe opened his subscription without it (11th June 1695). By the 13th July 1695 estates to the rental of £29,460 were subscribed, by 27th July £51,438, by 3rd August £60,270, by 2nd December over £200,000, the estates being drawn from almost every county of England and Wales. According to Briscoe's assertion, also, of the million loan £650,000 was subscribed. There is no further evidence as to the progress of the project.

2. A scheme drafted in a tract undated and unsigned, entitled "An account of the office for transferring and discounting land bills" at Hercules Pillar, Fleet Street, near Temple Bar. Owners of land to draw $\frac{2}{3}$ value of estate conveyed, in bills discountable at 1 per cent 6 months after the registration of the estates. To provide a fund for discounting, the manager to be empowered to call in 10 per cent or more of the value of all the estates registered.

3. An anonymous "Proposal for erecting a general bank which may be fitly called the Land Bank of England" 1695.

4. Nicholas BARBON is said to have founded a land bank, which on the 15th August 1695 was going on successfully (Luttrell's "relation"). On the following 4th February 169$\frac{5}{6}$ this coalesced with Briscoe's bank.

5. Thomas Dalby, "Propositions for general land banks," an undated pamphlet signed as above (of 1695 almost certainly). He proposes two alternative schemes—(1) funds not to exceed $\frac{1}{4}$ of rental of lands engaged, (2) land banks secured by a parliamentary fund of which he gives a sample scheme.

6. John ASGILL, who was accused of plagiarism of Briscoe's ideas, proposed an anonymous scheme in tract entitled "To the knights, citizens, and burgesses in parliament assembled, a short scheme or proposal for a National Land Bank." Landowners to subscribe £4,000,000, $\frac{1}{4}$ of this to be government loan and the fund of the bank. Landowners to have $\frac{2}{3}$ value of estate advanced, viz. on £100 rental £1200 in money at £3 : 0 : 10 per cent. (This is apparently Briscoe's.)

LANDES-CREDITKASSEN. Government mortgage banks established in some parts of Germany, chiefly for the purpose of assisting peasant proprietors (see MORTGAGE BANKS).

E. S.

LANDING-WAITER is the name which, in the customs departments of the United Kingdom and the colonies, denotes the officer who receives and checks imported goods at the place of landing. The rules of the department in Queen Elizabeth's reign show that the *waiter* was the officer who superintended importation, as distinguished from the *searcher* who looked after exports—who "waited on" the lighters which brought the goods to the pier. Later the term became *land-waiter* and then *landing-waiter*.

[See *First Report of Commissioners of Customs*, 1857.] C. A. H.

LANGE, FRIEDRICH ALBERT (1828-1875), was born at Wald near Solingen in the district of Düsseldorf. He was son of Dr. J. P. Lange, well known as a theologian and a professor at Bonn. His father was called to Zürich, and the boy's early youth was spent there. He went to Bonn to study philology and philosophy; after teaching for some time at Cologne, he returned to Bonn as *privat-docent*. From 1858-62 he was master in the gymnasium at Duisburg, but resigned this position when the government forbade teachers to take a part in political agitation. His deep interest in the social and economic questions of the time led him to engage in several journalistic enterprises, always showing himself a decided adversary of reaction. After a residence of some years at Winterthur in Switzerland, he became, in 1870, professor of inductive philosophy at Zürich, and in 1872 accepted an invitation from the minister Falk to fill the chair of philosophy at Marburg. His health began to fail, but he continued to work energetically, lecturing and writing, till the end came. Personally, he appears to have been a man of singularly pure and elevated character, with high moral ideals, and filled with zeal for the advancement, and especially the enlightenment, of the working classes.

Lange is most widely known by his *Geschichte des Materialismus*, 1866 (afterwards remodelled and largely rewritten), which was translated into English by E. C. Thomas, 1877-81. His principal economic work is *Die Arbeiterfrage in ihrer Bedeutung für Gegenwart und Zukunft beleuchtet*, 1865, republished in 1870 with considerable changes, especially with a larger element of theoretical discussion. It is this work which has led to the position assigned him as one of the scientific socialists. His socialism is of a peculiar type, making him an interesting, but also a somewhat perplexing figure. He is repelled by the pervading egoism of the existing system of society, and looks forward to a better organisation, but does not adopt any of the dominant popular creeds of his day. Accepting the proposition that competition tends to force wages down to a minimum, he yet does not wish to abolish the wage system. He does not admit Marx's theory of value, nor does he approve his project of expropriation. He holds the *Konsum* and *Vorschuss-vereine* of Schulze-Delitzsch to be an altogether insufficient solution of the social problem, but rejects also the productive associations of Lassalle, except for agricultural exploitation. Malthus he regards as an immature forerunner of Darwin, and refuses to explain human development by the struggle for existence which prevails amongst the lower animal races; indeed, as he pointedly says, the contemporary labour movement is in its essence a "struggle against the struggle for existence." He is more critical than constructive, and represents a transitional and indeterminate stage of sociological opinion.

Besides his *Arbeiterfrage*, Lange published the following economic writings:—*Jedermann Hauseigenthümer*, 1865, intended to naturalise in Germany the system of the English building societies; and *J. S. Mill's Ansichten über die sociale Frage und die angebliche Umwälzung der Socialwissenschaft durch Carey*, 1866, "the best general estimate of Mill as an economist."—Bonar, *Philosophy and Pol. Econ.*, 1893.

LANGENSTEIN, HENRY OF (1325-1397), also called HENRICUS DE HASSIA from his native country in Germany. He was some time lecturer and vice-chancellor of the university of Paris, and from 1383 to 1397, the year of his death, professor in Vienna, where he was invited by the archduke Albert III. of Austria, founder of the faculty of theology in the high school of Vienna. Langenstein's *Tractatus de contractibus et de origine censum* is inserted in Joh. Gerson's *Tractatus diversi* (vol. iv. fol. 185-253), Cologne, 1484.

Langenstein is a staunch upholder of the mediæval canonistic views. By means of taxes, the temporal powers should maintain the *justum pretium*, taking, however, into account local considerations, the condition of men, and the disposition of the times. A few discreet elders (*discreti senes*) have to compute, after a careful examination, what each man actually wants according to his *status*, for *status* is more exacting than nature. Every commercial transaction must be based on the *equality of quantities*. He extends the prohibition of usury to the Jews, but would allow them to apply themselves to crafts, trade, and agriculture.

The purchase of rent-charges, very prevalent in Germany during the middle ages, as it allows men to live in idleness, is sinful, excepting as a way to provide for one's old age or as a remuneration of services rendered to the church or state. He also objects to the redemption of rents on the basis of a return of 12½ per 100 as dishonest.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, pp. 18-21, and Brants, *Les Théories Économiques aux XIII.e et XIV.e Siècles* (Louvain, 1895), pp. 71, 81, 119, 175, and 201.] E. Ca.

LAPSE OF TIME AS CREATING OR EXTINGUISHING RIGHTS. In most legal systems the mere lapse of time has been allowed some effect in creating or extinguishing rights. This principle has taken two forms—acquisition by prescription, and limitation of actions (see LIMITATION, STATUTES OF:

PRESCRIPTION). Prescription plays a more important part in Roman than in English law. Under the early civil law land might be acquired by two years', and movables by one year's uninterrupted possession. By the law of Justinian, ten years' uninterrupted possession gave property in land, if the person against whom the possessor claimed lived in the same province. But if he lived in another province, and, therefore, was less able to protect his rights, twenty years' uninterrupted possession was needed to turn the possessor into an owner. Three years' uninterrupted possession was necessary in the case of movables. But in all cases something more than the mere lapse of time was needed to transfer ownership. The possessor must have acted *bonâ fide*, believing himself to be entitled to the thing possessed, and his possession must have had its origin in some act which, if performed by the true owner, would have given him a legal title to the property, *e.g.* gift, sale, exchange, bequest. The later Roman law, however, recognised that mere uninterrupted possession for a very long period might by itself confer ownership. In English law prescription was not recognised as a means of acquiring property, except in the case of EASEMENT or SERVITUDES, *e.g.* right of way, right of water, right of ancient lights. Even here it was necessary to show enjoyment from time immemorial, *i.e.* from the first year of Richard I., although, where this could not be done, evidence of enjoyment for a long time past was admitted as proof of a lost grant of the right in question. Finally, the Prescription Act 1832 (2 & 3 Will. IV. c. 71) put the matter on a rational footing, by recognising the right of a person who had enjoyed the easement for a specified time—forty years in the case of a right of way, or twenty in the case of a right of light. The enjoyment must not have been merely by permission, nor by force, nor by stealth. By the limitation of actions is meant the loss of a right to sue which is not exercised within a given time. This principle was recognised in the later Roman law, but is much more prominent in English law. Thus at the present day every species of civil action, except an action against a fraudulent trustee, must be brought within a limited time. An action for the recovery of land must be brought within twelve years of the time when the right of action accrued. An action for breach of a simple contract must be brought within six years; an action for breach of a contract under seal within twenty years. Actions for TORT (*i.e.* civil injury) must be brought within the time fixed by statute in each case. It will be noticed that the limitation of actions does not, like prescription, transfer a right of property from one person to another. It only takes away from the aggrieved person the most effectual means of asserting his right. Thus if A owes B a debt for which B cannot sue because he has let the time slip by, and if A for any reason afterwards pays B a sum of money without mentioning the purpose to which it is to be applied, B can apply the money to payment of the time-barred debt. But it has been provided by statute that when the right to bring an action for the recovery of land has been lost by lapse of time, the title to the land shall also be extinguished. The lapse of time for the purpose either of prescription or of limitation of actions is always interrupted by any acknowledgment of the right of the party, against whom time is running, made by the other party.

The principle which underlies both prescription and limitation of actions has been keenly discussed by jurists. Some have argued that the loss of rights by lapse of time is a just penalty upon the person who neglects to enforce them, whilst others have laid stress upon the hardship of disturbing a long-continued possession, which is generally innocent, and others upon the public interest in limiting litigation. Litigation is at best a costly and uncertain remedy for wrong. But the longer the time which has elapsed since the right of action accrued, the greater becomes the expense and the smaller the chance of finding out the truth. He who does not set about asserting his right of property or obtaining redress for his wrongs within a reasonable time probably suffers little in losing his remedy.

The principle of prescription has a political as well as a merely legal application. History contains many instances of wholesale violence and injustice, revolutions, conquests, and confiscations which dispossess not a few individuals, but whole multitudes in order to enrich a crowd of new possessors. But when these changes have received the sanction of time, a statesman, however much he may deplore them, will not attempt to undo them by any sweeping act of restitution.

Catastrophes such as the Norman Conquest of England, or the English Conquest of Ireland, or the French Revolution, cannot be undone. Even if the old possessors of the land or their descendants had all their title-deeds in order, restitution could not be made except as the result of a prolonged civil strife. The new settlement has become the basis of innumerable transactions and is interwoven with immense interests. Remedial legislation for the social evils which it has generated may be most necessary. But such legislation must be based on the principle that no private person is responsible for the public crimes of a past generation. So far as there is any responsibility for those crimes, it rests upon the whole community, which is therefore bound to bear the burthen of whatever compensation to the victims or to their descendants may be thought just or necessary.

LA RIVIÉRE, MERCIER DE. See MERCIER DE LA RIVIÈRE.

LA ROCHEFOUCAULD LIANCOURT, ALEXANDRE FRÉDÉRIC, Duc de (1747-1827). Before the French Revolution he lived on his estates, where he busied himself with agriculture, was elected in 1789 a member of the national assembly, fled to the United States during the Reign of Terror, and published on his return the result of his observations in his *Voyage aux États unis d'Amérique fait en 1793-1798* (Paris, 8 vols. 1800).

He was one of those who attended the dinners of the *Économistes* at the home of the Marquis de MIRABEAU, and always took a zealous and active interest in questions of public and private charity. He published a condensed translation of Eden's *History of the Poor*, for the *Recueil de Mémoires sur les Établissements d'humanité* of DUQUESNOY (*q.v.*) (vol. vii., Paris, 1799-1804). His other publications are *Finances et crédit* (1789).—*Notice sur l'Impôt territorial en Angleterre* (1790 and 1804).—*Plan du comité pour l'extinction de la mendicité présenté à l'Assemblée Nationale* and *Travail du comité de mendicité* (both 1790).—*Les Prisons de Philadelphie* (1796 and 1819).—*Notes sur la législation anglaise des chemins* (1801) and a *Statistique Industrielle du Canton de Creil* (Senlis, 1826). A letter of his to Adam Smith is given by Dugald Stewart (see *Cat. of A. Smith's Library*, Macmillans, 1894). A. Smith's reply will be found in *Econ. Journ.*, March 1896. E. CA.

LA ROCHEFOUCAULD LIANCOURT, FRÉDÉRIC GAETAN, Marquis de (1779-1850). He was the son of the Duke of La Rochefoucauld who lived 1747-1827, and a member of the French house of deputies during the reigns of the restored Bourbons and of King Louis Philippe. He wrote almost exclusively on subjects connected with prison administration.

Mémoires sur les Finances de la France en 1816.—*Examen de la Théorie et la Pratique du système Pénitentiaire*, and as a sequel *Conséquences du Système Pénitentiaire* (1842).—*Examen du Projet de Loi de la Réforme des Prisons* (1844).—*De la Mortalité Cellulaire* (1844). E. CA.

LARRUGA, EUGENIO DE (about the middle of the last century), born in Saragossa, was placed by King Charles III. at the head of the government departments of the mines, the mint, trade and manufactures. He published, with the financial assistance of the king, his *Memorias políticas y económicas sobre los frutos, comercio, fábricas y minas de España* (Madrid, 45 vols., 1785-1800), a most copious source of documentary information on the economic policy followed in Spain from the reign of Philip II. to the author's own time. In his *Discurso Proemial* (preface), Larruga puts forward his own views as a steadfast opponent to the interfering and meddlesome spirit which animated Spanish princes and statesmen since the accession of the House of Austria; he lays great stress on the necessity of basing economic reasoning on accurate and extensive knowledge of facts. E. CA.

LASSALLE, FERDINAND (1825-1864), born at Breslau, the most conspicuous amongst the founders of the social democratic party in Germany. An able and brilliant man, he earned notoriety at an early age in connection with a social scandal, was conspicuous for his energy as an agitator and the vigour of his defence in repeated political prosecutions, and was killed at thirty-nine in a duel. His speculative activity, which was considerable, was devoted rather to general social philosophy and constitutional jurisprudence than to abstract economics, in which his views coincide generally with those of RODBERTUS or MARX, and have little originality. His earliest controversial pamphlet (1849) is his defence on his trial for incitement to resist the unconstitutional collection of taxes. In 1857 he published a treatise *Die Philosophie Herakleitos dargestellt*, reflecting the Hegelianism which underlay his own political philosophy. In 1859, *Franz von Sickingen*, a drama of the Peasant Revolt, indicated an approach to a less ideal attitude towards the social problems of his own generation, and a pamphlet on *The Italian War* further emphasised his growing absorption in the German revolutionary movement. Writings on constitutional and social philosophy followed, including the important *System of Acquired Rights* (*Das System der erworbenen Rechte.* Brockhaus, Leipzig, 1861). In 1862 he plunged deeper into burning economic and industrial questions in his *Working Men's Programme.* In this and in repeated similar utterances he combated the individualist philosophy, and the "laissez faire" political doctrine which the "Manchester school" had founded on abstract economics, asserting, against their "policeman's idea" of the state, the organic conception of the state as "the unity of individuals in an ethical whole," . . . furnishing individuals with an indefinite variety of "means for attaining a degree of culture, power, and freedom that would be to every one of them as individuals absolutely unattainable." He insisted that "by an iron and inexorable law . . . under the domination of supply and demand, the average wages of labour remain always reduced to the bare subsistence which, according to the standard of living of a nation, is necessary for maintenance and reproduction," that the preaching of "self-help" was idle in the face of the efficiency of consolidated capital, and produced only "the repulsive caricature of working men with working men's means and employers' minds," and that the only avenue towards freedom for the wage-

earning class lay through the application of its political power to the employment of the credit of the state in furnishing capital for productive enterprises to be carried on by democratic associations of workers. S. O.

In February 1863 Lassalle was invited by the Central Leipzig Committee to summon a general congress of the working men of Germany to meet in that city for the purpose of preparing a programme of labour agitation. He published an *Open Letter of Reply*, in which he dwelt on what he called the iron or "brazen law" (*ehernes Gesetz*) of wages, already laid down by Turgot and Ricardo, but which he stated in an exaggerated form—namely, that the remuneration of the labourer can never differ much from the minimum regarded in any state of society as necessary for the maintenance of his life and the continuation of his family. Hence he infers that the workman is entirely excluded from the benefits of the growing productivity of labour which accompanies the progress of civilisation. To improve his position he must get rid of the *entrepreneur*, and become himself a capitalist. And, to this end, productive associations of workmen must be founded, and the government must supply them with the capital, or credit, necessary for their operations.

In the same year Lassalle opened a correspondence with Rodbertus, hoping to win his co-operation; but, though their ultimate aims were similar, no argument could convince Rodbertus that the plan of productive associations with state credit would do any real good, nor any importunity induce him to admit that the socialists should be a political as well as an economic party.

In 1864 Lassalle published his *Herr Bastiat-Schulze von Delitzsch, der ökonomische Julian*, a clever but somewhat coarse production, in which he attacked Schulze-Delitzsch, an honourable and useful man, for the principles he had borrowed from Bastiat, and denounced his system of co-operation as an utterly insufficient solution of the labour problem, expounding at the same time his own views and vindicating his practical proposals. In this book, which had for second title *Capital and Labour*, occurs the celebrated passage in which he ridicules the "abstinence" theory of profit in what Böhm-Bawerk calls "his tumultuously eloquent, but absurdly rhetorical way." "The profit of capital," he says, "is the wage of abstinence! Happy, even priceless expression! The ascetic millionaires of Europe! Like Indian penitents or pillar saints they stand: on one leg, each on his column, with straining arms and pendulous body, and pallid looks, holding a plate towards the people to collect the wages of their abstinence. In their midst, towering up above all his fellows as head penitent and ascetic, the Baron Rothschild! This is the condition of society! How could I ever so much misunderstand it?" (See Böhm-Bawerk's *Capital and Interest*, Eng. tr. by W. Smart, p. 277.)

Lassalle's principles have not continued to find favour with the German social democrats; they have been supplanted by those of Karl Marx, who is now the undisputed oracle of the party. These two writers are in several respects contrasted. Lassalle was patriotic in his sentiments; at the time of the Italian war he had called on Prussia to take the opportunity of breaking with Austria and establishing German unity; "gross-Deutschland *moins les dynasties*" was his programme. Marx was cosmopolitan, and inspired the German socialists with the international idea. Lassalle was idealistic, and appealed to social justice. By Marx the necessity and nature of the predicted revolution were founded on the laws of the material development of society, as he conceived them. Lassalle was a believer in the ability and duty of the state to interfere for the protection of the working class against capital, and to introduce the new era which he regarded as about to open. Marx rejected the help of the existing state, and looked for a direct transformation through democratic force of the whole organisation of society.

Lassalle is said to have shown himself an original thinker by his work in the field of jurisprudence, but he is certainly not such in economics. He derived his principles, with eclectic freedom, from the English economists, from Louis Blanc, or from Rodbertus and Marx; the last, indeed, asserted that all the general theoretical propositions in his works had been borrowed from his (Marx's) published writings, and that he had not always understood them aright.

It was as an agitator that Lassalle was really great; of the names *Denker* and *Kämpfer* written on his tomb, he deserves the latter much more than the former. He created the German labour movement, and gave to it in its early days much of his own fire and energy. He also stimulated the growth of state socialism; it is thought by some that he influenced in this direction the views of Bismarck, who admired his talents and enjoyed his conversation. All must admit that he rendered at least one permanent service—that of fixing the attention and interest of all classes of the population on what is known as the social question. There was much that was unsound alike in his intellectual and moral character; he was more showy than solid, inordinately vain and arrogant, and somewhat theatrical in his public manifestations, and had little self-control or moral scruple; but he was true to the cause he took in hand, and fearless in its advocacy; and his action on his followers, though misleading, was not degrading.

[The best edition of his collected writings is that begun in 1892 by E. Bernstein. His letters to Rodbertus have been separately published, with a preface by Prof. Wagner. One of the best biographies of him is that by G. Brandes, a Dane, which has been translated into German—*F. Lassalle, ein litterarisches Charakter-bild*, 1877; 2nd ed. 1879. English readers will find a full and trustworthy account of him and of his political activity in *German Socialism and Ferdinand Lassalle*, by W. H. Dawson, 1888. Mr. George Meredith's *Tragic Comedians* is founded on the story of Lassalle's life, and a short biography of him is prefixed to the novel in the edition of 1892.

In the present sketch Diehl's article in the *Handwörterbuch der Staatswissenschaften* and Plener's in the *Allgemeine Deutsche Biographie* have also been consulted, and the former largely used. See also Bonar's *Philos. and Pol. Econ.*, 1893.—Rae, *Contemporary Socialism.*] J. K. I.

LASTRI, Marco (18th century). A Tuscan abbé and writer. For students of economic and statistical sciences his researches on the population of Florence are important as an early collection of statistics. Lastri worked through the baptismal registers of San Giovanni, Florence, and collected a long list of baptisms (1451-1774) from which, by calculating the proportion between births and population, he endeavoured to estimate the population of the commune of Florence. The researches of Lastri, which are based on sound statistical information, and permeated with a good knowledge of the literature of the subject, were continued by Zuccagni Orlandini down to the present century, when, in 1818, a system of civil registration was introduced into Tuscany and a regular census commenced.

LATHES (of Kent), a very old division of the county, perhaps representing shires existing at the time of the heptarchic kingdom of Kent. The six lathes or "lests" found in Domesday do not quite correspond with the five modern districts of the same name. Three or more hundreds go to make a lathe, which, like the riding of Yorkshire and Lincolnshire, and unlike the rape of Sussex, was a judicial division, with a court higher in dignity and power than that of the hundred, lower than that of the county. The name of lath is found also applied to a court held for the management of Romney Marsh.

LATIFUNDIUM, a word used by Pliny and a few other classical authors to denote a large landed property, estate, or farm. It is not to be confused with the *latus fundus* of the *gromatici* (see Territorium). The effects produced by the proprietorship of large extents of the soil of Italy falling into a few hands are discussed by J. E. T. Rogers in his *Industrial and Commercial Hist. of Eng.*, p. 248, but the same subject is far more satisfactorily dealt with by Dr. Cunningham in his *Growth of English Industry*. Neither author has, however, given any measure of the excess to which this system had run under the Roman Empire, although the former quotes the well-known passage in Pliny's *Natural History*, xviii. 7: *Verumque confitentibus latifundia perdidere Italiam, jam vero et provincias. Sex domini semissem Africæ possidebant cum interfecit eos Nero princeps.*

Pliny here asserts that six persons owned half of the province of Africa—the modern Tunis—meaning, no doubt, the part known as Zeugitana, a region so fertile that its plains furnished Rome with its principal supply of grain. There may be exaggeration in the passage, but, roughly estimating Zeugitana at 8000 square miles, and assuming that an unusual proportion was waste, we find that each owner must have possessed some hundreds of square miles of corn-producing land. This would seem scarcely credible were it not for Seneca's words: *amnes magni, magnarumque gentium termini, usque ad ostium a fonte vestri sunt. Hoc quoque parum est nisi latifundiis vestris maria cinxistis.*

These words, though somewhat rhetorical, show that *latifundium* is, in truth, a term which belongs to geography rather than to land-surveying. Such tracts were cultivated by organisations controlling large bodies of men, originally slaves, later either slaves or serfs. The disadvantages of slave labour are shown in Pliny's words, *coli rura ab ergastulis pessimum est.* Whatever opinions may be held as to the relative merits of large and small farming generally, there can be no doubt that cultivation on the scale of the *latifundia*, by so notoriously inefficient a means as slave labour, must have been wasteful in the extreme.

This bad system, which prevailed in Italy as well as in the provinces, grew up, as Dr. Cunningham states, through the dying out, under the pressure of many wars, of "the old type of Roman citizen, who cultivated his own land and also fought in the armies of the republic." "Some," he adds, "were killed off, and many more were utterly impoverished, so that the old system of proprietary cultivation was superseded by the *latifundia* cultivated by dependants." It thus appears probable that when Pliny charges the system with ruining Italy, he points no less at the wastefulness of the slackened cultivation, which the surveillance of a single master could never render energetic, than at the loss of a sturdy race of free peasants who tilled the soil and defended their native country. The Licinian Rogations of 367 B.C., by limiting estates and insisting on the partial use of *free* labour, show how early these bad effects were felt.

The growth of this vast greed of land is described by Mommsen (vol. ii. pp. 397, 398, and vol. iii. pp. 427, 428). He treats specially of the *latifundia* in the second part of his *History of the Provinces*, pp. 333-334.

LATIMER, HUGH (1472-1555). Latimer lived at a most interesting period in English history. The son of a yeoman, he rose to take a prominent position in his university (Cambridge) and the church, and he had ample opportunity of observing the changes which were going on in every rank of society and in many parts of the country. His views on economic as on other subjects are contained in his *Sermons*, and are either introduced by way of illustration, or are covered with fervid rhetoric like that of the Hebrew prophets denouncing the evils of their day. It was in this spirit that he attacked the progress of ENCLOSURES, and the proceedings of landlords who enhanced their rents. But his remarks on the coinage show that he understood the evils of a debased currency much more clearly than some of the professed financiers of his time, and that he was by no means a mere rhetorician, but a man who had thought carefully on the topics on which he spoke so forcibly. In this view, there seems to be considerable probability in the opinion put forward by Miss LAMOND, in her edition of the *Discourse of the Common Weal of this Realm of England*, that Latimer is the original of the doctor in that dialogue, and that the views expressed by Pandotheus may be attributed to him. His justification of competition is the only point in which the doctor goes beyond Latimer's known views, but this is not really inconsistent with the bishop's opinions so far as known.

[*Sermons* (Parker Society).—*Discourse of Common Weal of Realm of England.* Introduction, xxi.] W. C.

LATIN UNION (amounts in francs converted as 25 = £1). This name designates the monetary union organised in 1865 between France, Belgium, Italy, Switzerland, and (1868) Greece. Its originators and many of its leaders have continually had in view a greater international union that would eventually include the leading powers of Europe and accomplish some of the advantages that a uniform monetary system would bring. With these propagandist ends in view it may be questioned whether the name was well chosen, and whether the term "Latin" has not been the means of keeping out other nations than those of the Latin peoples. At all events, in the twenty-six years since Greece joined there have been no new members admitted. The union exists for purposes of maintaining a uniform and interchangeable coinage circulation among the five states which compose it, according to its treaty stipulations and the regulations adopted by its various conferences. Its basis is the French monetary system as established by the law of 7 Germinal An XI. (1803), with the franc composed of five grammes of silver nine-tenths fine as its unit. Subsequent treaties have altered the theoretical importance of this original decision, and have modified the real basis considerably.

In the four countries that organised the union there existed already for many years a similar coinage system, patterned more or less after the French system, and providing for full legal-tender gold and silver coins. Though no formal agreement existed, the coins of one of these countries circulated freely in the others. During the period immediately following the great gold discoveries in California and Australia, gold came freely to the mints which had a bimetallic basis. Public opinion feared a deluge of gold. A tendency to hoard silver and to underestimate gold made itself felt. Gold fell slightly in value. Silver coins began to disappear, especially the five-franc pieces, and a dearth of small change in silver coins, which were also full value silver and not token coins, was manifest. Some measure to protect silver was necessary. Switzerland was the first to act. By law of 31st January 1860 she made the five-franc piece instead of the franc her monetary unit, and reduced all smaller silver coins to token coins by making them $\frac{8}{10}\frac{0}{0}\frac{0}{0}$ fine. Italy, by law of 24th August 1862, took a similar course, except that she reduced the fineness of only the franc, fifty centimes and twenty centimes pieces to $\frac{8}{10}\frac{3}{0}\frac{5}{0}$ fine. Finally a French law of 24th May 1864 reduced the half-franc and twenty centimes pieces to $\frac{8}{10}\frac{3}{0}\frac{5}{0}$. Belgium alone maintained the old $\frac{9}{10}$ standard for all her silver coins, and of course she suffered most from the changes that were taking place. She therefore was the first to propose a remedy, though the time was ripe in other countries also, because three different standards of fineness for the small coins existed, and they did not circulate freely in all four countries as of old; commerce felt the strain; bankers' premiums became a disturbing element. Moreover, a kilogram of silver ($\frac{9}{10}$ fine) was now worth 200 francs (£8) in Belgium, 185·55 francs (£7 : 8 : 5½) in France and Italy, and only 177·77 francs (£7 : 2 : 2½) in Switzerland. Belgium proposed that delegates from all the four countries having the franc for their basis should meet in Paris to discuss some measure for united action. The other three governments accepted, and the conference thus called ended its labours by signing the first Latin Union Treaty on 23rd December 1865. Ratifications were exchanged at Paris, 19th July 1866, and it went into effect 1st August 1866.

The treaty only affected gold and silver money, and in general provided as follows: (1) for coinage of gold $\frac{9}{10}$ fine in coins of the denominations of 100, 50, 20, 10, 5 francs with specified weight for each, proportional to 1·61290 grammes for the five-franc gold piece; (2) for coinage of following silver coins, the five-franc piece $\frac{9}{10}$ fine, 25 grammes in weight; pieces of 2, 1, ½, ¼ francs based on one gramme of silver for the twenty centimes piece, $\frac{8}{10}\frac{3}{0}\frac{5}{0}$ fine. The legal tolerance and size was also

prescribed for each coin. All token coins not made according to these regulations were ordered to be withdrawn from circulation before 1st January 1869, except the Swiss two- and one-franc pieces coined in conformity to the law of 31st January 1860. All gold coins and the silver five-franc pieces were made legal tender in the public treasuries of all the states of the union so long as the effigies originally stamped on them had not disappeared, nor their weight been reduced by wear below ½ per cent for the gold coins, and 1 per cent for tolerance of the silver coins after deducting legal tolerance. The small silver coins were made legal tender for payments not exceeding fifty francs within the state in which they were coined, and were to be received without limit by the public treasuries of the state that coined them when presented by its citizens. The same coins must be accepted by the public treasuries of other states in payments not exceeding one hundred francs. The token coins were to be redeemed at any time at their nominal value, in gold or silver five-franc pieces, by the issuing state, when presented in amounts not less than one hundred francs by another state or by private parties, and this clause to continue in force for a period of two years after expiration of treaty. The total amount of subsidiary coins (2, 1, ½, ⅕ franc) issued by any state shall not exceed a sum equal to six francs per inhabitant. This sum, estimated not according to actual, but probable population at date of expiration of treaty, was fixed at 239,000,000 (£9,560,000) francs for France, 141,000,000 (£5,640,000) for Italy,[1] 32,000,000 (£1,280,000) for Belgium, and 17,000,000 (£680,000) for Switzerland; these figures to include the coins already issued by France under law of 1864, estimated at 16,000,000 (£640,000); by Italy under law of 1862, estimated at 100,000,000 (£4,000,000); by Switzerland under law of 1860, estimated at 10,500,000 (£420,000). The states agreed to furnish each other annually full information respecting their coinage and monetary condition. Any state might enter the union thus formed by simply accepting the gold and silver coinage system provided for in the treaty. The treaty was made to run for a period of fifteen years, and if notice for its termination was not given by any contracting state one year before the expiration of this term, it would continue in force for a further period of fifteen years, and so on from period to period of fifteen years each. Greece notified the union in 1868 of her adherence to the terms of the treaty, but she was not able to coin money at once, and did not, in fact, become a member of the union until 1876. The extraordinary events in Italy in 1866, and in France in 1870-71, causing a forced circulation of paper money for a time, interfered somewhat with the satisfactory development of the union. Of greater moment, however, was the change that soon took place in the value of silver. In the two years following 1866 the five-franc piece was an over-valued coin, and almost disappeared from circulation. In 1867, however, eighteen states, assembled in international conference at Paris, expressed themselves in favour of a single gold standard, and the great rush for gold commenced. Holland and Germany began to unload great quantities of silver on the Latin union, thus withdrawing its gold until general alarm was felt. Especially in Switzerland did this remelting and exchange process take place. The coinage of all four states, however, showed abnormal increase in output of five-franc pieces in the year 1873. Preliminary preventive measures were taken by France and Belgium independently of the union, and a new conference was called, which assembled in January 1874. At this conference Belgium reported that her coinage of five-franc pieces since 1866 had amounted to 463,000,000 francs (£18,520,000), of which 111,000,000 (£4,440,000) were coined in the year 1873; France had a total of about 400,000,000 (£16,000,000), and in 1873 had coined 154,000,000 (£6,160,000); Italy in a total of 160,000,000 (£6,400,000) for past five years, 42,000,000 (£1,680,000) in 1873. Belgium had already suspended coinage of five-franc pieces by law of 18th December 1873; France had limited it by ministerial decree (1873), first to 280,000 francs (£11,200) a day, and then to 150,000 francs (£6000); Italy had lowered her tariff in order to make coinage of five-franc pieces less profitable. A general proposal, therefore, to sanction these acts and for the future to limit the coinage of five-franc pieces met with universal favour. A new treaty, dated 31st January 1874, provided that coinage of five-franc pieces for the year 1874 should not exceed 120,000,000 francs (£4,800,000) divided as follows: France, 60,000,000 (£2,400,000); Italy, 40,000,000 (£1,600,000); Belgium, 12,000,000 (£480,000); Switzerland, 8,000,000 (£320,000); these figures to include the outstanding "bons de monnaie" (mint certificates for bullion not yet coined), amounting to 40,000,000 francs (£1,600,000) for France, Belgium, and Italy. Switzerland declined to coin any at all. Italy was accorded some special privileges on account of large silver reserve in bars held by her national bank, which wished to profit by coining it at once before the price of silver experienced a further fall, and also for the recoinage of a large number of old Bourbon silver coins which the Italian government was withdrawing from circulation. The new treaty put a restriction on the right of admission of new parties to the union, making it conditional on consent of all contracting

[1] After the war of 1866, when the territory of the kingdom of Italy was enlarged, this quota was raised to 156,000,000 francs (£6,240,000) by an Italian law of 1868, which was later approved by the other states of the union.

parties. The Bank of France and the National Bank of Belgium had closed their doors to the five-franc pieces, and the new treaty expressed the desire that they, as well as the public treasuries, should accept them. They agreed in letters to their respective governments to do so for one year. A better arrangement was adopted whereby statistics and information concerning the monetary circulation in the states of the union could be obtained, as the clause to this effect in the treaty of 1865 had remained a dead letter. France now assumed the presidency of the union for purposes of publication of such information. It was further agreed to hold annual conferences at Paris.

The situation in January 1875, when the third conference met, was much the same. Silver had continued to fall in price, and the product increased. Switzerland favoured further limitation of coinage. France and Belgium preferred to continue the arrangement adopted for the year 1874, which was done, the banks of France and Belgium continuing their agreement also. However, in compliance with Italy's request for more latitude in her recoinage, and in order to keep all states on the same footing, each state was authorised to coin one-fourth more than its quota for 1874. Italy was granted some further favours in that she was permitted to put in circulation the 20,000,000 (£800,000) reserve already coined under agreement of 1874 and held by her national bank. Switzerland again voluntarily renounced a possible profit by refusing to coin at all. The wisdom of her course is shown by her better position in possible case of dissolution of the union as regards the liquidation clause which was later adopted.

The conference of 1876 decided to return to the old 120 millions (£4,800,000) limit adopted in 1874, and of this sum Greece was allowed a disproportional share, amounting to 12 millions (£480,000), to enable her to fall in line with the system of the union. The banks renewed their obligation.

In 1877 a still more radical change was accomplished without a conference by diplomatic correspondence, the contracting parties agreeing to entirely suspend the coinage of five-franc pieces. The outlook was not a hopeful one, and not until November 1878 did the states assemble in a new conference, to consider the knotty problems that presented themselves. The condition of the silver market was appalling; the relation of the two metals had undergone a greater change since the commencement of the union than had occurred for centuries. Paper money, for which the union made no provision, was a source of trouble in several of the states. The date for the expiration of the treaty was near at hand. Therefore the conference of 1878 decided to regulate silver coinage for the year 1879, and then to adopt a new treaty, to go into effect in 1880. As for 1879, Belgium, Greece, France, and Switzerland agreed to coin no five-franc pieces, but Italy insisted on being allowed a quota of twenty million francs, in order to issue new coins with head of her new king; this was granted, and all five states then agreed to issue no "bons de monnaie" during the year. The chief features of the new treaty were—(1) the suspension of coinage of five-franc pieces, until, by unanimous consent of the contracting parties, it should be resumed; (2) a slight change in the apportionment of subsidiary coinage, still maintaining the six franc per inhabitant basis; (3) a special clause respecting paper circulation in Italy, by which the Italian government agreed to annul all notes for less amounts than five francs, and the other states agreed to collect and return to Italy all her minor coins in their territory; (4) special provision for the carrying out of Article 8 of treaty, providing for return of Italian coins, in which France was to be the banker from whom Italy was to redeem the same; (5) the new treaty was to remain in force for six years (to 1st January 1886), but if no notice has been given one year in advance, it is to continue from year to year, in all events to remain in force one year after notice of its termination has been given. A liquidation clause was discussed, providing that, in case of dissolution, each state would redeem in gold its five-franc pieces held by the other states. This did not meet with much favour, and no action was taken until 1885. Switzerland and Italy wished foreign coins to be made legal tender in France and Belgium, not merely in public treasuries, but also for individuals, as had long been the case in their territories, but France refused. The banks of France and Belgium, however, renewed their obligation for the whole period of the new treaty. In the next few years Switzerland had so large a part of her coinage in foreign silver that she desired some agreement on the question of what would be done in case of dissolution. She, therefore, in 1884, gave notice that she wished to terminate the treaty at date of its expiration, but was willing to consider proposals for a new one. A conference met at Paris, 20th July 1885, and 6th November signed a new treaty, which Belgium did not adhere to until a month later (12th December). No great change was made in arrangements adopted in 1878, except as regards the important liquidation clause, which caused the Belgian delegates to leave the conference. This clause provided that each state, in case of dissolution of the union, shall redeem from every other state of the union its five-franc pieces in five-franc pieces of the state presenting them, or in gold or convertible paper. Special provisions were made as follows:—France shall pay Switzerland all in gold, or in Swiss five-franc

pieces, her gold payment, however, not to exceed 60,000,000 francs (£2,400,000). Italy's maximum payment in gold or Swiss five-franc pieces to Switzerland shall be 20,000,000 francs (£800,000), and her maximum paper obligation 30,000,000 francs (£1,200,000). Switzerland had coined little silver, and thus received the most favourable conditions in the liquidation clause. Between France and Italy it was agreed that the maximum of balance to be settled by either party should be 200,000,000 francs (£8,000,000). In the special agreement, by which Belgium adhered to the treaty, it was provided that she should redeem only one-half of her five-franc pieces held by France, but that in order that France might dispose of the remainder in commerce, Belgium agreed not to alter her monetary system within five years of date of dissolution without being prepared to redeem the other half of her five-franc pieces in gold, and, furthermore, she guaranteed to pay in gold for all over 200,000,000 francs (£8,000,000) of the total balance held by France. The maximum payment by Belgium to Switzerland was fixed at 6,000,000 francs (£240,000), but in case a balance remained, the same agreement, not to change monetary system, held good as towards Switzerland. The banks of France and Belgium again agreed to receive all five-franc pieces during the period of new treaty. The new treaty was made to run for six years, until 1st January 1891, and then from year to year, in the same manner as provided in the treaty of 1880. This treaty is still in force (1896), and the chief question that has come up in the intervening period has had to do with the continual flow of Italian small silver into Switzerland and France, and the consequent dearth of change in Italy, owing to the disarranged financial condition of that country. So great was this dearth of small change in the summer of 1893, that private firms were compelled to issue credit coupons to meet their needs, and in many cases postage stamps were used as money. A conference was called in October 1893 to partially revise the treaty of 1885. The Italian subsidiary coinage question was the sole object of discussion, and an agreement was signed by which the other states are to withdraw from circulation all Italian coins of the denominations of 2, 1, ½, and ⅕ francs within four months after exchange of ratifications, and to receive the same no more in their public treasuries. The coins thus withdrawn are to be held in 500,000 franc (£20,000) lots at the disposition of the Italian government, bearing interest at 2½ per cent from the day that notice has been sent to Italy that the coins are at her disposal. The interest shall be 3½ per cent from tenth day after coins are sent until day of cash payment, and in no case shall this delay exceed three months. One-half of the value of such holdings shall be redeemed in gold pieces, in denominations of 40 francs or over, and the balance in government paper. France was charged with the executive management of details of this operation. The Italian government agreed to redeem a minimum of 45,000,000 (£1,800,000) during the first four months after ratification of agreement, and a minimum of 35,000,000 (£1,400,000) every three months afterwards until the whole sum is redeemed. After Italy has taken back all her small money she ceases to be obliged to receive in her public treasuries the subsidiary coins of other states of the union, according to terms of Act 7 of treaty of 1885, and may take measures to prevent her coins leaving her territory, as may the other states take prohibitory measures against their entrance into their own.

Looking back over the history of the Latin Union, no one will deny that it has played an important rôle in the monetary affairs of Europe, far as this rôle may be from the bright dreams of many of its founders and warmest supporters. It has not only fixed the monetary policy of five great nations, and thus affected the interests of 75,000,000 people, but has also influenced the monetary systems of Roumania, the South American States of Colombia, Ecuador, Venezuela, Peru, and Chili, Spain, Austria-Hungary, and Finland, all of which at one time or other had the same system, or issued coins that would circulate in the union, thus raising the population affected to at least 150,000,000. If external forces have been too strong for the union, and it has in self-defence been compelled to restrict its bimetallic principle, this fact has not been due in any way to an unfriendly attitude towards silver, as the record of its coinage will testify. From 1866 to 1902 the total coinage of gold has been a little over ten billion francs (£422,000,000), and that of silver (⅘ fine) in five-franc pieces, nearly six billion (£233,500,000). It has been said that several of the states of the union would prefer to be free again if it were not for fear of the difficulties of liquidation in case of dissolution. Though occasional proposals for dissolution have been brought up in one or two parliaments, this desire does not in any way meet with general approval in any one of the countries concerned. The advantages of international interchange of money are too great for any country of the union to wish to do away with them. In its most troubled periods the difficult problems that the union has had to meet have always been satisfactorily adjusted, and the most serious of these have had to do with more or less unwarranted suspicion of the future.

Somewhat similar experiments in international monetary unions may be profitably studied by comparing the history of the Austrian-German monetary union founded in 1857 between Austria and the states of the German ZOLLVEREIN, and the Scandinavian union organised in 1875 between Denmark, Norway, and Sweden, and still in force.

LAUDERDALE, Eighth Earl of (1759-1830). James Maitland, afterwards Earl of Lauderdale, entered parliament in 1780. He was appointed, in December 1787, one of the managers of Warren Hastings' impeachment. He succeeded to his Scotch peerage in 1789, and in the following year was elected a representative Scotch peer. As a politician he boxed the political compass. One of the founders of the "Friends of the People," he lived to oppose the Reform Bill of 1832. In private life he is described as violent tempered, shrewd, and eccentric. The same capricious character marked his literary work.

In 1804 he published an *Inquiry into the nature and origin of Public Wealth and into the means and causes of its Increase*, Edinburgh, 8vo (trans. into French by E. Lagentie de Lavaïsse, Paris, 1808), 2nd edition, greatly enlarged, 1819, 8vo, wherein—after an acute criticism of the view that labour affords an unvarying standard of value—a theory of value, as depending upon the interaction of demand and scarcity, and the influence of the distribution of wealth upon the direction which labour takes, is very clearly brought out. In his enforcement of the truth of Bacon's dictum, that money like muck is no good unless it be spread, he supplied considerations to some extent lacking in the *Wealth of Nations* (see Distribution); but the usefulness of the book is marred by captious criticisms of the principle of Division of Labour (*q.v.*), and by eccentric views on finance, which found further expression in *Three letters to the Duke of Wellington . . . wherein the nature and tendency of a Sinking Fund is investigated, and the fallacy of the reasoning by which it has been recommended explained*, London, 1829, 8vo. Saving and spending are the bad and good genii of Lauderdale's economy, and he maintains, with the utmost gravity, that a great extra expenditure is the most fertile means of increasing public wealth, and a sinking fund the most active means of diminishing it. In treating of the sources of wealth Lauderdale claims for capital a place by the side of land and labour. Capital produces a profit, either from its supplanting a portion of labour which would otherwise be performed by the hand of man, or from its performing a portion of labour which is beyond the reach of the personal exertion of man to accomplish. To Lauderdale belongs the credit of having been the first to put forward a connected theory on the nature of profit, in the form of a theory, and not of scattered observations. See Böhm-Bawerk, *Capital and Interest*, Engl. trans., London, 1890, 8vo, bk. ii. ch. iii.—"The indirect productivity theories." Lauderdale's importance in the history of economics lies, not in his conclusions, but in the fact that he was the first in England to consider systematically the fundamental conceptions on which the science is based. In this respect alone he is in advance of Adam Smith. (In this connection, see Bagehot's *Economic Studies*, "Adam Smith and our modern economy.") Among numerous other pamphlets and published speeches, he wrote *The depreciation of the Paper Currency of Great Britain proved*, London, 1812, 8vo, and *Further Considerations on the State of the Currency*, etc., Edinburgh, 1813, 8vo. The Journal of the House of Lords contains eighty-six protests under his signature. He was one of the earliest to allow that capital is in itself productive, and is the result of abstinence.

LAUREL, English Coin. See Guinea, Introduction and Rating of.

LAVELEYE, Émile de (1822-1892), born at Bruges, died at Liège, was a remarkable thinker, and his writings were brilliant in style. Unfortunately for his fame, being not only an economist but also a philologist, an historian, a student of law, a politician, and a moralist, he was scarcely able to fathom the depths of all the subjects he undertook. Absolutely sincere in mind, he allowed himself some inconsistencies of expression which he fully admitted. At one time he frankly acknowledged himself a "socialist of the chair"; but towards the end of his life the disquieting spectacle of the progress of socialism appeared to draw him nearer to those whom earlier he had stigmatised as "orthodox economists."

His principal economic writings are—*Le Marché Monétaire et ses crises depuis cinquante ans*, 8vo, in which he announced himself in favour of the unity and monopoly of banks of issue. *Le socialisme contemporain*, 8vo, 1881; with essay on luxury, etc. (several editions have been published), in which he examined critically the doctrines of Rodbertus, Karl Marx, Ferdinand Lassalle, etc.; and *De la propriété et de ses formes primitives*, 8vo, 1873. He maintained that property was a civil institution, agreeing in this with John Stuart Mill. His last work was *Eléments d'économie politique*, 12mo, 1882, a text-book on the elements of the science. In monetary questions De Laveleye was a partisan of a double standard, and produced many works supporting bimetallism. He contributed to several periodicals of the day, among others to the *Revue trimestrielle*, to the *Libre recherche*, to the *Revue des deux Mondes*, and to this Dictionary the article on Commune. All men of science admired his sincerity, the boldness with

which he championed new ideas, his modesty, and his absolute truthfulness. These qualities gave his works an attractive power which won him many readers. The obituary notice of Emile de Laveleye, written by his pupil and successor in the chair of political economy at Liège, Professor Ernest Mahaim, in the *Economic Journal*, vol. ii., speaks of "the governing idea of his life as being found in the supremacy of justice. He was persuaded that the human race was marching toward an ideal of justice, an image of God, to which ultimately it would attain. He had faith in the boundless progress of mankind, and in the solidarity of all men; and he discerned in the future a society of love, peace, and justice, bringing universal happiness. Emile de Laveleye is a great figure in the century that is passing away."

Professor Mahaim describes de Laveleye as an academic socialist. He believed in the frequent necessity of state intervention to secure the triumph of the common interest over particularist egoism. His criticism, in the *Contemporary Review*, of Mr. Herbert Spencer's *The Man* versus *the State*, disclosed how far he repudiated the "orthodox" *credo*. ". . . He often sent articles to English newspapers, amongst others to the *Times* and *Pall Mall Gazette*. . . . He had a great affection for England; of its language he had perfect mastery; and on its soil he counted many of the most distinguished politicians among his friends." A. C. f.

LAVERGNE, Louis Gabriel Léonce Guilhaud de (1809-1880), was born at Bergerac, and died at Versailles. Rural economy was his special study, and in 1850 he was appointed professor in this subject at the recently-founded *Institut Agronomique*. The suppression of this higher-grade school in 1852 closed his class. It should here be mentioned that at the re-establishment of the *Institut Agronomique* in 1876 he was replaced in the chair of rural economy; but on this occasion illness broke off a course of lectures which were well attended and highly appreciated. Before 1848 he held several administrative positions, and represented the division of Lombez in 1846 as a deputy. The revolution of 1848 brought him some leisure, which he employed in the study of political economy, applying himself to agriculture, the subject in which his interests lay. In 1871 he was elected deputy for the department of La Creuse. In December 1875 he was appointed a life senator. Originally a constitutional monarchist, he courageously and unreservedly joined the republicans as soon as he ceased to believe in the possibility of the restoration of the monarchy. During the closing years of his life he declared himself in favour of the establishment of an import duty on grain. He considered that this duty would have countervailed the taxes imposed in France as compared with the countries whence the corn was imported. He sincerely believed that in doing this he did not derogate from those views on commercial liberty which he had always expressed, and appealed in support of this opinion to the part he had taken in the campaign in favour of free-trade at the end of the reign of Louis Philippe.

In 1854 he produced his first important work, the *Essai sur l'Économie rurale de l'Angleterre, de l'Ecosse, et de l'Irlande*, 18mo. This work, which has reached its fourth edition, won for him admission to the Institute (Academy of Moral and Political Science). He collected, under the title *L'Agriculture et la population*, a series of articles which had appeared (1855-57) in the *Revue des deux Mondes*. The first edition appeared 1857, the second edition 1860-61, 18mo. In 1860 he sent to the press *Économie rurale de la France depuis 1789*, 4to, which has attained three editions. In the same year (1860) he published *Les Voyages d'Arthur Young en France de 1787 à 1789*, 2 vols., and *En Italie et en Espagne en 1787 et 1789*, 18mo. This work also appeared in 8vo, preceded by an introduction. The translations were made by M. H. T. Lesage, one of his old pupils at the *Institut Agronomique*. In 1863 he produced *Les assemblées provinciales sous Louis XVI.*, 8vo, a work which was highly thought of by Guizot. In the following year (1864) he published in the *Revue des deux Mondes* an article entitled, "Le Banque de France et les banques départementales," in which he declared himself in favour of local banks. Finally, in 1870, he published in Guillaumin's collection of contemporary economists and authors, *Les Économistes français du XVIII.e Siècle*, 8vo. The appreciation of all these works has considerably increased since it became known how conscientious the author's investigations were, and how careful he was that every statement he made should be strictly accurate. A. C. f.

[The brilliancy of Lavergne's writings, the clearness of his style, his impartiality, and the correctness of his judgments, have been fully appreciated in the notice in the *Nouveau Dict. d'Écon. Pol.*, ed. Say et Chailley.]

LAVOISIER, Antoîne Laurent (1743-1794), was born at Paris; his occupation as a farmer-general brought him to the revolutionary scaffold in the same city. "The Republic has need neither of *savants* nor of chemists," was the brutal and disreputable reply of Fouquier-Tinville, the public prosecutor, when an effort was made to explain to him the irreparable loss science would suffer through Lavoisier's death.

Endowed with very rare qualities of mind, Lavoisier excelled in all that he attempted. At once a financier, a farmer-general, a deputy, and a highly-placed official, his discoveries as a scientific man have immortalised his name; but the time needed to complete his economic works was not granted him. Thus his work *De la richesse territoriale de la France*, remains unfinished—even a great part of that which once existed has disappeared. That portion of it which research has been able to recover is published in the first volume of *Mélanges d'économie politique* (1847), in the collection of Guillaumin, which also contains a fragment on *Les consommations de la ville de Paris*, and an *Essai d'arithmétique politique*. Count Roederer considered that the celebrated

geometrician Lagrange, the intimate friend of Lavoisier, might have been the author of this.

A. C. f.

LAW. The influence of law on the economic well-being and trade of a country is dealt with under separate headings, of which the most important are enumerated here: *e.g.* Agency, Law of; Allowance System; Angarie, Droit d'; Arbitration; Arrangement, Deed of; Articles of Apprenticeship; Articles of Association; Bankruptcy, Law and Administration; Bequest, Power of; Bill of Exchange, Law of; Canon Law; Civil Law; Code Napoléon; Combination Laws; Commandite, Société en; Companies, English and Scotch Law; Conflict of Laws, Foreign, Domestic; Conspiracy, Common-Law, Doctrine of; Contract, Law of; Copyright; Corn Laws; Courts of Law, England, Ireland, Scotland; Descent of Property; Domicil or Domicile; Entail, Law of; Factor, English Law; Factor, Scots Law; Factor's Acts; Factory Acts; Factory Laws in the United States; Foreign Law in English Courts; Foreign Traders and their Rights, History of; Frauds, the Statute of; Fraudulent Conveyance; Fraudulent Preference; Freehold, Legal; Game Laws; Gilbert's Act; Government, Economic Effects of; Government Regulation of Industry; Grangers and Granger Laws; Hire and Purchase Agreements; Homestead and Exemption Laws of the United States; Illegal Contract; Interest and Usury; International Law; Intestacy; Joint Stock Companies; Labour Statutes; Land, Law relating to; Land Legislation, Irish; Law Merchant; Legislation, Elizabethan; Lex Loci Contractus; Lien; Limitation, Statutes of; Liquor Laws; Local Option; Moratory Law; Mortgage; Negotiable Instruments; Onerous Property; Partnership; Poor Law; Poynings Law; Pre-emption; Primogeniture; Principal and Agent; Property; Restriction on Labour; Roman Law; Settlement (Poor Law); Trades Unions; Truck. The laws of political economy will be found described under their respective subjects.

LAW, JOHN (1671-1729), of Lauriston, was the son of James Law, an Edinburgh goldsmith. Condemned to death for killing Edward Wilson in a duel in London in 1694, the sentence was commuted for imprisonment, but an appeal being brought by one of Wilson's relatives, Law fled to Amsterdam, where he is said to have closely studied the operations of the bank (see BANKS, EARLY EUROPEAN). A pamphlet entitled *Proposals and Reasons for constituting a council of trade for Scotland* (1701) is sometimes attributed to him, but it appears to have been written by William PATERSON (*q.v.*), founder of the Bank of England (Saxe Bannister's *Life and Writings of Paterson*). In 1705 he submitted to the Parliament of Scotland a scheme for the establishment of a national bank, on lines indicated roughly in his pamphlet published the same year, *Money and Trade considered, with a proposal for supplying the nation with money*, Edinburgh, 4to; 2nd edit. London, 1720, 8vo; Glasgow, 1750, 8vo; Somers' *Tracts*, London, 1809, 4to, vol. 13. His scheme, however, was rejected, partly through Paterson's influence. During the next few years he made frequent overtures to various European governments to undertake some of his financial projects. His proposal for a bank in France was submitted to the council on October 24, 1715, but though it received the support of the Duke of Orleans, it was rejected in the form suggested, owing to the influence of the Duc de Noailles. On May 20, 1716, letters-patent were issued to Law and his associates for the establishment of a Banque Générale. The capital of the bank was divided into 1200 shares of 5000 livres each, payable in four instalments, one-fourth part in specie, and three-fourths in state notes. Each shareholder had one vote for every five shares he held, and the bank regulations were to be decided upon by a general meeting of the shareholders. The bank was authorised to issue notes payable at sight and to the bearer, to discount bills, and to receive money on deposit. It was stipulated on Law's notes that they should be payable in coin of the same standard and weight as on the day of issue, a provision of great importance in the fluctuating state of the French currency. On April 10, 1717, Law's notes were ordered to be received in payment of taxes. Law now embarked on his famous scheme of colonisation, known as the Mississippi scheme. His *Compagnie de la Louisiane ou d'Occident* was incorporated in August 1717. It absorbed the company founded by Antoine Crozat in 1712, and also the Compagnie du Canada. The rights conferred upon the company extended over the territory drained by the Mississippi, the Ohio, and the Missouri. The directorate consisted of Law and six others. In August 1718 the company acquired the monopoly of tobacco for a payment of 4,020,000 livres. In December of the same year, the Banque Générale was converted into the Banque Royale, and its notes guaranteed by the king. The change was effected by the government purchase of the 1200 shares of which the capital of the bank had been formed. On these shares only the first fourth had been paid, 375 livres in specie, and 1125 livres in paper whose value was not more than the 400 livres at the current rate. The purchase was made at par and in silver. In 1719 the Compagnie d'Occident absorbed the Compagnie des Indes Orientales and the Compagnie de la Chine, taking the name of the Compagnie des Indes. It absorbed also the Compagnie d'Afrique and the Compagnie du Sénégal. In the same year the company obtained the control of the mint, undertook the payment of the

national debt, and received the farm of the revenues. The bank and the company thus had complete control of the colonial trade of France, its currency, banking, and fiscal system. Speculation in the shares of the company and the bank reached a height unparalleled even in England in connection with the South Sea Bubble. Law introduced reforms, reduced taxation, promoted agriculture, industry, and in some directions encouraged free trade. It was confidently predicted that English trade both in the East and West Indies would be ruined. On 5th January 1720 Law became controller-general of the finances, and on 23rd February 1720 the Compagnie des Indes was united to the Banque Royale. But the reaction had already set in, and once the confidence of the public was disturbed, the downfall of Law's system was speedy and certain. Violent measures were resorted to in order to stop the drain of specie which began as soon as speculators exchanged the paper money for coin. The crisis was precipitated by the decree of 21st May 1720, gradually reducing the value of the bank-note to one-half. Panic followed; the decree was rescinded a week later, but the bank suspended cash payments. Law was soon after obliged to leave France; he died at Venice.

[There is a whole literature of books, etc., relating to Law and his "System." Refer to the histories of Lacretelle, Lemontey, Martin, Michelet, Voltaire, Louis Blanc, etc., and the following works:—Pierre Bonnassieux, *Les Grandes Compagnies de Commerce.*—P. A. Cochut, *The Financier Law: his Scheme and his Times.*—A. Macf. Davis, *An Historical Study of Law's System*, reprinted from the *Quarterly Journal of Economics* for April 1887.—Duhautchamps, *Histoire du Système des Finances pendant les années 1719 et 1720.*—Forbonnais, *Vue générale du Système de M. Law*, in his *Recherches et Considérations sur les Finances en France.*—J. [See Life, *Dict. of Nat. Biog.*; arts. on DUTOT; MELON; SYSTÈME.] W. A. S. H.

LAW MERCHANT means the law applicable to merchants as such and to mercantile transactions. "Mercantile transactions" mean buying in order to resell, and a "merchant" is one who makes a profession of these transactions. Generally speaking, the sphere of law merchant is coextensive with what economists call EXCHANGE; but transactions with regard to land are usually excluded, and in France even land-jobbing is so; and although petty traders are as a rule included, it required in England a judicial decision, and in Leipzig (1682) a struggle, to include them; and the German and Spanish codes still exclude trading artisans. Productive industries ancillary to exchange, though excluded by early writers like STRACCA and SCACCIA, are now always included in its scope, *e.g.* the construction of ships for traffic, and the manufacture of raw materials (French "Code de Commerce," art. 632, 633; German do., 271-275; Italian do., 3; Spanish do., 325): and it extends to important "distributive" questions,—thus, the wage-law of sailors (assigned in England to the Admiralty Division of the High Court), the bankruptcy of traders (of which our judge in bankruptcy—who is sometimes a judge of the Chancery, sometimes of the Queen's Bench Division—takes cognisance), and of companies (over which a special judge, usually the judge in bankruptcy, has jurisdiction), the relationship of partners (between whom our Chancery Division takes accounts), of factors and principals, assurers and assured (who usually come before our Queen's Bench Division), form substantial chapters of English books on Lex Mercatoria, like those of MALYNES (1622) and Beawes (1751), and of every commercial code. If "law merchant" does not fit exactly into any one of the three departments of political economy, neither does it quite conform to any one legal conception. Most law merchant may be regarded as a particular application of the general idea of contract, yet Malynes', Beawes', or Jacob's (1718) "Lex Mercatoria" combine the instruction contained in Tate's *Modern Cambist* or Inglis on *Book-keeping*, with what we should call legal instruction; and the continental codes of commerce and the English Merchant-Shipping Acts still make book-keeping a statutory duty; and further "bills of exchange," which at first blush look like the merest contracts, are overladen with minute arbitrary rules which the most ingenious jurist could not have deduced from the idea of contract. The truth is that "law merchant" was a body of rules laid down by merchants for regulating their conduct one with another. Economical definitions of exchange and juristic definitions of contract are derived from these rules, not *vice versa*. In all the great matters relating to commerce, legislators have copied, not dictated. The copying of merchant rules into the statute book, though literal, has not been without effect. On the one hand, mischievous rules, like those relating to apprenticeship, combination, and monopoly, might have lived for ever had they not as state laws been exposed to the search-lights of a fiercer criticism;

[1] A remarkable collection of prints and pamphlets relating to Mississippi Scheme and Dutch East India Co.

on the other hand, good rules have been expressed in scientific language, and being thus expressed, have spread their influence over other walks of life. "Law merchant" has been by this means one of the chief incentives to progress. Its mode of action has been two-fold; it has either contributed directly to the main stream, or it has run in a bed of its own making.

The first mode of action is the rule in ancient Rome and modern England. Thus the idea of agency was at first represented in Roman law by two actions only, that of "traders" ("institores" or "negotiatores") and of "shipping merchants" ("exercitores"); later in the day these two actions were generalised, and the contract of agency was admitted as valid. And here is an instance of incorporation without generalisation. The "laws of the Visigoths" (xi. iii. 2), which were the western substitute for Justinian's Digest, enacted that transmarine "negotiatores" should carry their own judge with them, a custom followed by mediæval merchants, who were invariably accompanied by some travelling judge called "consule sul mare," "Hansgraf," "Kurt," etc. Some mercantile usages, however, existed side by side of the codes, like dialects by the side of civilised speech, *e.g.* the Rhodian sea-laws, which date back to classic Greece, and the principles of Sociétés en Commandite (see COMMANDITE, SOCIÉTÉ EN), which anticipate the latest company law (Silberschmidt's *Die Commenda*, etc., 1884). But this collateral existence of law merchant is a rare feature in Roman law.

Conversely during the middle ages, as upon the continent to-day, exclusion is the rule, incorporation the exception. "The grandeur and historical significance of the mediæval merchant is that he created his own law out of his own needs and his own views," writes Goldschmidt. This creative task was twofold. He had to create his own courts and his own jurisprudence.

(i) MEDIÆVAL COURTS were territorial, so that the traveller or merchant, the terms were once almost synonymous, had to carry his judge with him, or special courts had to be invented for him—just as there were special courts for ecclesiastics—or else he was beyond the pale of law. Mercantile courts may be divided, according to their constitution, into four kinds.

First, there was the gild type, whose most conspicuous development was witnessed in the Italian town. There, during the late 12th and 13th centuries, the system of having a special judge was borrowed by merchants at home from merchants abroad, and the "consule sul mare" became "consule del mare"; and at the same time the democratic and federalising tendencies of Italian institutions invested his character with a new importance. At that time gild, if "arte" may be so construed, federated with gild and formed some "curia mercatorum" or "curia maris" under the presidency of a consul, usually elected by those whose names were on the gild-register (matricola). Early in the 14th century and onwards, codes of customs, sometimes called "statuta," sometimes "consuetudines," were drawn up within the gild in order to define the functions which its officials exercised. In the early "codes of the merchants" ("brevia mercatorum") these functions are mainly administrative; the judicial element is meagre; but in administering the famous "Consolat del mar" of Barcelona (*circa* 1370), which had grown out of earlier Italian and Spanish codes, and soon became a general maritime code for the western Mediterranean, the "consul of the sea" was administering one of the civilised codes of the world. The Pisan "consul of the sea" was, during the 13th and 14th centuries, the judge who administered the sea-codes of Pisa, which were the most highly developed sea-codes prior to the "consolat," and included matters in any way connected with the sea (Schaube, p. 140). But Pisans who were not members of the sea-gild could, if they chose, demur to his jurisdiction (p. 141). Whatever he was practically he was not at this date theoretically the commercial judge of Pisa. Barcelona rounded off the work which Pisa had just failed to complete. There, the town was a stronger power behind the gild than in Italy, and during the 14th century it had appointed the sea-consul. And behind the town stood the king of Aragon, who gave the sea-consul of Barcelona exclusive and compulsory jurisdiction since 1347 in maritime, and since 1401 in all mercantile matters ("omnes causas civiles provenientes ex quibuscunque actibus mercantilibus ubicunque in terra et in mari," Schaube, p. 254). This was the first court of its kind; and the example of Barcelona was followed in Montpellier (1463) and even Paris (1563), where the "curia maris" and "consul maris" had had an indigenous origin under the respective titles "Métier de l'eau," "Prévôt des marchands de l'eau." The courts of "the aldermen of the merchant" or "the merchant" in the foreign factories of the Hanseatic League, though interesting as an incident in the history of the consulate, played no part in the evolution of the commercial court.

The "fair-courts" of France, which are connected with the Italian institution of federated merchant gilds (see MEDIÆVAL FAIRS), only ripened into permanent commercial courts of some definite district in 1669 (Troyes), and Leipzig (1682) was the first instance of a similar development in Germany. They were general in England under the name PIEPOWDER (*q.v.*) courts; but in the more important centres were, in and after 1353, overshadowed

by the courts of the STAPLE (*q.v.*). These sat for the purpose of administering "law merchant" instead of "common law," and were composed of "the mayor of the staple" (who was annually re-eligible by "the commonalty" of local merchants), at least two "constables" (elected by the "commonalty" of local merchants), and two assessors (elected by "the merchants strangers"); officials of the city where and when they sat had to enforce their orders (27 Edward III. stat. ii. c. 21-24). A few years later (36 Edward III. stat. i. c. 7) their jurisdiction was limited, in the case of English merchants, to "pleas touching merchandise, and surety of merchandise between merchants." The mediæval "fair-courts" of France and Germany had practically the same constitution as the "staple courts"; and the modern French commercial courts are similarly composed of "président," at least two "juges" and "suppléants," all elected by the "commercial notables" (see NOTABLES COMMERÇANTS) of a district; and the decisions of these courts are enforced by the ordinary courts. The courts of the staple vanished with the staple in the 16th and 17th centuries, and at the same date piepowder courts fell into disuse. For two or three centuries they fashioned and administered the unwritten "law merchant" as it was understood in England.

Secondly, there was the municipal type, which flourished most in Germany. Thus Nürnberg became a "free city of the empire," where justice was dispensed by a nominee of the imperial representative ("Schultheiss") jointly with nominees of the town council ("Schöffen"). In 1313 the "Schultheiss" was subordinated to the Schöffen for the purposes of trade-disputes ("statuta de rebus venalibus"). After 1497 other town-law followed in the wake of trade-law, and the "Schultheiss" was nominated by the town council. In 1508 trade-law ("Kaufmannshandel") was again separated from the mass of town-law; appeal to the imperial tribunal being disallowed in trade disputes. Meanwhile, Lübeck and Hamburg, which had had a somewhat similar history, celebrated their freedom by adopting almost identical "water-law" in 1270 and 1299. This town-law was the chief nucleus of the law of the Hanseatic league. What is not an adaptation of Lübeck town-law in "Dat Hogheste Water-Recht" (or as it is miscalled "The Wisbuy Ordinances") is a translation of "The Rolls of Oléron and Judgments of the Sea"; and "Dat Hogheste Water-Recht" was, it is believed, the code of the league until the league's commercial "recesses" (1369 to 1614) superseded, or (far more usually) re-enacted it. These "recesses" are still more essentially town-law; they were issued exclusively by deputies of the towns; they were inspired by Lübeck, the capital city of the league; and the only domestic judiciary referred to in them is "the council of the town," or simply "the town"; and that, although some of these towns contained a "shipowners' company" with "aldermen" (Recess 1591 art. 18 and 19). Yet the first sea courts of first instance are those of Hamburg (1623) and Lübeck (1655), neither of which developed into commercial courts until long after the latter were an accomplished fact in Nürnberg. It was not sea-law nor any court for sea-law which led to the institution of commercial courts in Germany, but "bourse" law and specifically "bank" law. In 1560 Nürnberg erected a bourse ("Herrenmarkt"); and as in London, Frankfurt, and elsewhere, its president ("Markts-Vorsteher") assumed disciplinary power over the brokers and factors connected with it. In 1621 the bank was started, and the "Markts-Vorsteher," together with five merchant deputies, were given exclusive cognisance of banking disputes which in 1624 were identified with mercantile disputes. Things, however, requiring "altiorem indaginem," or the examination of witnesses upon oath, were withheld from this tribunal until 1697, in which year it added to its old title "bank-court," a new title borrowed from the court of the fair at Botzen, namely, "mercantile court." Silberschmidt has conclusively traced the critical changes of 1621, and 1624, and 1697, if not of 1508, to an Italian origin. The mercantile court of Nürnberg was the first of its kind in Germany. In England, as in Nürnberg down to 1560, the town courts, in the absence of piepowder and staple courts, dispensed law merchant from the 12th and 13th centuries and onwards. The towns often represented the merchants politically; thus, when Edward I. wanted a tax on "merchandise" he got together deputies from forty-two towns (Stubbs' *Select Charters*, A.D. 1303). GILD MERCHANT is the most important economic attribute of town life; sometimes as at Preston it is the town (Hegel, i. p. 94). An elected judiciary is one of the commonest privileges of the earliest town charters. The towns are in the first instance called on to administer "law merchant" to foreign merchants under the "carta mercatoria" (Rymer's *Fœdera*, ii. 2, 747), and the Ipswich town-court set apart special days for administering "the law pypowdrous in time of fair and marine," "the law of merchandise and law of the sea" (*Black Book of the Admiralty*, ed. Travers Twiss, ii. p. 21-25). London, perhaps, had a separate court, "the court of the hustings," for mercantile matters (Hegel, i. 60); if so, it soon became a general civil court. No gild court ever exercised any important judicial duties in England (Gross, i. 113); so there was nothing to prevent English town courts from becoming

fountains of law merchant like Lübeck or Nürnberg; and perhaps if Marquardus instead of Lord Coke had been our 17th century jurist, we should learn that this was the case, but we have no proof of it. English town-courts, like the stannary courts for tinners in Cornwall, played a silent part in the growth of "law merchant."

Thirdly, there were central national courts. An appeal lay from the English staple courts to the chancellor (27 Edw. III. st. ii. c. 24), from the French fair courts at Troyes to the "parlement" at Paris. And there were national courts of first instance. The Arragonese code of 1266 ("Siete Partidas") mentions deputy admirals with judicial authority appointed by the king. In England the admiral was in the 14th century instructed by the king and council to appoint deputies "discreet in the ancient customs of the sea," "to exercise exclusive jurisdiction over maritime affairs" (*Black Book*, i. p. 3, 69), and to take the Rolls of Oléron as law. These deputies are the precursors of the modern judges of the admiralty division of the high court, who, however, lost their jurisdiction over maritime contracts before Lord Coke's time (2 Gallison's Reports, 398). The history of the French admiralty ran on similar lines down to 1790; the famous "Ordonnance de la Marine" 1681, which, along with the "Ordonnance de Commerce" of 1673, is the basis of the code of 1807, gave the deputy admiral (since 1554 called "admiralty judge") cognisance of maritime contracts; in 1790 this power was taken from him, and was shortly afterwards vested in the tribunals of commerce.

Fourthly, we find voluntary arbitrative bodies. A commercial college was in 1485 established at Antwerp for this purpose. In England the arbitration of "grave and discreet merchants" blossomed into the short-lived and impotent insurance court of 1601 (see 43 Eliz. c. 12); and stockbrokers and underwriters, before being admitted, agree to submit their mutual differences to their respective committees; agreements of this kind were first made binding in England in the case of "merchants and traders" only, in 1698 (9 & 10 Will. III. c. 15), as in France where at the present day these agreements are only valid if commercial. With these exceptions the control of the English exchange, in the city sense, over its members remains what it was in Frankfurt and Nürnberg at the close of the 16th century. Arbitration is the root of all law; and the peculiarly lay constitution of the Austrian "Wechsel-Gerichte" or bill of exchange courts of 1717, and of the modern French commercial courts, somewhat ostentatiously proclaim this origin for law merchant.

To sum up this section—the commercial courts arose in consequence of some branches of commercial law—sea-law or bourse-law—breaking away from the other branches of civil law. The branch that broke away was at the time growing very quickly; while the other branches were hardly growing at all.

(ii) MEDIÆVAL JURISPRUDENCE included such feudal barbarities as "ordeal of battle" and "compurgation," and took its tone from ecclesiastical prejudices which denounced the taking of interest upon capital, and whose spokesman, St. Chrysostom, wrote, "No Christian ought to trade, or if he did, he ought to be cast out of the Church" (Goldschmidt, p. 139). If then mercantile morality crystallised into laws, it might be expected that these laws would be animated by a very different spirit from that of the prevalent system of law. The characteristics of "law merchant" may be summed up under the following heads:

(*a*) It is non-national. It is part of the instinct of merchants to seek for points of agreement instead of difference with one another. How uncritical this instinct was may be illustrated by the odd details which pass from one code to another. Thus the 53rd chapter of the Consulat prescribes, as a scale for assessing damages, a compromise between that in Roman law and Oléron law. Pardessus regards this compromise as unique (II. 21), yet the very thing recurs in the "Coutumes d'Amsterdam," etc. (art. 33-34). The 54th chapter of the Consulat, in describing jettison, puts a speech into the captain's mouth; this Thucydidean expedient is taken from the corresponding article (8) in the "Rolls of Oléron." Indeed, borrowing was so reckless that none knew whence they borrowed. Frenchmen claimed the "Rolls of Oléron" as French, Flemings as Flemish, Swedes as Swedish, Englishmen as English. The Consulat has been disputed property between Spain, Italy, and the south of France. In the 17th century the process is more deliberate, but is still non-national; thus the opinions ("parere") of the "Markts-Vorsteher" in some German town circulated in other towns in Germany and Italy with an authority which recalls that of the "responsa prudentum." Even national unity which, in the 16th century, severed the wider unity which had prevailed for commercial purposes, has in modern times substituted a wider for a narrower unit; thus it made the code of commerce of 1861 into a German code in reality as well as in name, and it turned the Sardinian code of commerce of 1842 into the first Italian code of 1865. And national supplemented by international agencies have quite recently produced what is almost an international code for preventing collision at sea (Phillimore's *International Law*, vol. iv. ch. 41), and for copyright. The Roman dream of an universal law has never wholly faded away. Indeed,

jurists, forgetting that modern law is a new creation and not a reminiscence, have often overrated the influence of this dream upon the men of the market-place. The above-cited instances have nothing to do with Rome; they are caused by infection not heredity.

(*b*) A common attribute of mercantile jurisprudence is that its procedure is milder against the person and stricter and quicker against the property of the delinquent. The making of contracts by part payment has passed from law merchant into general law (Pollock and Maitland's *History of English Law*, 1895, ii. 207, cp. Pertile, 4, 474). English land was first made liable for debts under "The Statute of Merchants," 1285, "The Statute of the Staple," 1353, and the statutes relating to deceased traders only (1807-33); and English bankruptcy from 1571 to 1861 applied only to persons who "used the trade of merchandise," "sought their living by buying and selling," and the like. Diderot's definition of bankruptcy: "Faillite est lorsque un marchand ou négociant se trouve hors d'état de remplir les engagements qu'il a pris relativement à son commerce ou négoce," still holds true of France, Italy, and every Romance nation. The lien of shipowners and bankers on what is consigned to them *quâ* bankers and shipowners is Roman, but is also rediscovered in the fair courts and sea courts of the middle ages; and other special liens have been admitted into modern law (Code of Comm., Fr., 306-8; Ital., 508; Germ., 409; Span., 665); thus in Germany every trader has a lien against traders in respect of trade transactions (Co. Comm., 313). As for speed, which is generally the excuse for detaching commercial from other actions, in ancient Athens commercial causes (ἐμπορικαὶ δίκαι) had to be despatched in a month, and a month is the average delay in deciding an action entered on the "Commercial Cause List" recently instituted in the Court over which Mr. Justice Channell now presides (1905).

(*c*) The fundamental characteristics of sale, contract, and status differ in mercantile and other civil law. A purchaser of goods in "open market" (see MARKET OVERT), including a London shop, has in England a good title against all the world, and if you add "unless the real owner restore his purchase money to the purchaser" and leave out the word "London," you have French, Italian, and Spanish law (Co. Civ., Fr., 2280; It., 709; Sp., 1955, 464; cp. Co. Comm., Germ., 306-8). This law is mediæval, not Roman, and contradicts the general civil law of modern Europe. A sale or pledge by mercantile agents not authorised to sell or pledge passes a good title to the goods under the English FACTORS' ACTS (1823-77, re-enacted 1889), which only generalise a mediæval and modern maritime law, and COMMERCIAL INSTRUMENTS (*q.v.*) when "negotiable," which means assignable at "law merchant," pass a similarly good title; moreover, contracts embodied in them were assignable long before other contracts. It is a maxim of "law merchant" that a contract binds whether written or not; and this is allowed in most commercial codes (Fr., 17; Germ., 317, 34, etc.; It., 44; Co. Civ., Fr., 1341; It., 1341), and is enforced by extra-legal sanction on the London stock exchange (*Rules of the Stock Exchange*, Stutfield and Cautley, 1893, p. 39): and merchants obtained the concession that the consideration for a guarantee need not be in writing ("Mercantile Law Amendment Act," 1856, § 4), but otherwise in this matter civil have prevailed over commercial principles in England as in the last Spanish code (Co. Comm., 51; Civ., 1280). Passing to special contracts, in France and Spain the guarantee of a bill of exchange, in Germany and Italy every commercial guarantee, and in England every guarantee, enables the creditors to proceed directly against the guarantor; except in these cases, the creditor, as in later Roman law, must first proceed against the principal debtor (Co. Comm., Fr., 142; Germ., 281; It., 40; Sp., 487; Civ., Fr., 2021; Sp., 1137). Everywhere we find common carriers and common innkeepers liable for loss of or damage to goods entrusted to them, unless *vis major*, or intrinsic defect, cause the loss or damage (Smith's *Leading Cases*, 9th ed., 236, Co. Comm., Fr., 97-98-103; It., 400; Sp., 361; Germ., 395; Co. Civ., Fr., 1784; It., 1631; Sp., 1602, as to carriers; contrast, Co. Civ., Fr., 1789; It., 1636; Sp., 1182-83, etc.); or, as in Italy, Spain, and England, accident; an enactment which is Roman as well as mediæval. Where formalities are insisted on by the commercial code but not under the civil law, it is usually because a new entity is created;—thus partnerships and joint-stock companies, if commercial, are registered (Co. Comm., Fr., 42; Germ., 86, 151, 176, 210; It., 90; Sp., 16-17), except in England, where, however, companies, and under the rules of the stock exchange (39) stock exchange partnerships, are registered; or it is because a new status is conferred, *e.g.* on infant traders or married women. The status of married women has been hardly affected by Roman law, but is the result of secular conflicts between mercantile canon and feudal law, of which we see traces in the present law of nations. Before 1882, married women, if trading in "London," had "by custom," *i.e.* law merchant, in the city courts complete capacity, and if trading elsewhere with their husbands' consent, had capacity to contract, sell, and pledge, so far as their trade property was concerned; since 1882 the partition dividing traders from non-traders is broken down. Similarly, married

women trading with their husbands' consent have in Germany and Italy complete capacity, in France and Spain capacity to contract, sell, and pledge, so far as their trade property is concerned; (Commercial Codes, Germ., 7-9; It., 14; Fr., 5; Sp., 6, 10; contrast, Civil Codes, Fr., 217-226; It., 134-5; Sp., 59, 60, 1263); and this law came from mediæval town law or gild law (Pertile, iii. 243; Goldschmidt, p. 221, *n.* 117). Briefly, law merchant dismisses pedantic distinctions of outward form, of the personality of contracting parties, of title and of sex, in order that it may carry ideas of sale and contract to their last conclusions; and discusses the responsibility of married women and "infants" as it discussed that of the stranger on a broad human basis.

This section may be summed up thus: mercantile law was far better and is still somewhat in advance of other civil law. That will explain what is described above as the breaking away of the commercial branch from the other branches of civil law. But an interesting question arises—which was the trunk? On the one hand the arrangement of the French codes and the language of English judges assume that the civil law is primary and the commercial code is secondary; that the latter is an offshoot and variation of the former. If history had begun with Justinian's codes, this view would be right; but Justinian's codes were the last result of centuries of competition between civil and prætorian law, the latter being in the main law merchant; and besides history to a large extent started its course again in the middle ages. On the other hand, the new Italian, the new Spanish, the new Portuguese (1888), and the German commercial codes, erect "law merchant" into a self-centred body of law, like criminal law; and mediæval history is on the side of this view; law merchant was built up in courts of its own; these courts were invented at a time when mercantile law had little or nothing to learn from other contemporary civil law, and the latter had everything to learn from the former. Perhaps the question is incapable of solution, as we should first have to determine the origin of our ideas of contract and civil responsibility; it will be enough for our purpose to state that these ideas first attained clear expression in connection with mercantile transactions; and in modern Europe long after mercantile transactions had been relegated to autonomous mercantile courts.

LAWS OF POLITICAL ECONOMY—EXAMPLES.

Law of Constant Return, p. 582; Costs, p. 582; Demand, p. 582; Derived Demand, p. 582; Diminishing Returns, p. 583; Diminishing Utility, p. 583; Increasing Returns, p. 583; Indifference, p. 583; Satiable Wants, p. 583; Subordination of Wants, p. 583; Substitution, p. 584; Supply, p. 584.

Law of Constant Return.—In general, the increase of the scale on which an industry is carried on is accompanied by a change in the proportionate cost of its product; but when the increased difficulties of extractive industry (see Diminishing Returns) are set off against the economies arising from improved organisation in manufacture (see Increasing Returns) we may find an exact balance struck, and an increased produce obtained by labour and sacrifice increased just in proportion. In such a case, the law of *constant returns* is said to hold.

Law of Costs.—This is one of the names under which the well-known statement, that exchange value tends to an equality with cost of production, is referred to (see Cost of Production).

Law of Demand.—This law is practically as follows. In every case, the more of a thing is offered for sale in a market the lower is the price at which it will find purchasers, or, in other words, the demand price for each unit diminishes with every increase in the amount offered (see article Demand). (Marshall, *Principles of Economics*.)

Law of Derived Demand.—When a commodity is such that there exists no independent demand for it, the demand for the goods, in the production of which it is associated with a number of others, serves to determine a law of derived demand for the commodity in question. The aggregate of the prices at which the appropriate supplies of the other things, which are associated with it in the production of the goods, will be forthcoming, being subtracted from the price at which the corresponding quantity of those goods can find purchasers, the remainder is the limit of the demand price for a given amount of the said commodity.

LAW OF DIMINISHING RETURNS.—If one, or more, of the industrial agents, the co-operation of which is necessary for the production of any commodity, be increased, the others remaining unaltered, the amount of the product will generally be increased. If the increase of product be in a less proportion than the increase of the industrial agents considered, we express the fact by saying that in this case the product obeys the law of diminishing returns.

The usual definitions found in economic treatises combine a statement of the law with the assertion of its applicability to the case when increased capital and labour are expended on the same land. As the law is of far wider application, its statement, free from the reference to the particular case of land, seems to the writer to be desirable.

[For the limitations connected with the use of the law in the case of land, see DIMINISHING RETURNS.]

LAW OF DIMINISHING UTILITY.—The facts of human nature on which the law of demand is based are expressed in the law of diminishing utility. Professor Marshall states it thus:—"The *Total Utility* (that is, the total pleasure-affording power) of a commodity to a person increases with every increment of his stock of it, but does not increase so fast as his stock increases. If his stock of it increases at a uniform rate, the pleasure derived from it increases at a diminishing rate." A few lines later this is abbreviated, and at the same time expressed more precisely as follows:—"The marginal utility of a commodity to any one diminishes with every increase in the amount of it he already has."

Some of the few exceptions to the law as stated in this form, and mentioned in Professor Marshall's footnote, are excluded by the wording adopted by Jevons, viz.:—

"The degree of utility varies with the quantity of commodity, and ultimately decreases as that quantity increases."

The expressions "degree of utility" and "marginal utility" are used to signify the same thing, and these latter statements make it clear beyond any possible doubt that it is not the *total* utility but the *marginal* utility which diminishes. (For a full explanation of these phrases, see DEGREE OF UTILITY.)

LAW OF INCREASING RETURNS.—When, under the circumstances supposed above (see "Law of Diminishing Returns"), the increase of product is in greater proportion than the increase of the industrial agents concerned, the *Law of Increasing Returns* is said to be in operation.

The improved organisation of manufacturing industries which is possible when the scale of production is enlarged, causes the law to be applicable to them in general. Further, if the increase of numbers among a people be not accompanied by conditions leading to a decrease of the average of individual strength and energy, their collective efficiency will increase in greater proportion than their numbers, that is, the law of increasing returns will apply to the national industry at large (see also INCREASING RETURNS).

LAW OF INDIFFERENCE.—This is the name applied to the law that "In the same open market, at any one moment, there cannot be two prices for the same kind of article." This is a particular case of the law of substitution (see below), and the case of which the truth is most obvious, since the substituted commodity is similar in every respect to that which it replaces. It must be added that the hypothesis in dependence on which this law is formulated is that the dealers in the market considered are in possession of sufficient knowledge of what is taking place, and are sufficiently active in pursuit of their own interest, to lead them to refuse to pay to any person more than would be demanded at the same time and in the same place, by any other for articles precisely similar to those purchased (see INDIFFERENCE, LAW OF).

LAW OF SATIABLE WANTS.—This title is used by Professor Marshall as an alternative to that of the law of diminishing utility. The form of statement of this latter law, which Jevons quotes from Richard Jennings (see Jevons, *Theory*, p. 56), throws that feature of it into prominence which leads to the use of the title now under consideration. It is as follows:—"With respect to all commodities, our feelings show that the degrees of satisfaction do not proceed *pari passu* with the quantities consumed; they do not advance equally with each instalment of the commodity offered to the senses and then suddenly stop; but diminish gradually until they ultimately disappear, and further instalments can produce no further satisfaction." We need not proceed further with the quotation, which would merely yield us another expression of the law of diminishing utility at length. The concluding phrase of the passage quoted embodies the idea of "satiable wants."

LAW OF THE SUBORDINATION OF WANTS.—The same fact is expressed somewhat differently and, in some respects, more in accordance with actual experience, by Banfield, thus:—"The satisfaction of every lower want . . . creates a desire of a higher character." In commenting on this Jevons corrects and explains it as meaning "permits the higher want to manifest itself."

It would, perhaps, be more correct to say that the lower wants are not *absolutely* satisfied, but that, when their satisfaction has proceeded to a certain point, the desire to satisfy higher wants is more urgent than the desire to afford increased satisfaction to the lower wants. While

noting, however, that frequently the power of affording satisfaction by increasing the consumption of a given commodity is not exhausted when such increase ceases, and consumption of an entirely different nature substituted, it is not asserted that instances do not occur, and that frequently, in which, to use the words of Jennings, "further instalments can produce no further satisfaction." The statement of Banfield may be expressed differently, as, for instance, by Senior, who writes:—"It is obvious that our desires do not aim so much at quantity as at diversity." This is referred to by Jevons as Senior's so-called "law of variety." The further explanations which Senior gives are just the expression of the law of diminishing utility already seen to be practically identical with the law under consideration.

LAW OF SUBSTITUTION.—When there is more than one method of producing a given result, the least costly method available will be selected. If there be more than one of which the cost, taking all the circumstances into account, is the same, it will be a matter of indifference which is employed of these equally costly methods, but any less costly method which can be substituted will tend to displace the others.

The practical carrying out of such substitution as is referred to will depend, clearly, not only on its feasibility, but also on the knowledge of business men that such substitution is possible and would decrease the cost of production. A limitation of this nature might be expressed in the enunciation of the law if desired.

LAW OF SUPPLY.—The law of costs is practically identical with that now under consideration. For the limitations and explanations necessary, see SUPPLY. A. W. F.

For Law of Distribution, see DISTRIBUTION, LAW OF; Law of Population, see MALTHUS, REV. T. R.; POPULATION; Law of Wages (Iron), see LASSALLE; MARX, KARL; WAGES. See also Article on DEMAND; DIMINISHING RETURNS; INCREASING RETURNS.

LAWS OF POLITICAL ECONOMY, GENERAL PRINCIPLES. The observation of natural phenomena reveals many instances where two sets of facts are seen to accompany one another or of which the one is observed to follow the other in invariable connection. When such coincidences have been noted, they are frequently placed on record in a statement of the form: "The events A and B will always be found to occur together." A statement of this kind expresses in a general form the result of such experience as has fallen to the lot of the propounder of this "law" or "rule." A wider and more prolonged experience may show that the apparent connection is, after all, no more than a coincidence, or series of coincidences, and that there is no invariable link binding the observed events inseparably together; while, on the other hand, the closer observation of each event, which is naturally aroused by the apparent connection, may show that the generalisation rests on sound foundations, and that human experience presents no instance where the "rule" does not hold.

Sometimes the statement goes further and takes the form "The event A always produces, as its result, the event B." This is more than a mere statement of a definite sequence in time of the events, and implies a causal connection between them. Equally with the form of statement previously mentioned, the test of experience alone can suffice to establish confidence in the truth of such a rule as this. In some branches of science, the process of testing the truth of the hypothetical "law" suggested by the study and comparison of recorded facts, can be pursued by means of experiments all the details of which are under the control of the experimenter. If the statement be found, not only to agree with all recorded experience in the past, but to agree also with the experience obtained by conducting experiments and making observations directed to the special end of testing the truth of this particular allegation, confidence in its truth becomes firmly established, and what was alleged previously in a hesitating and tentative manner as a probable statement of general application may be referred to as a fully determined "law." The term is properly used in precisely the same sense in economic science as in physical science, and a "law" of political economy must be regarded in somewhat the same light as, for instance, Kepler's laws of planetary motion. It is a generalisation from past experience which is found to agree with all that is known, and to satisfy all tests, up to the present, which can be applied to determine its validity.

In every science, what may be called derivative laws are obtained, by combining the results of the rules which direct observation has established. These may be enunciated in the form of extremely simple "principles," the truth of which is established by the consideration that, only if these principles be accepted can observed results be accounted for; or they may be of a complex nature, obtained by the process of uniting the effects of many causes and thus obtaining the complex effect of a complex cause.

Some frequently quoted laws of political economy are of this nature, and much misunderstanding has resulted from an almost universal habit of omitting, in the enumeration of the causes supposed to be in action, some which are of extreme importance, but the absence of which is so unlikely that it is not contemplated or even recognised as possible. This causes little confusion with minds trained in this class of investigation, but is the source of serious error and of much distrust of economic theory in the popular mind. Too often, even

those who might be expected to have in mind the limitations in view of which a given effect may be expected to follow a given cause, have wholly overlooked such of these limitations as were considered to be so obvious as not to need explicit enumeration, and have consequently been led to results inconsistent equally with the rigid application of theoretical knowledge and with facts then or subsequently observed.

In economics the process of inductive demonstration of a general principle is often peculiarly difficult. The conduct of experiments specially devised to avoid the complications arising from the interaction of many causes is difficult if not impossible. The most that can be done is to obtain as many different combinations of causes as possible, so as to trace the common element in the varying combination of results with as much precision as can be attained. Similarly, when it is sought to apply our knowledge to predict the result of any proposed arrangements, the modifying effect of surrounding circumstances must not be left out of account, for, though each cause produces its own effect, the composite result may be quite other than is indicated, while attention is confined to a single cause with its appropriate effect.

It will be seen, therefore, that economic laws are not in any sense absolute statements. They relate to assumed conditions of society, and do not profess to do more than give certain clues to the probable result of any set of causes when those conditions are entirely changed. The reason of this is that though the laws which are known may be quite sufficient to unravel the complications of the changed conditions so far as the *kind* of result is concerned, the lack of precision as to *quantitative* relations between causes and effects which characterises most economic laws often renders it impossible to predict in detail the outcome of untried combinations. Within wide limits, however, the laws which are generalisations from past and present experience may render invaluable help in the prediction of the result of any hypothetical set of conditions in the future. Too much care cannot be taken to remember that we often state the laws without anything like a complete enumeration of the conditions in connection with which we always contemplate their operation. Further, to quote the words of Professor Marshall, "The laws of economics are statements of tendencies expressed in the indicative mood, and not ethical precepts in the imperative."—*Principles*, Pref. to 1st ed.

In addition to the laws which refer to human societies and to the influence of the human mind on the relations between things and persons, there are some statements of the result of observation of physical nature which are also frequently made use of in economic investigations, and are also generally regarded as laws of political economy. In the definitions which follow, an example of this class is found in the law of decreasing returns.

In conclusion, we may say that, being convinced by observation, though perhaps not wholly by observation, that the events of the industrial world manifest order in their mutual relations, we seek to determine, as far as possible, what is the nature of that order. The results, expressed in words, constitute the "laws" to which we have been referring.

LAWFUL HOURS. The state in some cases prescribes the time within which a trade may be carried on, or the number of hours per day, or per week, a class of persons may be employed. By the Licensing Acts, 1872-74, intoxicating liquors are only permitted to be sold during certain hours of the day. By the Factory and Workshop Act, 1878, the period of employment of young persons and women, in textile and non-textile factories, is to be between 6 A.M. and 6 P.M., or between 7 A.M. and 7 P.M.; but in the trades specified in Schedule III. pt. i., the period may be between 8 A.M. and 9 P.M. On Saturdays when work commences at 6 A.M., if not less than one hour is given for meals, manufacturing processes must cease, in textile factories, at 1 P.M., and all other work at 1.30 P.M., in non-textile factories all work must cease at 2 P.M. (see FACTORY ACTS). The act also contains special provisions relating to children, and to holidays. Under the Coal Mines Regulation Act boys between twelve and sixteen cannot be employed under ground for more than fifty-four hours per week, nor more than ten hours in any one day. Restrictions have also been imposed on the hours of boys, girls, and women working above ground. Premises licensed for the sale of intoxicating liquors in London, are to be closed on Saturdays from midnight until 1 o'clock on Sunday, and from 11 o'clock until 5 on Monday morning, and on other days from 12.30 midnight until 5 A.M. In towns outside London they are to be closed from 11 P.M. on Saturday until 12.30 P.M. on Sunday, on Sunday afternoons, and from 10 P.M. on Sunday until 6 A.M. on Monday; on other days they are to be closed from 11 P.M. until 6 A.M. the

following morning. In the country they are to be closed from 10 P.M. on Saturday until 12.30 P.M. on Sunday, and from 10 P.M. on Sunday until 6 A.M. on Monday; on other days they are to be closed from 10 P.M. until 6 A.M. the following morning. By the Factory and Workshop Act, 1895, restrictions are placed on the employment of young persons and women over time, and the employment of young persons at night, and the hours of work in laundries.

[Redgrave's *Factory and Workshop Acts*, 1878-1891, London, 1893.—Von Plener's *Factory Legislation*, London, 1873.—Pease's *Coal Mines Regulation Act*, London, 1888.—Paterson's *Licensing Acts*, London, 1892.] J. E. C. M.

LAWSON, JAMES ANTHONY (1817-1887). From 1840-1845 Whately professor of political economy at Trinity College, Dublin; was appointed solicitor-general in 1861; and in 1865 attorney-general for Ireland. He represented Portarlington in parliament 1865-1868, when he was made fourth justice of common pleas; in 1882 he was transferred to the Queen's bench.

During his occupation of the professorial chair at Trinity, Lawson delivered *Lectures on Political Economy* (London, Dublin, printed 1844, 8vo) in which he defined the subject as that "science which treats of the nature, and production of value, and the laws which regulate the distribution of wealth among the different orders of the community."

After vindicating the science from the charge of inattention to facts, he pointed out (lecture ii.) that a high state of civilisation implied inter-dependence, whether of states or individuals. In his third lecture he maintained Archbishop Whately's position against the Malthusians, and disputed the theory that population increases in geometrical progression as against the arithmetical ratio of the food supply.

He then went on to expose the fallacies of the mercantile system (lecture iv.), and (v.) the error of classing "consumption" as productive or unproductive. In an appendix to this series he attacked Colonel Torrens's defence of the expediency of "retaliation."

In 1855 Lawson addressed the Dublin Young Men's Christian Association on the *Duties and Obligations involved in Mercantile Relations*, advocating the economic necessity and expediency of commercial probity, and deprecating the criminality of speculation and improvidence.

[*Dictionary of National Biography.*] A. L.

Lawson was the first secretary, and was afterwards (1858 and 1870-72) president of the Dublin Statistical Society. He contributed to its transactions, besides a presidential address, papers on the connection between statistics and political economy, on the comparative advantages of direct and indirect taxation, on the over-population fallacy, on commercial panics, and on the patent laws. He was also (1849 and 1851) Barrington lecturer on political economy to the same society.

LAY DAYS. The contract entered into by a shipowner and the hirer of a ship usually contains a stipulation that the goods will be taken out of the ship within a certain number of days after her arrival. These days are called lay days. After the time has expired, the hirer, or party liable, is as a rule bound by the contract to pay a certain sum for every additional day taken for unloading (see DEMURRAGE).

J. E. C. M.

LEAKE, STEPHEN MARTIN (1702-1773), Garter King at Arms, writer on English coins. His father was Captain Martin, adopted by Admiral Sir John Leake as his heir, Leake having married Martin's wife's sister. Stephen Martin Leake held many public posts, and was Fellow of the Society of Antiquaries when about five-and-twenty. He had a life-long connection with the College of Arms, and wrote several essays (unpublished) on matters of heraldry. His chief work is *Nummi Britannici Historia; or, an Historical Account of English Money, from the Conquest to the Uniting of the Two Kingdoms by King James I., and of Great Britain to the Present Time.* The first edition was published in 1726, 8vo, pp. 144. The second edition, considerably enlarged and virtually rewritten, appeared in 1745 (8vo, pp. 428), and was reissued by the publishers in 1793: all published in London. Leake designed this work "for the use and benefit of the curious collector." It is a kind of chronological descriptive handbook to English coins, the first of its kind, taking the coinage reign by reign, with full descriptions, and with a few illustrative plates. M'Culloch, *Lit. Pol. Econ.*, p. 162, speaks of it as "this valuable treatise." Ruding, *Annals of the Coinage*, 1840, pp. viii., ix., considers that "as far as it goes it has great merit, but the plan is too much contracted . . . and is founded chiefly on the authority of printed books, instead of original records."

[Noble, *A History of the College of Arms and the Lives of all the Kings, Heralds, and Pursuivants*, etc., 1804, pp. 408-414, also on pp. 380, 383, 385, 394.—*Dictionary of National Biography*, art. "Leake, S. M."] E. D.

LEASE. A document under seal under which the use of any land or buildings is granted for a definite number of years, or for a period measured by the duration of any life or lives being in existence at the time when the lease is made. The person who grants the use of the land is called the lessor, the person to whom it is granted the lessee. A lease generally contains a number of covenants respectively to be performed by the lessor and by the lessee. The lessor's principal covenant is the covenant "for quiet enjoyment." The lessee's covenants, with the exception of the covenant to pay rent, vary according to the nature of the lease. In a building lease they generally include a covenant to build a house of a certain value and

nature on the demised land; and in most leases of houses the lessee undertakes to keep the premises in good repair. An agricultural lessee, as a general rule, enters into covenants as to the system of cultivation and the nature of the crops, and also as to keeping up flocks and preserving trees; and the lessee of mines promises to work them effectually. Leases mostly contain a proviso for re-entry in case of non-observance of any of the covenants, but the law, to a certain extent, protects lessees against an unfair use of this right (see ENTRY, RIGHT OF). Protection is now also given to agricultural lessees in respect of fixtures and unexhausted improvements (see AGRICULTURAL HOLDINGS ACTS; and as to agricultural leases in Ireland see LAND LEGISLATION, IRISH).

A lease is a very good illustration of the fact that the same legal form may be used for a number of transactions which, viewed in their economical aspect, have hardly anything in common. In the case of an ordinary building lease the lessee is for all practical purposes the owner of the property, and during the currency of the lease reaps the benefit of all improvements and increases in value; whilst in the case of a short-dated lease at rack-rent all changes in the value of the property affect the lessor to a much greater extent than the lessee.

In the case of a building lease the owner, on the expiration of the lease, enters into possession of his land and of a valuable addition to it; in the case of ordinary leases at rack-rents the property remains, as much as possible, in the same state; but in the case of a mining lease the subject-matter of the lease, viz. the minerals, is entirely taken away by the lessee. In the first-named case the principal advantage derived by the landlord is the addition to his property; in the second case his entire gain consists in the rent; in the third case there is generally a fixed rent, and in addition a royalty proportionate to the output. All these circumstances ought to be considered in schemes of taxation affecting the relations of landlords and tenants.

[As to the law relating to leases see Foa, *Relationship of Landlord and Tenant*, 3rd. ed. 1901.—Woodfall, *Law of Landlord and Tenant*, 17th ed. 1902.] E. S.

LEASEHOLD PROPERTY. Property held under a LEASE (*q.v.*). If the lease is for a term of years, however long, the lessee's interest is in the nature of personal as opposed to real property (see CHATTEL). Leaseholds let for a term of years of at least three hundred years, of which at least two hundred years are unexpired, not being subject to any rent having a money value, and not liable to be determined for condition broken, may now be converted into freeholds by the lessee without the concurrence of the lessor's successor in title.

[Conveyancing Act 1881, § 65; Conveyancing Act 1882, § 11.] E. S.

LEAST SQUARES, METHOD OF, is a rule for obtaining the best average result from a given set of observations. Suppose, for instance, that it is sought to ascertain the quantity of coin circulating in a country; and that by different modes of procedure, each purporting to be equally valid, there have been obtained several values for the sought quantity, say x_1, x_2, x_3, . . . x_n; the best result is in general obtained by determining x so that the sum of squares $(x-x_1)^2+(x-x_2)^2+ \ldots +(x-x_n)^2$ should be a *minimum*. This value of x proves to be $(x_1+x_2+ \ldots +x_n)\div n$, the arithmetic mean (see AVERAGE); so that in this case the method of least squares coincides with ordinary practice. It has a more distinctive character in cases where the data are more complicated. Suppose that each *datum* purported to be, not the value of the circulation, but of some quantity depending on the circulation and one or more *other* unknown quantities; as in the case of the statistics relating to the rupee circulation which Mr. F. C. Harrison has discussed in the *Economic Journal* (Dec. 1891). As argued by the present writer (*ibid.* March 1892), if we regard the circulation as possibly increasing during the years under observation, we should have *twelve* equations for two unknown quantities, viz. the-circulation-of-1890 and the yearly-rate-of-increase. Put x for the logarithm of the first quantity and y for that of the second; then from observations relating to successive years we obtain twelve equations of the form $x-ny-a=o$; where n specifies the year under observation and a is a numerical datum. Call the left-hand members of these equations respectively X_1, X_2, etc., X_{12}. The best value of x (and y) is obtained by determining x and y so that the sum of squares $X_1^2+X_2^2+$ etc. $+X^2_{12}$ should be a *minimum*.

In the examples above given the average sought has been an objective thing, not, as more commonly in statistics relating to social phenomena, a *type* (see AVERAGE). But there is no reason why the method of least squares should not be employed to determine averages of the latter class. However, the data from which types are elicited are seldom of the complicated sort above instanced. Accordingly the rôle of the method of least squares in the social sciences appears to be inconsiderable.

A voluminous catalogue of writings relating to the method of least squares has been compiled by Mr. Mansfield Merriman. His own text-book on the subject is remarkably clear and simple. It should be remarked that he appears to take for granted the prevalence of the Law of Error. Whereas it has been held by some mathematicians that the method of least squares is applicable even where that law does not prevail (see ERROR, LAW OF). F. Y. E.

LEBER, C. (1780-1859), was a head clerk in the French ministry of the interior.

He published the *Collection des meilleurs Dissertations, notices, et Traités Particuliers relatifs*

à l'Histoire de France (Paris, 1838, 20 vols.), and an *Essai sur l'Appréciation de la fortune privée au Moyen Age* (2nd ed., 1847), which first appeared in the 1st volume of the *Mémoires des Savants Étrangers*, printed by authority of the French Academy of Inscriptions. This "essay" was long considered as an authority on the subject of prices in France during the middle ages, and comprises sundry tables of prices, official salaries, etc., with the corresponding modern figures. The latter may be usefully compared with similar tables published by M. d'Avenel in the *Revue des Deux Mondes*, 15th June 1892, pp. 795 and 803, and in the latter's great work, *Histoire Économique de la Propriété, des Salaires*, etc., 1894. E. Ca.

LEBLANC, François (died 1698), a French numismatist, born in Dauphiny. Being a man of fortune, he took up the study of coins and medals, and formed a fine collection. In 1688 he travelled in Italy, and on his return published his *Traité historique des Monnoyes de France depuis le commencement de la Monarchie jusqu'à present*, Paris, 1690. This volume treats only of the regal coins, and contains numerous plates. A second, twice as long, which describes the seigneurial coinage, has never been printed. From the reign of Philippe le Bel the printed work is founded on the registers of the *Cour des Monnaies*, and contains elaborate tables giving the value of the mark of gold and of silver year by year, together with the value and degree of fineness of the *gros*, *blancs*, *testons*, and other coins, with the same chronological exactitude. In 1689 the author had published, at Paris, his *Dissertation sur quelques monnoyes de Charlemagne, Louis le Débonnaire, Lothaire et ses successeurs, frappées dans Rome*. This was reprinted with the larger work in the Amsterdam edition of 1692. R. H.

[Cantillon, *Essai* (Boston reprint 1892), p. 137 refers to Leblanc, *Traité des monnoyes*, Paris, 1692 (1711, 1714, 1723). This work is described by H. Higgs, Harvard *Journal of Economics*, vol. vi., p. 437, as "a practical little book on the working of a mint."]

LECLAIRE, Edmé-Jean (1801-1872), the founder of French Profit-Sharing, was the son of a village shoemaker. On leaving school he knew, at most, how to read and write, and never mastered the mysteries of spelling. At seventeen he migrated to Paris, and was apprenticed to a house-painter. Nine years later he set up in business by himself, and from the first prospered greatly. The idea of profit-sharing was first suggested to him by a M. Frégier in 1835, who, however, afterwards refused to believe in its feasibility. It was not till 1842 that Leclaire felt himself able to put the idea into practice. He informed his workmen of his intention of dividing among a certain number of them, afterwards termed the *noyau*, kernel, or *élite*, 50 per cent of the annual profits after deducting 5 per cent for interest on capital, and £240 for salary of management. At first the men looked on the proposal with suspicion, but when, as the result of the first year's working, he threw on the table a bag of gold, and proceeded to divide among forty participants sums amounting to over £11 each, the object lesson proved convincing. The sums received varied according to the amount of the yearly wage. In the following years, both the amount distributed and the number of participants steadily increased. In 1838 he had established a mutual aid society, which was reconstituted in 1853, and henceforth maintained altogether out of the annual profits, instead of by the members' own contributions. In 1864, though not without some opposition, retiring pensions were substituted for the right to future division of the funds of the mutual aid society, and it was made a perpetual sleeping partner, *commanditaire*, in the firm of "Leclaire & Cie." In the following year Leclaire retired from active management over the business, to Herblay, near Paris, where he endeavoured, with little success, to interest the country people in profit-sharing. In 1869 a formal deed was drawn up, setting out the manner in which profits were to be divided between the managing partners, the regular staff, and the mutual aid society. Two years after, Leclaire, taking to heart the taunt of a socialist workman, "Your house is nothing but a box of little masters who 'exploit' the others," threw open the benefits of participation to all workmen employed. In 1872, on the day following the distribution of £2000 among 600 men, as the annual bonus, Leclaire died, but the work of his life still lives in the firm that bears his name, and in the seventy firms which practise the system in Paris alone. He had himself always advocated profit-sharing on business lines. He left behind him a fortune of £48,000, and always maintained that had he followed the beaten track he could not have succeeded as well, even by sharp practices. Though his motives were in reality lofty, he carefully refrained from putting them forward. In the presence of death, he wrote that he was "the humble disciple of Him who has told us to do unto others as we would wish them to do unto us"; but such had not been his usual note. According to the present constitution of the firm, the capital is £32,000, £16,000 being provided by the mutual-aid society, and £16,000 by the managing directors, in unequal shares. To enable men without capital to be partners, it is provided that the out-going partner may not withdraw his capital until it has been replaced out of the sums accruing to his successor as share in profits. In fact, one of the present partners has risen from the ranks. In the case of the death or resignation of one of them, his successor is elected by the "noyau," who are themselves admitted by the "comité de conciliation," consisting of the partners, and eight other members, five workmen, and three

clerks, or foremen. Of the net profits, 25 per cent go to the managing partners, 25 per cent to the mutual aid society, and 50 per cent are distributed among the employees in cash. This 50 per cent is divided by the whole amount of wages and salaries paid during the year, to obtain the ratio of bonus to wages. Each man's earnings are then multiplied by this percentage to find the sum due to him. The ratio of bonus to wages averaged during a series of years over 20 per cent. Wages have always been paid at the highest rate current in the trade. In 1892 there were 936 participants. The mutual aid society has a capital of more than £110,840. It had, in 1893, 230 members. It provides, besides ordinary benefits, a pension of £60 to those over fifty who have worked for the firm twenty years, half of which is continued to the widow for life; and a lump sum of £40, payable to the family at the man's death. In addition, all employees, whether members of the society or not, can claim, if disabled while in the firm's employ, a full retiring pension, and in any case are entitled after reaching the age of fifty to one of £40, with £20 for widow.

LEET COURT. Without entering upon the difficult questions of the origin and development of the leet, of its relation to the sheriff's tourn and view of frankpledge on the one side, and to the court baron on the other, it must suffice here to describe it in its economic aspect. It enforced, and in part originated, numerous economic and social regulations which are now either considered unnecessary or committed to specialised local and central bodies. Besides some criminal offences which were presentable at the leet, but punishable at the next gaol delivery, the charge to the jury included various smaller crimes, such as the use of false weights and measures and breach of the peace; some police work, such as view of frankpledge; some manorial matters, such as the breaking of boundaries and hedges, the pursuit of villeins, the treatment of stray beasts; some unneighbourly acts, such as eavesdropping; and a great many regulations on social and economic subjects. Of these some were sanitary: waters were not to be corrupted, nuisances of various kinds were forbidden, diseased cattle were to be removed from commons, stale fish and meat were not to be sold. Others were directed towards the repair of highways, the practice of archery, the preservation of fish and game; and a considerable number of restrictions were placed on economic liberty, some of which would now be regarded as intolerable. For instance, apparel was to be minutely suited to the rank of the wearer, and the quality of French and Gascon wines to the rank of the consumer; the ASSIZE OF BREAD AND BEER was enforced, prices of victuals were fixed, and middlemen were expected not to make more than 5 per cent profit on their sales; trees were to be felled, and tanning was to be carried on, according to fixed rules; millers must not take excessive toll, one grain in twenty or in twenty-four being considered enough; forestalling was forbidden; certain trades were not to be united; and labourers were not to "conspire" to obtain shorter hours or increased pay.

These courts, which existed, though at first often without the name of leet, on very many manors, ranked as royal courts of record. They can still be traced in some places, but since the 16th century the growth of the commission of the peace has nearly destroyed them.

[For historical position of the leet, see Maitland's *Select Pleas in Manorial Courts*, Introd., with note A on meaning of the word.—For business of the court, see Kitchin's *Jurisdictions*, 1651.—Scriven's *Copyholds*.—Harland's *Manchester Court Leet Records* (Chetham Soc.).—Wilkinson's *The Manner and Forme how to keep a Court Leete*, 1620. —See also Stubbs, *Const. Hist.*—Garnier, *English Landed Interest*, pp. 364-379.—Pollock and Maitland, *History of England*.] E. G. P.

LEFÈVRE DE BEAUVRAY, PIERRE (1724-1790), was an advocate in the parliament of Paris.

He published in 1769 and 1770 (Paris and Amsterdam) his *Dictionnaire social et patriotique ou Précis raisonné des connaissances relatives à l'économie morale civile, et politique*, reprinted in 1774 under the title of *Dictionnaire de recherches historiques et philosophiques*. E. CA.

LEGACY. A legacy is a gift made by will of money or movable things. A legacy implies that the gift is made by a will; it is primarily payable out of personalty, but may be charged on the real estate. Where a testator desires to make his real estate liable for a legacy, he charges its payment on such estate. A legatee can claim his legacy only after the payment of the testator's debts, as the law prefers the claim of a creditor to that of a legatee. If after payment of debts there are not sufficient assets to pay all the legacies, the position of the legatees depends on the nature of the legacy.

1. If a legacy be *general*, *i.e.* if it does not refer to any specific thing, it is liable to be reduced in proportion to the deficiency of assets.

2. If a legacy is *specific*, *i.e.* if it is of a specific thing, the legatee is entitled to such thing unless the testator has parted with it in his lifetime.

3. If a legacy is *demonstrative*, *i.e.* if it is in its nature general, but a specific fund has been mentioned out of which it is to be paid, it is not affected by the alienation of such fund during the testator's lifetime, and it is not liable to be reduced until the fund out of which it is payable is exhausted.

[Snell's *Equity*, 14th ed. 1905.—Williams on *Executors and Administrators*, London, 1893.—The rule of perpetuities applies to legacies, *i.e.* the corpus cannot be rendered inalienable for a longer period than a life or a series of lives in being at the date of the testator's death and twenty-one years afterwards. A legacy for superstitious uses is void (Goodeve, *Personal Property*, London, 1892). As regards the limitation of the power of bequeathing legacies, see Mill's *Pol. Econ.*, bk. v. ch. ix.; and Bentham's Works, edited by Bowring, Edinburgh, 1843, vol. ii. (see BEQUEST, POWER OF; DEATH DUTIES)].

J. E. C. M.

LEGACY DUTIES. See DEATH DUTIES.

LEGAL TENDER. The phrase "legal tender," in its primary acceptation, denotes a valid offer of payment of a debt; in its secondary and derivative sense, that which can be validly offered—that particular species of money which, in the absence of special agreement to the contrary, creditors are by law bound to accept in payment of debts. Where the mode of payment has been clearly laid down in the original CONTRACT, governments have, save in the case of some particular species of contracts (see TRUCK ACTS), in general restricted themselves to enforcing when necessary the contract thus made. But, to avert the evils incident to uncertainty in the interpretation of contracts, it has usually been found necessary to give a precise definition of what will, in the absence of agreement to the contrary, constitute a legal tender of payment of a debt.

What money is legal tender? In this country the current coin of the realm is legal tender—gold for payment of any amount, silver for a payment not exceeding forty shillings, bronze for a payment not exceeding one shilling (33 Vict. c. 10, § 4). Bank of England notes, payable to bearer on demand, are, except at the bank itself or its branches, legal tender for all sums above five pounds, so long as the bank continues to pay on demand its notes in legal coin (3 & 4 Will. IV. c. 98, § 6). Bank of England notes, however, are not legal tender in Scotland or Ireland; nor are the notes of the English country banks, or of the Scotch and Irish banks, legal tender anywhere. But a tender of payment in money other than legal tender (*e.g.* country bank notes, or a cheque, or silver coin for a debt exceeding 40s.) will, if otherwise valid, be sufficient, unless objected to on that account.

In the United States of America, U.S. gold coins are (1895) legal tender for any sum; as also the U.S. silver dollar, except in the case of agreement to the contrary. The smaller silver coins are legal tender for a sum not exceeding ten dollars (say £2). For the extent to which United States notes are legal tender see BANK NOTE (U.S.A.). See also BIMETALLISM; CIRCULATING MEDIUM; CONVERTIBILITY OF BANK NOTES; COLONIES, CURRENCY IN; CURRENCY; DEBASEMENT OF COIN, HIST. OF; INCONVERTIBLE CURRENCY.

Supposing the *quality* of the tender unobjectionable, *what constitutes a legal tender of it?* By English law the debtor must produce and offer—unless the creditor clearly dispense with production—to the creditor, or to one who is presumably his authorised agent and does not disclaim authority, the sum due, at the proper time and place, and so that the creditor or his agent can examine and count the money. The tender must be unconditional, *e.g.* it must not involve an admission by the creditor that no more is due, or that it itself is not due. A tender by one of several joint debtors, or to one of several joint creditors, is valid as tender by, or to, all. Tender of more than is due is valid, but not if change is required and the creditor objects to give it. Tender of a part of an entire debt is not valid, and there can be legal tender of one of several distinct debts only if the debt be specified on account of which the tender is made.

[See Jevons, *Money and the Mechanism of Exchange*, 8th ed. 1887.—F. A. Walker, *Money*. 1878.—Smith's *Mercantile Law*, 10th ed. 1890, pp. 667 *seq.*—Benjamin, *On Sales*, 4th ed. 1888, pp. 714 *seq.*]

A. B. C.

LEGATUM, in Roman law, is a bequest to a person by will of a formal kind, charged by the testator on the universal successor, *heres*, to whom he leaves his entire property. The *legatarius* or legatee, the object of the testator's bounty, being only a particular successor, does not, like the *heres*, incur any liability for the testator's debts. The form of the *legatum*, which is not that of request, but of command, distinguishes it from the FIDEICOMMISSUM (*q.v.*).

E. A. W.

LEGISLATION (ELIZABETHAN). More than one hundred statutes, dealing with the social and economic questions of the reign of Elizabeth, were passed between 1558 and 1601. If we add to these the numerous private acts of a similar character and the public acts which had only an indirect relation to economic affairs, we have to contemplate a legislative achievement which for permanent and far-reaching results is without parallel in the history of England. It is impossible within the limits of an article to give a complete analysis of these statutes, still less to trace in detail the results of their operation. Whether

we regard the remarkable unity of purpose with which they are pervaded, the skill with which they make use of the social and political influences of the time, or the expedition with which they were framed, criticised, amended, and passed into law, they are of the greatest importance in the economic development of the country. To understand their full significance they should be considered in their mutual relations to one another. They represent a deliberate and, on the whole, a successful attempt to grapple with the problems of the reign of Elizabeth on the principles of the MERCANTILE SYSTEM (*q.v.*). They are, in fact, the embodiment of that system at its best, before it had degenerated into a mere chaotic mass of tariff regulations for the protection of the interests of small groups of merchants and manufacturers. In spite of the economic errors which it was difficult if not impossible to avoid in that age, the acts for the encouragement of agriculture and navigation, the statute of apprenticeship, and the acts dealing with pauperism, are, in relation to the political theories and social structure of the 16th century, worthy of the admiration with which they have been regarded. A list of the acts passed in a single year, the fifth of Elizabeth (1562-1563), will give some idea of the activity of the Elizabethan parliaments. There were acts (1) "for the mayntenance and increase of tillage" (c. 2); (2) "for the reliefe of the poor" (c. 3); (3) "touching dyvers orders for artificers, laborers, servantes of husbandrye, and apprentises"—APPRENTICESHIP, STATUTE OF (*q.v.*) (c. 4); (4) "touching certayne politique constitutions made for the maintenance of the navye"—NAVIGATION LAWS (*q.v.*) (c. 5); (5) "agaynste suche as shall sell any ware for appareill without readye moneye" (c. 6); (6) "for thadvoyding of dyvers forreyne wares made by handye craftsmen beyonde the seas" (c. 7); (7) "touching tanners, couriours, shoemakers, and other artyficers occupying the cutting of leather" (c. 8); (8) to revive 21 Hen. VIII., "touching servantes embeaselyng theyre maysters gooddes" (c. 10); (9) "agaynst clyppyng, washing, rounding, or fylyng of coynes" (c. 11); (10) "touching badgers of corne and droves of cattell to be lycensed" (c. 12); (11) to continue 2 & 3 Ph. and M. "for the amending of highe wayes" (c. 13); (12) "for the punishement of vagabondes callyng themselfes Egiptians" (c. 20); (13) "for the punishment of unlawfull taking of fishe, deare, or hawkes" (c. 21); (14) "agaynste the caryeing of sheepskins, etc., over the sea, not being staple wares" (c. 22). Of the more important of these acts, the statute of apprenticeship was not further amended during the reign of Elizabeth, though its operation was indirectly affected by the changes which took place in the poor-law (14 Eliz. c. 5; 18 Eliz. c. 3; 35 Eliz. c. 4; 39 Eliz. cc. 3, 4, 5; 43 Eliz. c. 2). For subsequent legislation in continuation or amendment of the act for the maintenance of tillage, reference should be made to 13 Eliz. c. 13; 31 Eliz. c. 7, 39 Eliz. cc. 1, 2, and some clauses of the Navigation Acts (1 Eliz. c. 13; 13 Eliz. c. 11; 23 Eliz. c. 7; 39 Eliz. c. 10) have an important bearing on the same subject. Other statutes which should be noticed are those making felony the exportation of leather, tallow, and raw hides (1 Eliz. c. 10), for the incorporation of merchant adventurers for the discovery of new trades (8 Eliz. c. 17), and "agaynst usurie" (13 Eliz. c. 8). The principles of this legislation were not new. The ordinance (1349) and the statute of labourers (1351) may be said to have contained the germ of subsequent legislation on the regulation of wages and pauperism. Navigation acts had been passed in the reign of Richard II. But there are seldom entirely new departures in economic legislation. It is the sagacity with which old laws were repealed, modified, or extended to new problems which distinguishes the reign of Elizabeth as a great constructive age. The bills which became law were only a small proportion of those actually considered by parliament or the committee appointed for that purpose. Statutes were framed and got through both Houses with great expedition, but not hastily or without careful consideration. The development of the poor-law well illustrates the procedure in regard to all the economic legislation of this period. The interest in the subject was so great in 1571 that there was a debate on the first reading of a measure introduced into the House of Commons. This bill was rejected or allowed to drop in the Lords, and a second bill introduced in that House on 12th May 1572. It passed the final stage on 4th June, although during the interval there had been considerable disagreement between the two Houses, and conferences had been necessary. In 1597, when the poor-law for practical purposes reached its final state, one committee had no fewer than eleven bills under consideration, all relating to pauperism. Sometimes there took place a lively debate in a full House, as in the case of the Usury Act of 1571. But as a rule the work was done by committees consisting of Bacon, Cecil, Raleigh, and other well-known men, who met day after day until the legislation was put into shape. An account of the administration of the Elizabeth acts would involve the economic history of England until the early part of the 19th century.

W. A. S. H.

LE GENDRE, François (17th century), was the author of *l'Arithmétique en sa perfection mise en pratique selon l'usage des Financiers, Banquiers, et Marchands*, which went through ten editions from 1646 to 1691, and was even reprinted in 1806 and 1813.

Le Gendre is thought by Professor Oncken to be probably the French merchant who, according to the *Mémoires Historiques* of de la Houssaye (1731), answered Colbert: "*Laissez nous faire,*" when consulted by the minister, with some other leading merchants, as to the best method for the improvement of trade. De la Houssaye puts the reply in the mouth of an Orleans merchant named Hazon. See Arts. on Laissez-Faire.

[August Oncken, *Die Maxime Laissez-faire*, Bern, 1886, pp. 22-38.] E. Ca.

LEGITIM. A term in Scots law. It signifies the right of succession of children to the personal estate of their father to the extent of one-third. This right vests in them at their father's death, and is indefeasible by his will. It may, however, be expressly renounced by any child, or discharged by special provision.

M. G. D.

LEGOYT, Alfred (1815-1885). Legoyt, an eminent French civil servant, statistician, and economist, began life as a lawyer, but soon entered the public service in the office of the ministry of the interior. In 1839 he already occupied the posts of *Chef de Bureau de l'administration générale*, and of *Secrétaire de la Commission Permanente des Archives*. In 1852 he succeeded Moreau de Jonnès as *Directeur du Bureau de la Statistique Générale de la France*, which post he held until an advanced age. He accomplished much useful work in his department, including the establishment of the extensive system of agricultural and industrial statistics which exist in France.

Among his later works may be mentioned his essay on *Les Forces Matérielles de l'Empire Allemand*, published in 1877, and his remarkable monograph on *Suicide*, published in 1881.

W. H.

LE HARDY DE BEAULIEU, Charles, (1816-1871), was born at Uccle near Brussels and died at Mons. He was one of the most scientific popularisers of economics of his time.

His remarks, "The intervention of the state in all branches of human activity is suitable in the infancy of societies: . . . The system of liberty characterises manhood," show a man deeply liberal in mind. He showed himself clearly the disciple of Adam Smith, of J. B. Say, of Bastiat, of Dunoyer, and of M. Gustave de Molinari. He was a very able mining engineer, but becoming blind at the age of forty-two, he devoted himself exclusively to moral and political science. A free trader by conviction, he laboured for the cause of commercial liberty in Belgium.

The chief of De Beaulieu's economic writings are, *Du Salaire*, 1st ed. 1858-59; 2nd ed. 1862, 8vo; *Traité élementaire d'économie politique*, 1861, 8vo; *La Propriété et sa rente*, 1862, 8vo. A. C. f.

LEIB, Johann Georg (beginning of the 18th century), was one of the numerous German authors whom the contemporary methods of the French administration filled with admiration; according to his opinion, everything "which belongs to *Oeconomia regia* was perfectly well understood in France."

In his principal work, *Von Verbesserung Land und Leuten*, Leipzig and Frankfort, 1780, Leib describes the leading object of statesmanship—"to keep money in the country and invite in money from its neighbours." He divides the population into the sustentative (*nahrhafte*) classes, comprising artisans, peasants, and merchants, and the unsustentative (*nichtnahrhafte*) classes; still, even peasants are only producers in so far as their productiveness conforms to the above leading principle.

[Roscher, *Gesch. der Nat. Oek. in Deutschland*, p. 302.] E. Ca.

LEIBNIZ (Leibnitz), Baron Gottfried Wilhelm von (1646-1716), was too universal in genius and sympathies not to devote time and energy to the consideration of economic problems. In his correspondence he claimed to have studied them, and especially those connected with currency, even to the extent of studying mines and metallurgy, "as much as any one," and to have accumulated much material on this subject. He held that "political economy was by far the greatest part of political science" (Dutens, v. 214 *et seq.*), and urged that economic knowledge, "for lack of which Germany was perishing," should to a greater extent be imparted in education (v. 175 *et seq.*). But beyond the weight of his influence and counsels applied where his position as philosopher and statesman gave opportunity, and a few judgments on economic matters scattered amongst his political monographs and his letters, he has left no contribution to economic thought, but room instead for regret that a scholar so eminently fitted, as Roscher has remarked, by his philosophic breadth of vision, his mathematical and judicial perspicacity, and his sympathetic interest in, and sagacious judgments respecting, the actual condition and course of affairs, to have been a great economist, should not have anticipated Adam Smith by a century. The task of gleaning from his writings the scattered judgments alluded to has been efficiently carried out in Roscher's *Geschichte der Nationaloekonomik* (cp. xvii. pp. 329 *et seq.*), and may here be summarised. Leibniz formulated the sources of wealth by saying that "the strength of a country lies *in terra, rebus, hominibus*" (iv. 531), but especially *in hominum numero* (iv. 502); in connection with which latter statement we find him estimating the population of Prussia by multiplying the annual number of births by thirty. He would not admit opposing interests in trade and agriculture, but saw only an economic harmony which taxation should be so adjusted as not

to disturb. Agriculture was to commerce and manufactures as the root and trunk of a tree to the branches (v. 577). Elaboration of matter involves waste. A nation exporting raw material only to reimport it when made up is as a man who consents to buy of a thief a horse identical with the one of which he has been robbed, because of this sole difference that it has lost its tail (Onno Klopp, *Die Werke von Leibniz*, Hanover, 1864, i. 140). He warmly praised Locke's writings on currency, but held that our restoration of the coinage in 1696 was too costly, if magnanimous. He held it was no use to establish a sound currency without also establishing a *tarif raisonnable* of the prices of commodities, else we get into the circle of measuring money by money (Dutens, vi. 250). The regulation of the currency could only be effectively carried out by international agreement (233-266). He approved of interest (v. 480), but mostly hoarded his own capital, and he had a mathematician's weakness for lotteries (v. 533).

Leibniz' works are in several collections, not one complete. *Opera*, ed. G. G. Dutens (Geneva, 1768, 6 vols. 4to.); German ed. by Pertz and Gerhardt (19 vols., 1873-90), and by O. Klopp (11 vols., 1862-84), and one in French, by Foucher de Careil, 1859, etc., to which the pages quoted refer.) C. A. F.

LEMONNIER, Charles (b. 1808). A French advocate, in early youth a fervent disciple of St. Simon (*q.v.*), a selected edition of whose works he edited in 1859. He practised at the Bordeaux bar.

In 1843 he published *Commentaire sur les principales polices d'assurance maritime usitées en France* (*Paris, Bordeaux, Marseilles, Le Havre, Nantes, Rouen, Dunkerque, Bayonne*), Paris, 8vo, 2 vols., a work of recognised authority. Lemonnier was one of the founders of "la ligue internationale de la paix et de la liberté," and a regular contributor to its journal, *Les États unis d'Europe.*—*Les bases d'une organisation fédérale de l'Europe*, appeared in its pages. *La question sociale*, Paris, 1871, 8vo, is a reprint of an address delivered at a meeting of the League at Lausanne. Political economy, being a branch of morals, is founded, like the latter, on the independence and liberty of the individual. Following Rousseau and Locke, Lemonnier maintains that the foundation of the social contract is property; at the same time great alterations in the law are needed, to secure its proper diffusion.

[Introduction to *Les États unis d'Europe*, Paris, 1872, 16mo, by V. Poupin.] H. E. E.

LENDA or Lezda, inland custom duties paid by merchants in Aragon. The *lenda maritima* was equivalent to our modern customs. E. Ca.

LENZI, Domenico (14th century). A Florentine; among many writers on economic subjects, of that period, Lenzi, a corn chandler, is noted for a history of the prices of provisions, and of the complaints of the frequenters of the Mercato Vecchio, Florence, against the officials who levied the tax on provisions. He also initiated ideas of greater freedom in trade.

Specchio umano o Diario di Domenico Lenzi (1320-1335), pub. with illust. by P. V. Fineschi, ent. *Storia compendiata di alcune carestie edovizie di grano, occorse in Firenze*, Florence, Viviani, 1767.

LÉONCE DE LAVERGNE (Louis Gabriel Léonce Guilhard de). See Lavergne, L. G. L. G. de.

LE PLAY, Pierre Guillaume Frédéric (1806-1882), though not, in many respects, to be classed among strict economists, exercised a profound influence upon economic study by the originality of his work and the strength of his following. The son of a custom-house officer, he was born at La Rivière Saint-Sauveur, a village near Honfleur, was educated at the *École Polytechnique* in Paris, where he distinguished himself in mathematics and natural science, and, on passing out of the school, entered the service of the state as a mining engineer, in which capacity he showed great energy and powers of observation. In 1832 he was appointed co-editor of the *Annales des Mines*, in 1834 head of the newly-formed permanent committee of mining statistics, and in 1840 professor of metallurgy at the school of mines. He systematically spent his long vacations in foreign travel, closely observing not only the nature of the soils and their mineral deposits, but also the peoples who dwelt upon them, and the works, especially of steel, iron, copper, etc., in which they were employed. He commenced these voyages in 1829 by a visit of seven months to Germany, Belgium, and Holland; and subsequently extended his travels to England, Spain, Denmark, Sweden and Norway, Austria, Hungary, Italy, Switzerland, Russia, and the west of Asia, returning to England, *e.g.*, as often as seven times. The early fruits of these studies are *Observations sur le mouvement commercial des principales substances minérales entre la France et les puissances étrangères, pendant les douze dernières années, et particulièrement pendant les années 1829-31* (published in the *Annales des Mines*, 1832); *Observations sur l'histoire naturelle et la richesse minérale de l'Espagne*, 8vo, 1834 (at the request of the Spanish government); *Vues générales sur la statistique, suivies d'un aperçu d'une statistique générale de la France*, 1840; and *Descriptions des procédés métallurgiques employés dans le pays de Galles pour la fabrication du cuivre, et recherches sur l'état actuel et sur l'avenir probable de la production et du commerce de ce métal*, 496 pp., 8vo, 1840. In 1851 he was sent by the government to London to report upon the cutlery and steel instruments exhibited at the great exhibition, and in 1855 was

entrusted with the arrangement and classification of products at the Paris exhibition, of which he became commissioner-general. He held the same post on behalf of France at the London exhibition of 1862, and at the French exhibition of 1867; and was created counsellor of state in 1855, and senator in 1867, in recognition of these services. After the senate fell with the empire in 1870 he did not seek to re-enter Parliament, but devoted the remaining twelve years of his life to the propagation of his views upon social peace and the reconciliation of material progress with industrial harmony. In the course of the travels already referred to, Le Play had minutely studied the lives and economic circumstances of some 300 families, considered by local authorities to be fairly typical of their class, and had noted a multitude of facts with regard to them in the hope that comparison and induction would disclose the factors upon which the well-being of families really depends. A selection of thirty-six of the most valuable and complete of these family monographs constituted his great work, *Les Ouvriers Européens* (1st edition, a luxurious folio printed at the Imprimerie Nationale, 1855; 2nd edition enlarged, 6 vols., 8vo, 1877-79). The core of each monograph is an elaborate budget of the yearly receipts and expenses of the family, each item figuring separately with its quantity and average price. Capital is also taken into account, and inventories with prices are given of every article possessed by the family, while income or consumption in kind is carefully accounted for, and every accessory portion of revenue is rigidly traced to its precise source. The budgets thus framed are the most technically exact and complete which have yet appeared, and must serve as models for all further studies of this kind. Grouped round the budget are numerous classified details which influence or explain the budget itself, such as the composition of the family in age, sex, number; history of the family; morals and hygiene; nature of employment; means of existence; mode of existence, number and nature of meals, kind of dwelling, furniture, clothing, recreation; and excursuses upon large general questions or small particular details incidentally suggested by the budget. The academy rewarded the book on its appearance with the Monthyon prize of statistics. In 1856 Le Play founded the *Société internationale des études pratiques d'Économie Sociale* to pursue these studies in different countries. The society received and has retained the support of a great number of persons, including the most eminent of French economists, and still publishes every three months a family monograph in its series *Les Ouvriers des deux mondes*. In 1881 the society commenced the publication of an economic journal, *La Réforme Sociale* (still flourishing, published fortnightly), which is read also by the two or three thousand members of the *Unions de la Paix Sociale*, or small local clubs, founded in 1872, to study and apply the methods of Le Play. The members of the *Société d'Economie Sociale* also meet periodically for discussions, banquets, etc.

The facts tabulated in the family budgets, while highly valuable, suggestive, and even inspiring, have not yet yielded any economic generalisations. On this side the study is merely objective, not inductive. The principal conclusions arrived at by Le Play himself bear rather upon the morals than the economics of industry. They are, *e.g.*, the duty of the employer to promote with paternal care (*patronage*), yet unobtrusively, the material comfort and moral well-being of his employés and their families, and not to content himself with a cash-nexus; the importance of preserving the family as a cohesive element in society, and, to this end, the advantage of free power of testation (see BEQUEST, POWER OF); the duty of the state to protect the weak and injured, and to provide, as in England, a remedy for seduction by an action for damages; the advisability of maintaining local and flexible customs rather than imposing from above general and inflexible regulations; and the advantages of perquisites and privileges as a sauce to wages. Such considerations, notwithstanding their importance, belong chiefly to the domain of the statesman rather than the economist. The careful studies of fact made and recorded by the school of Le Play, in their monographs and their journal, are of great value to economists; but Le Play himself rated theory too low to impose any dogma of theory upon his followers, and economists of varied shades of thought are thus enabled to unite among his following in spite of their divergencies of view.

The *Ouvriers Européens* was a collection of facts. *La Réforme Sociale* (2 vols., 8vo, 1864, 7th ed. 3 vols., 18mo, 1887) is the sequel of conclusions mainly moral. The other chief works of Le Play are *L'Organisation du Travail*, 1870 (an American translation by G. Emerson, Philadelphia, 1872; and a Spanish translation, 1894); *L'Organisation de la famille*, 1872; *La Constitution de l'Angleterre* (in collaboration with M. Delaire), 1875; *La constitution essentielle de l'humanité*, 1880.

Le Play had evidently no scientific training in economic theory. His grievances against Adam Smith and Malthus, for example, are largely imaginary, and would have been dispelled by personal acquaintance with their works. His ambition to achieve for social science the success which observation, classification, and comparison had rendered to natural science, can hardly be said to have been achieved; but his mineralogical knowledge, joined to natural sagacity and penetration, aid

him to throw into strong relief the influence of environment and "outside" circumstances upon the fate of industries and of individuals, while his close study of the family shows clearly the modifications which pure theory, on a hypothesis of perfectly "fluid" individuals, must admit before it corresponds to the facts of real life. His division of the stages of civilisation into three groups according as the family is patriarchal or stable (with community of goods), a *famille-souche* or family stock (with primogeniture and younger branches), or, lastly, unstable (with forced partition, as in France), belongs rather to sociology than to economics, and is not invulnerable to criticism. It was indeed partly from schism on this point, partly from other motives, that a small dissident group of Le Play's disciples has been formed, who claim to develop rather than stereotype his method. Their journal is *La Science Sociale*. The *Société d'Économie Sociale* has branches in almost all countries. The most active and vigorous is that of Belgium.

"The school of Le Play," says Professor Gide, "seeks to re-establish social peace by authority in a threefold form: that of the father in the family, the master in the factory, the church in the state, with the condition of reciprocal duties on the part of these social authorities" (*Prin. d'Écon. Pol.*, 4th ed. 1894, p. 35); and he points out that it has departed from the traditional optimism of the economists, classical and socialist, in France. This definition of their principles is not entirely accepted by Le Play's followers, who contend that devotion to social duty and moral responsibility rather than authority are the true watchwords of the school.

[See FRENCH SCHOOL; CHRISTIANITY AND ECONOMICS; (ROMAN CATHOLIC SCHOOL); article on "Le Play" by Henry Higgs, in *Harvard Quarterly Journal of Economics*, June 1890.—"Les cent monographies de famille comparées" . . . by Cheysson and Tocqué in *Bulletin de l'Institut International de Statistique*, 1893.—"Workmen's Budgets," by Henry Higgs, *Journal Royal Stat. LEPTON (modern Greek coin). Equivalent of the French centime (see CENT; CENTESIMI).

LEROUX, PIERRE (1797-1871), born and died at Paris, was a philosopher rather than a socialist. After hard but desultory studies he became a printer, and in 1824 established *Le Globe*, which periodical he devoted in 1831 to St. Simonism.

A few months after, he, with Bazard, separated himself utterly from his coreligionists, who met in the Rue Monsigny, on the occasion of the publication of Enfantin's views on, or rather against, marriage. Leroux then became chief editor of the *Revue Encyclopédique*; established in 1819 and abandoned in 1833, sixty-two volumes, two being tables. In 1838 he started, with Jean Reynaud, *L'Encyclopédie nouvelle*, a monumental work never completed through lack of funds; eight volumes only appeared, 1838-41, in small quarto.

Having been appointed a member of the constituent assembly in June 1848, he was implicated in the proceedings resulting from the attempt of 15th May against that body, but it was soon seen that he had been calumniated. He was again elected in 1849 to the legislative assembly. When the *coup d'état* of December 1851 occurred, he was exiled and lived out of France until his return at the end of the last empire. He died at Paris during the commune, and was honoured by a public funeral, being looked upon rather as the head of the socialist school than as a theosophist.

As a philosopher, Leroux opposed the ideas of the eclectic school as exemplified by Cousin and Henry Jouffroy, and substituted pantheism slightly tinged with materialism. He also believed in the transmigration of souls, a doctrine incompatible with individuality. Man is only part of a whole, proceeding thence at birth to return thither at death, and to leave it again, but on a higher level, —a progress repeated incessantly and eternally in the past and in the future. Again, with Pythagoras, he accepted the power of number. The "triad," or group of three, played an important part in the development of his philosophico-socialist ideas. Man is sensation, or sentiment, or intellect. He may be, and sometimes is, all three at once, but one of these tendencies predominates in him. The union of three individualities, one possessing sensibility (imagination), another sentiment (the heart), the third knowledge (reason), as the predominating quality is indispensable for the realisation of progress. Social harmony results from this triad, which Pierre Leroux discovers in God—as power, love, intelligence; in the family—as father, mother, and child; in the nation—city, commune, state; in the people—citizen, partner, functionary; in the motto of the French republic —Liberty, Equality, and Fraternity (perhaps author of it); in production—capital, labour, land, etc., etc. Pierre Leroux discovers it everywhere, attributing to it a secret power, recalling the astrologers of the middle ages. The reasoned proof of this pretended law must not be asked of Pierre Leroux; he takes little pains to demonstrate it—he asserts and prophesies at random. Besides this, though he never betrayed pontifical tendencies like Enfantin and Auguste Comte, he proposed to establish a religion. His socialism was entirely speculative. He neither sought to enthrall by brute force nor to inveigle people to his ideas. Thoroughly sincere in his errors, but convinced that he was right, he set forth his doctrines with warmth, with an eloquence often marred by wilful exaggerations, by intentional repetitions wearisome to the reader.

He was an ardent partisan of equality not only in public but in private life. He approved meals in common. Individuality according to him is an evil, collective action alone promotes the welfare

of humanity. The state holding the instruments of production in its own hands is to distribute work according to the capabilities of every man, to divide the results according to the necessities of every man. Property, through inequality, is the scapegoat charged with all the sins of this world. He thus reaches a collectivism and even a communism which anarchists would consider rather reactionary nowadays. However, he preserves the family and unreservedly asserts the existence of God. But he denounces Malthus and his disciples at least as vigorously as Proudhon did.

There is nothing new in the economic ideas of Pierre Leroux, except his intemperate declamations against society, embodied in a great mass of quotations generally warped from their right meaning by change of surroundings, but showing the extent of his reading, ill directed as it was. Pierre Leroux, with his great intelligence, could, by methodical and close study, have produced useful and durable works. He preferred the easier road of half-knowledge and substituted sophisms for science, thus flattering the ignorance of the masses and obtaining some popularity, though without having aimed at it.

Pierre Leroux was sincere and did not deserve the epithets of quack and mountebank which Proudhon less than any one else had the right to apply to him. He lived simply, even for a workman of his condition. His private life won the esteem of all who knew him.

Leroux wrote much ; the following are his principal works :—*De l'humanité*, 2 vols. 8vo, 1st ed. 1840, 2nd ed. 1845 (contains an article in the *Revue des deux mondes* of 15th February 1836 on "Le Bonheur").—*De l'Egalité*, 1st ed. 1838, 2nd. ed. 1848, 8vo, composed of articles which appeared in the *Encyclopédie nouvelle*.—*De la ploutocratie ou du gouvernement des riches*, 16mo, 1848, an article which appeared in 1843 in the *Revue indépendante*, a monthly republican publication established by Mme. Georges Sand in Nov. 1841, in opposition to the *Revue des deux mondes*, the monarchical periodical of that time. The *Revue indépendante* ceased to appear 24th February 1848, and forms 39 vols. 8vo).—*D'une religion nationale ou du culte*, 1844.—*Malthus et les économistes, ou y aura-t-il toujours des pauvres*, 1849 ; articles which appeared in 1846 in the *Revue Sociale*, a monthly periodical started by Pierre Leroux in October 1845, with this sub-title, *Ou solution pacifique du problème du prolétariat*. It ceased to appear in 1847.—*Discours sur la situation actuelle de la société et de l'ésprit humain ;* one vol. 8vo, in 1841, in two vols. 12mo, 1847,—a reproduction of several articles published before 1841.—*Le carrosse de M. Aguado*, a fragment, 8vo, 1848.—*Du christianisme et de son origine démocratique*, 12mo, 1848, an extract from the *Encyclopédie nouvelle*.—*Projet d'une constitution démocratique et sociale*, 8vo, 1848.—*La grève de Samarez*, a philosophic poem, Paris, 1864, unfinished, only three parts appeared. A. C. f.

LESLIE, Thomas Edward Cliffe (1825 ?-1882), was born in the county of Wexford, Ireland. The year of his birth is commonly said to have been 1827, and that date appears on his monument at Belfast; but according to the matriculation book of Trinity College, it was 1825. He was the son of an Anglican clergyman. After receiving some instruction in the classics from his father, he was sent to King William's College in the Isle of Man. In 1842 he entered the university of Dublin. It is worthy of notice that John E. Cairnes, William E. Hearn, author of *Plutology* and *The Aryan Household*, and Richard H. Walsh, afterwards professor of political economy at Dublin, and author of a work on *Metallic Currency*, were in the same class with Leslie. He obtained a scholarship in Trinity College, a distinction then to be won only by classical knowledge, and graduated as senior moderator in logics and ethics in 1847. He was called to the bar in 1848 ; but in 1853, ceasing to seek practice, became professor of political economy and jurisprudence in Queen's College, Belfast, continuing, however, to reside in London. He now devoted himself altogether to economic and social studies, and during the following years wrote many articles in different periodicals on questions of the day. He travelled on the Continent in his holidays, and studied personally the economic condition of France, Belgium, and Germany, especially of the rural population in those countries. The writings founded on these observations attracted much attention, and excited the admiration of J. S. Mill ; a good specimen of them is supplied by the essay on Auvergne. In the course of these tours he made the acquaintance of some distinguished men—amongst them, of L. de Lavergne and E. de Laveleye ; to the memory of the former of these he paid a warm tribute in an obituary notice in the *Fortnightly Review* for February 1881 ; and with the latter he continued in relations of cordial intimacy to the close of his life.

In 1870 he published *Land Systems and Industrial Economy of Ireland, England, and Continental Countries ;* and two essays of his appeared in volumes issued under the auspices of the Cobden Club, one on the *Land System of France*, 2nd ed., 1870, a defence of peasant proprietorship ; and the other on *Financial Reform*, 2nd ed., 1871, a criticism of the system of indirect taxation. In 1879 he collected a number of his scattered papers under the title of *Essays in Political and Moral Philosophy*. A second edition of this volume has appeared since his death, in which some of the essays have been omitted ; and others, written after 1879, have been included. Those who would either understand the character of his mind, or conceive aright his systematic views on political economy, must study both these volumes. He had now arrived at the fulness of his powers ; he had matured his opinions, and extended his experience and knowledge in various directions. It was natural to expect

from him something designed on a larger scale than anything he had yet produced. He was known to have been long engaged in preparing an economic and legal history of England. But the manuscript was, unfortunately, lost in some unexplained way during a tour in France, and the book was never rewritten. The article on the "History and Future of Profit" in *Fort. Review*, Nov. 1881, "is believed to have been in substance and form an extract from it." The papers he left behind contained many notes, references, and isolated passages, intended beyond doubt as materials towards this work, but nothing was found sufficiently complete or coherent to be given to the world. He had suffered for years from a painful malady, recurring at uncertain intervals, which often made intellectual exertion impossible; so that, whilst some perhaps thought he might have done more, those who knew him wondered that he was able to do so much. He sank under one of the attacks of this disease during a visit to Belfast on professorial duty.

Leslie has treated several special subjects, such as PRICES, WAGES, the DISTRIBUTION OF THE PRECIOUS METALS, and the Irish agrarian question, with great ability. But the eminent service which secures to him a permanent place in the history of social science was that of having founded the English historical school of political economy. He was the first of our fellow-countrymen to lay down and defend the philosophical principles on which the HISTORICAL METHOD rests. This he did to some extent in earlier writings; but what may be called his decisive manifesto on the subject was an essay which appeared in the Dublin university periodical, *Hermathena* (vol. iv. 1876), followed up by an article entitled "Political Economy and Sociology," in the *Fortnightly Review* for January 1879.

He has himself mentioned that the first influence which inclined him in this historical direction was that of Sir Henry Maine, whose lectures he had attended as a law student. Maine had represented existing juristic institutions as the result of a long evolution, and Leslie was thus led to apply the same method to the economic phenomena of society. At a later period he became acquainted with Roscher's *Geschichte der National-Oekonomie in Deutschland*, and gave an account of it in the *Fortnightly Review;* and he also mentions with marked commendation Knies's well-known treatise on economic method. He was, however, by no means a mere copyist of these works, but approached the whole subject from an independent point of view of his own, though well acquainted with the general line taken by Roscher and other German economists. He was also much influenced by the *Philosophie Positive* of Auguste Comte, of whose "prodigious genius" he speaks in one of his essays, though he did not accept the social polity or the religious system of that great thinker. But, after allowing for all these influences, there remain in the way in which he presents, vindicates, illustrates, and applies the method, such freshness and originality as show it to have been, in the form in which he conceived it, a genuine product of independent thought. Most of what he has left us is fragmentary, but it has a value far more than corresponding to its quantity. His labours, though they have largely modified contemporary opinion, have not yet by any means produced their entire effect, or fully received the recognition they deserve; it may be safely predicted that, with the progress of general sociology, they will be more and more highly appreciated, and he will be seen to have taken a leading part in a great work of scientific reform.

[*Encycl. Brit.*, 9th ed.—*Handw. der Staatswissenschaften.* The present article, like the two here cited, is largely founded on personal knowledge.] J. K. I.

LETROSNE (or LETRÔNE) GUILLAUME FRANÇOIS (1728-80), born at Orleans, died at Paris, began life as a writer on legal subjects and a pupil of the well-known Pothier. At first "natural rights" and the "rights of man" entirely absorbed his intellectual activity, but in 1764 he was attracted by Quesnay and became one of his followers.

Till 1777 Letrosne did not write more than articles for the *Journal de l'agriculture, du commerce, et des finances*, and pamphlets. His most important economic work is *De l'ordre social, ouvrage suivi d'un traité élémentaire sur la valeur, l'argent, la circulation, l'industrie, le commerce intérieur et extérieur*, 2 vols. 8vo, 1777. The first volume, a course of lectures on social order; the second contains a treatise with the special title "De l'interêt social par rapport à la valeur, à la circulation, à l'industrie, et au commerce intérieur et extérieur." This section is reprinted in the collection of Guillaumin (*Physiocrats*, 1846). This work is praiseworthy,—the style is more simple and clear than is usual among the physiocrats. Though Letrosne possessed the *lumen siccum*, he never attained the reputation of Mercier de la Rivière; but his book, *De l'administration provinciale et de la réforme de l'impôt*, followed by a *Dissertation sur la féodalité*, 1779, is still frequently quoted. It is a ponderous volume, scientific in tone, which, from the point of view of the financier, had the advantage of appearing four years before the work of Necker on the administration of the financial affairs of France; and from the point of view of the politician, of appearing ten years before the celebrated night of 5th August 1789. A. C. F.

Eugène Daire, in the short notice of Letrosne in the *Collection des Principaux Economistes*, remarks of tome ii. of the second section of the work mentioned above, *De l'interêt social par rapport à la valeur*, etc., "that it treats the economic questions with which it deals with a depth of view which it is impossible not to recognise."

The school of the physiocrats had complete confidence in the continuity of material progress and in its influence on the welfare of individuals. "No one can live without the aid of his fellows; the labour of others helps us; the transformations of matter, the improvements in transport; the improvements of the land, all inventions past and present, whether near or at a distance, all are useful to us."

The paragraph at the conclusion of Letrosne's book expresses these opinions with force and fulness. "I have shown in this work what is the origin of value and its influence on the revenues and the prosperity of a nation. I have marked out the functions of money, the source and the effect of circulation. I have described the nature of the results of industry and commerce, their usefulness in relation to our wants, but their absolute sterility in relation to the increase of our wealth.

"From these truths I have deduced the *unity of social interests and its conformity with the laws of justice*. . . . The philosophers . . . never cease to tell us that it is necessary to encourage cultivation. We must support industry and look on them as two sisters. Without doubt they are two sisters; but one an elder sister who supports the younger, and the elder sister has never sought for exclusive privilege nor for advantage, nor for bounty against her younger sister. Industry has to be supported, but this should not be by injuring either directly or indirectly the cultivation of the land which supports it. It is not through the leaves, it is through the roots that the tree grows; the leaves adorn it, and even contribute to its growth, but it is the roots which supply the sap which they employ."

LETTER OF ADMINISTRATION. See ADMINISTRATION, LETTERS OF.

LETTER OF ALLOTMENT. A subscriber to a new company, or to an issue of shares, bonds, or public securities, receives, in reply to his application, a letter, properly signed, in which is stated the amount, if any, allotted to him or her. It is usual, on this letter, to specify the amounts payable, and the dates on which they respectively fall due. The letter also contains a receipt for the amount already received from the subscriber.

When an issue takes place of shares of a company which are thought likely to proceed to a premium, the allotment of the shares is often very greatly sought for. Efforts are made by the applicants in many ways to obtain a share in an enterprise which may produce a considerable profit without any serious labour to the applicant, and an undesirable spirit of gambling is thus encouraged. A. E.

LETTER OF APPLICATION. When an issue of shares, bonds, or other securities is offered to the public, those who apply do so in the terms laid down and on the form provided by the PROSPECTUS (*q.v.*). The form is usually a mere request for the allotment of a specified quantity of the issue, the subscriber enclosing a cheque for the stipulated deposit—usually 5 per cent or more of the amount applied for—without which his application will not be entertained. A. E.

LEVI, LEONE (1821-88), economist and statistician, born at Ancona of Jewish parents, in later life became a Christian and a devoted member of the Presbyterian Church. Trained to a commercial career, he went to Liverpool in 1844, to extend his brother's business as commission-agent and merchant. He became naturalised, and acquiring the English language, soon established a connection. After the crisis of 1847, however, the business failed, and he obtained employment in a mercantile house in Liverpool. In 1849 he advocated, in letters to the *Liverpool Albion*, the establishment of representative chambers of commerce, and of permanent tribunals of commerce, constituted of a legally-trained judge, with mercantile assessors. These letters formed the basis of two pamphlets, —*Chambers and Tribunals of Commerce, and proposed General Chamber of Commerce in Liverpool* (1849), and *The State of the Law of Arbitrament, and proposed Tribunal of Commerce* (1850). The Liverpool chamber of commerce was immediately established, with Levi as honorary secretary; similar institutions followed at Leeds, Bradford, Hull, and other centres of industry, and finally in London. As secretary to the Liverpool chamber, Levi acquired through official channels "exact information about foreign chambers of commerce, and the laws applying to commercial transactions in their respective countries." The result was a synopsis of the commercial law of Christendom which might serve as a step towards an international code of commerce. He interested the Prince Consort and other influential personages, and further expounded the scheme in lectures delivered in the chief cities and towns of the kingdom. In 1852 he wrote *Commercial Law: its Principles and Administration; or, the Mercantile Law of Great Britain compared with the Codes and Laws of Commerce of the following Mercantile Countries* (fifty-nine being enumerated), *and the Institutes of Justinian*. The publication became an international event, and gold medals and prizes were showered on the compiler. At Levi's suggestion, a congress was held in November 1852, to discuss practical measures for harmonising the laws of the three kingdoms.

As the result of a royal commission of inquiry, the Mercantile Law Amendment Acts of 1856 were passed, which removed some of the more conspicuous discrepancies between English, Scotch, and Irish law. The commission likewise examined into the expediency of introducing the principle of trading with limited liability into the law of partnership, but to Levi's disappointment reported against the proposal. In 1853 Levi gave evidence before a parliamentary committee in favour of the collection of agricultural statistics, but nothing of importance in this direction was done until thirteen years later. In 1855 he read a paper before the Law Amendment Society, *On Judicial Statistics*, and drafted a bill on the subject which Brougham introduced in the Lords but afterwards withdrew.

Levi was appointed, in 1852, to the newly-constituted chair of commercial law at King's College, London. He removed to the metropolis, and was called to the bar at Lincoln's Inn in 1859. He long and ably discharged the duties of his ill-remunerated professorship. A free-trader by conviction, and not content with arguing against protection on abstract grounds, he collected a large mass of statistics of a practical character. His communications to the meetings of the British Association, and his letters to the *Times* on commercial and financial subjects, gave him a high reputation as a statistician. He was a frequent contributor to the journals of the Statistical Society, and represented the society at foreign congresses. In 1861 he received from the university of Tübingen the degree of doctor of economical and political science. He was honorary secretary of the metric committee of the British Association, and of the international association for promoting one uniform system of weights, measures, and coins. In 1887 Levi visited Italy as a delegate from the Statistical Society to the congress of European statisticians held at Rome. He also visited his native town of Ancona, where he founded, in connection with the technical institute, a free scientific library and a lectureship on the laws of commerce in relation to science and moral international laws.

The following is a list of the most important of Levi's works:—In 1854 he published his *Manual of the Mercantile Law of Great Britain and Ireland*. In support of his views on international arbitration he published *The Law of Nature and Nations as affected by Divine Law*, 1855; *Peace the Handmaid of Commerce, with Remarks on the Eastern Crisis*, 1876; *War and its consequences, Economical, Commercial, Financial, and Moral, with Proposals for the Establishment of a Court of International Reference and Arbitration*, 1881; and *International Law, with Materials for a Code of International Law*, 1887. He also wrote *Annals of British Legislation, being a classified and Analysed Summary of Public Bills, Statutes, Accounts, and Papers, Reports of Committees and of Commissioners, and of Sessional Papers generally of the Houses of Lords and Commons, together with Accounts of Commercial Legislation, Tariffs, and Facts relating to Foreign Countries*, 1856-65. The fourteen volumes of this work were afterwards expanded into eighteen under the title of *Annals of British Legislation*, being a digest of the parliamentary blue-books to 1868.

To the condition, wages, and savings of the working classes Levi paid special attention—see reference to this in papers on Changes in Average Wages, etc., by A. L. Bowley, *Journal of Statistical Society*, June 1895. Among the reports and pamphlets which Levi wrote on those topics are *Wages and Earnings of the Working Classes, with some Facts illustrative of their Economic Condition, from Authentic and Official Sources*, in a report to Mr. Michael T. Bass, M.P., 1867. *Estimate of the amount of Taxation falling on the Working Classes of the United Kingdom*, a report to Mr. M. T. Bass, M.P., 1873. *Work and Pay, or Principles of Industrial Economy;* two courses of lectures delivered to working men in King's College, London, with the report of the committee of the British Association on combinations of labourers and capitalists, 1877. *The Economic Condition of Fishermen*, 1883, being a paper read at a conference at the International Fisheries Exhibition.—*Wages and Earnings of the Working Classes*, a Report to Sir Arthur Bass, 1885.

Levi's most important work was his *History of British Commerce and of the Economic Progress of the British Nation*, 1763-1870, published 1872, second edition 1880, with graphic tables, and a continuation down to 1878. The history embraced the researches of a lifetime, and became a standard work of acknowledged value. In addition to the above, the author published many separate lectures on economic or commercial subjects. He likewise edited treatises on the metric system of weights and measures.

[*Journal of the Royal Statistical Society*, vol. li.—*Men of the Time*, 12th ed.—*Dictionary of National Biography*, vol. xxx.; and the various works of Levi, together with an autobiographical fragment, *The Story of my Life*, privately printed in 1888.] G. B. S.

LEWIS, Sir George Cornewall (1806-1863), was an eminent scholar, author, and statesman.

In 1830, together with J. S. Mill, he attended Austin's lectures on jurisprudence at London University, and, as the first fruit of his studies in this line, there appeared, in 1832, his well-known and suggestive *Remarks on the Use and Abuse of some Political Terms*, an attempt "to illustrate the various uses of the principal terms belonging to political science," undertaken "with the view of affording to political speculation the assistance to be derived from a technical vocabulary" (p. 1).

In 1833 Lewis was appointed assistant-commissioner on the Irish Poor Inquiry Commission, and was shortly afterwards directed to make a particular inquiry into the condition of the poorer Irish resident in the United Kingdom. See his report in appendix to *First Report of Irish Poor Inquiry Commissioners* (*Parl. Papers*, 1836,

xxiv. 427-642), also his *Remarks on the Third Report of the Irish Poor Inquiry Commissioners* (London, 1837). Again in 1834 he was included in the commission to inquire into the state of church property and church affairs generally in Ireland. The facts that came to his knowledge, and the conclusions he arrived at on the Irish problem, are clearly set forth in his *Local Disturbances in Ireland and the Irish Church Question* (London, 1836), in which, *inter alia*, he advocates the introduction of an efficient workhouse system (cp. *Letters*, pp. 47-50, 83-85, 189-191). In January 1839 he succeeded his father, Sir Thomas Frankland Lewis, as one of the three principal poor-law commissioners, and held this difficult post till the commission was dissolved and reconstituted in 1847 (cp. *Letters*, pp. 102, 103, 149-151).

In 1847 Lewis entered parliament, and in Lord John Russell's first administration he held office, first as secretary to the board of control (1847-48), then as under-secretary to the home office (1848-50), and finally as financial secretary to the treasury (1850-52). While at the home office he endeavoured, though without success, to carry bills—(1) abolishing turnpike trusts and placing highways under a mixed county board; (2) amending the law of parochial assessment (*Letters*, pp. 204, 205, 220, 223). Defeated in the general election in 1852, he re-entered parliament in 1855, and shortly afterwards, on the invitation of Lord Palmerston, he reluctantly accepted office as chancellor of the exchequer. To him it fell to meet the financial drain of the Crimean war; and this, in his war budget of 1855 and his transition budget of 1856, he accomplished with a considerable measure of success. Of the total war expenditure, amounting to about seventy millions (see Buxton, *Finance and Politics*, vol. i. p. 155 n.), more than half was contributed by immediate taxation. While he borrowed, he at the same time imposed taxes sufficient, if maintained, to extinguish within a limited period the additional debt; and that this was not effected is to be ascribed mainly to the fact that his statesmanlike proposal, in his budget of 1857, to maintain taxation on a modified war footing till 1860, was only partially adopted. It was on the occasion of introducing the budget of 1857 that Lewis startled friends and opponents by protesting against the principle of simplicity in taxation advocated by Adam Smith (*Wealth of Nations*, M'Culloch's ed., pp. 397-400), and subsequently adopted with striking success as the guiding principle in the fiscal legislation of HUSKISSON, PEEL, and Gladstone. As against this he commended the doctrine of Arthur Young, that taxation should bear "lightly on an infinite number of points, heavily on none" (quoted by Northcote, *Twenty Years of Financial Policy*, p. 309). In November 1857, owing to the existence of an acute commercial crisis, the Bank Charter Act was suspended on Lewis's recommendation (see BANK NOTE; CRISES). To cover this action he obtained the passing of an Indemnity Act in the following month, and at the same time a select committee was appointed to inquire into the working of the Bank Acts.

Lewis was not a great speaker; he lacked the oratorical impulse. But he was at once a quiet, unpretentious scholar of great and varied learning, and a statesman of high principles and reliable judgment; a plain man who could not be ambiguous, and who never mixed, as BAGEHOT puts it (*Biog. Studies*, pp. 208, 209), the diagnosis with the prescription, whose character was marked by a straightforward simplicity, untiring industry, great regard for facts, and a born love of truth. His knowledge was as accurate as it was varied; his conversation itself had "the flavour of exact thought" (*ib.* p. 245). His writings, which cover a vast variety of subjects, and in most of which the influence of Austin's method and teaching is apparent, have suffered somewhat in popularity from their weight of learning. They would probably have been more influential had they been less exhaustive. Those most interesting from the economic stand-point are his works on philosophical and practical politics.

Remarks on the Use and Abuse of some Political Terms, London, 1832; new ed. with notes and appendix by Sir R. K. Wilson, Oxford, 1877.—*An Essay on the Government of Dependencies*, London, 1841; new ed. by C. P. Lucas, Oxford, 1891.—*An Essay on the Influence of Authority in Matters of Opinion*, London, 1849; 2nd ed., London, 1875.—*A Treatise on the Methods of Observation and Reasoning in Politics*, London, 1852, 2 vols. This great "organon for the use of the political inquirer" is, as its author anticipated, little read (cp. *Letters*, pp. 208, 219-220). Besides remarks on the relations between politics, ethics, and economics, it contains discussions on political terms, on the relations between history and theory, on the science, art, and practice of politics, on political induction, the province of experiment, prediction in politics, political ideals, etc., all more or less interesting to the economist (cp. Bagehot, *Biog. Studies*, pp. 238, 239).—*The Financial Statement, 1857, Speech of the Chancellor of the Exchequer in Committee of Supply*, London, 1857.—*Speech on the Introduction of the Bill for the better Government of India*, London, 1858.—*Speeches on Moving the Army Estimates in Committee of Supply in March 1862*, London, 1862.—*Letters of Sir G. C. Lewis to various Friends*, ed. by Sir Gilbert F. Lewis, London, 1870.

[Bagehot's *Biographical Studies*, ed. by R. H. Hutton, 1881, pp. 206-46, 330-33.—*Economic Studies*, 1880, pp. 58, 59, 78.—Walpole's *History of England*, 1880-86, vols. iii. iv. v.—Greville, *Memoirs*, ed. 1888, vols. vii. viii.—Sir S. H. Northcote, *Twenty Years of Financial Policy*, 1862, pp. 264-334, 343-347.—Buxton, *Finance and Politics*, 1888, vol. i. pp. 153-65.—*Dict. of Nat. Biog.*, vol. xxxiii., art. "Lewis, Sir G. C." The bibliography contains a full list of Lewis's contributions to the *Edinburgh Review*, some on economic questions.—*Encyclop. Brit.* vol. xiv.] A. B. C.

LEWIS, MATTHEW or MARK (latter part of 17th century), writer of school-books and of pamphlets describing various schemes for bringing in the millennium by the substitution of credit for money (see MURRAY, Robert). Lewis

apparently anticipated Murray by several years in the proposal to establish storehouses for dead stock on a kind of pawnbroking basis, upon which stock bills of credit were to be issued. Its worth may be estimated from the following example: "Suppose a silk man hath one thousand pounds, he buys silk with it, pawns it in the office for £800; this he lays out [on credit?] again in silk, and pawns that for £700, and so downward. By the help of these banks he lays in four or five thousand pounds' worth of commodities with one thousand pounds." By these methods all the unemployed are to be set to work, and "the running cash of the nation . . . increased it may be a hundredfold, answerable to the credit issued out." The *Proposals . . . how this Tax of £160,000*, etc., gives a brief account of a bank established by the "Signiors of Venice not many years since," by which a £100 bill of credit became worth £120 in specie. Nothing, Lewis contended, would be easier than to start such a bank at home, by raising a local land-tax and issuing credit upon it. This idea he developed in the following year in his *Large Model of a Bank*, and in a separate summary of the same: "Whoever can create such a fund that may give out such bills of exchange (or credit current) that shall be always answered with money when demanded, he doth in effect create so much money." His proposed bills are virtually cheques, drawn *not* on cash but on credit only. The one noticeable suggestion in his proposals (*Short Model*) is that by which the "precinct" in which a local branch of his bank is established is to make good all the acts of this branch in case of local loss or defalcation, a principle which bears some resemblance to the unlimited local liability basis of the German and Italian agricultural banks of the present day.

He wrote: *Proposals to Increase Trade, and to Advance His Majesties Revenue, without any hazard or charge to any body, and with apparent profit to every body*, 1677, 12mo, pp. 16.—*Proposals to the King and Parliament how this Tax of £160,000 per moneth may be raised, by a Monethly Tax for one Year, without any Charge to any particular person, and with great advantage to the whole Nation*, 1677, 8vo, pp. 7.—*Proposals to the King and Parliament, or a Large Model of a Bank; shewing how a Fund of a Bank may be made without much charge, or any hazard, that may give out Bills of Credit to a vast extent, that all Europe will accept of, rather than Mony*, etc., 1678, 8vo, pp. 42.—*A Short Model of a Bank, shewing how a Bank may be erected . . . with apparent profit to every body, except Thieves, Brokers, and Griping Usurers*, etc., n. d. 8vo, pp. 6.

[M'Culloch, *Lit. Pol. Econ.*, pp. 157-159.—H. D. Macleod, *Banking*, ch. ix.] E. D.

LEX LOCI CONTRACTUS. The law of the place in which a contract is made generally governs the rules as to its performance, unless a contrary intention appears from the facts of the case. In many cases, however, the law of the place in which the contract is to be performed (*lex loci solutionis*) must be deemed to be applicable, and, if the contract applies to real property, the law of the place in which the property is situate (*lex situs*). The formal requirements are generally determined by the law of the place where the contract is made, and the conditions as to the contractual capacity of the parties depend upon the law of their respective domiciles.

[As to the English opinions on these matters, see Westlake, *Private International Law*; as to the views of continental writers, see Von Bar, *Internationales Privatrecht*, 2 vols., 2nd ed., 1889.] E. S.

LEX MERCATORIA (see LAW MERCHANT).

LEYMARIE, ACHILLE (1812-1861), a French historian and economist.

Author of a *Histoire du Limousin*, 2 vols. (1845) and of a *Histoire des Paysans en France* (2 vols. 1856). In this work he almost exclusively deals with the legal status of the French peasantry from the Roman Conquest to the French Revolution, principally to the 17th century; their purely economic life, activities, etc., are not investigated. E. Ca.

LIABILITY, LIMITED. Trading with limited liability was sanctioned under the well-known maxim of Roman law, "Si quid universitati debetur singulis non debetur nec quod debet universitas singuli debent" (D. 3, 4, 7, § 1). The members of a corporation were not liable for the corporation debts. Corporate rights, however, were rarely granted in ancient Rome for trade purposes; Justinian's *Digest* mentions as principal instances of trading partnerships with corporate rights those "vectigalium publicarum . . . vel aurifodinarum vel argentifodinarum"; "pistorum . . . et naviculariorum" (D. 3, 4, 1 pr.). During the middle ages partnerships in which one partner was liable for a fixed sum only, known by the name of "commenda"—whence the modern "commandite,"—is derived (see COMMANDITE, SOCIÉTÉ EN), were a favourite form of association. Trading companies with many characteristics of modern limited companies appear in Italy from the 12th century downward. The most powerful of these was the Genoese "Società delle compere e dei banchi di S. Giorgio" existed 1407-1816 (see BANKS, EARLY EUROPEAN). The discoveries of the 16th century gave a fresh stimulus to corporate enterprise, and led to the formation of new companies with limited liability throughout Europe, among which the EAST INDIA COMPANY (*q.v.*) was the most prominent.

The legislation of the present century, which culminated in the English Companies' Act 1862, made it possible to obtain corporate rights by mere registration and without the necessity of a Royal Charter or special Act. This led to an enormous expansion of limited liability enterprise in this country (as to the economical effects

of this expansion, see COMPANIES, INCREASE OF). The bulk of this enterprise is no doubt carried on by companies in the usual sense of the word, but limited liability has also penetrated into private partnerships (see PARTNERSHIP).

[Salkowski, *Inst. des Röm, Privatr.*—Goldschmidt, *Universalgesch. des H. R.*—Silberschmidt, *Die Commenda.*—Primker, *Die Aktiengesellschaft* in Endemann's *Handbuch*, vol. i.—Lindley, *Company Law.*] E. S.

LIABILITIES ON SHARES. The liabilities on shares in companies vary according to the nature of the company and the special circumstances under which the shares are held. In companies with unlimited liability each shareholder is, in case of a winding up, liable to contribute without limit; in companies incorporated by charter the liability is determined by the terms of the charter, in many cases each shareholder in the event of a winding up is liable to contribute a sum equal to the amount of his holding in addition to the amounts, if any, remaining unpaid on his own shares. In companies limited by shares a shareholder who has paid up the nominal amount of his holding in cash is not liable for any further amount, unless the company issues bank-notes, in which case the shareholders are liable in the same way as if the company were registered as an unlimited company (see Companies Act 1879, § 6). This rule is of practical importance in the case of companies registered in England, but having branch establishments in foreign countries. If the shares are not fully paid the shareholders are liable for the amounts remaining unpaid; and in the case of a winding up former shareholders are also liable, unless they have ceased to be shareholders for more than a year before the announcement of the winding up; but their liability is restricted to debts incurred during the time of their membership, and they cannot be called upon for any contribution, unless the amount recoverable from the existing shareholders is insufficient to meet the debts owing by the company.

The Companies' Act of 1879, which was passed in order to enable unlimited companies to adopt limited liability—the failure of the City of Glasgow Bank and the consequent ruin of many of its shareholders having caused much misgiving among shareholders in banks generally—has introduced the principle of "reserve liability," viz. a liability which can be enforced in the case of a winding up only. Many of the large joint-stock banks had been established with unlimited liability, and had thereby been enabled to trade with a comparatively small capital. The act of 1879 enabled them to register as limited companies, and to increase their capital, on condition that the increased capital was not to be called up, except for the purpose of a winding up. This facility has been made use of to a very large extent, and the credit of the companies in question has, if anything, improved, as it has been generally thought that many wealthy and careful capitalists who had refused to subject themselves to an unlimited risk, do not object to a definite though considerable liability and become shareholders in the re-constructed banks. Reserve liability may also be introduced by any limited company in respect of any part of its uncalled capital (Companies Act 1879, § 5). Mr. Justice Vaughan Williams in his appendix to the report of the Board of Trade Committee, on Company Law Reform, recommends that a compulsory reserve of this nature should in future be attached to uncalled capital generally (see Report, c. 7779, p. xxiii.)

The original allottee and any subsequent holder with notice of shares credited as fully paid, in consideration of property transferred to a company, is liable to pay up the full amount unless an agreement relating to the issue of such shares was at the time registered at the registry of joint-stock companies (Companies Act 1867, § 25). Persons selling property to companies in exchange for fully paid up shares are frequently not aware of this rule, which in this way causes some hardship, but is on the whole useful.

LI. See CASH.

LIARD. A copper coin worth three DENIERS or the quarter of a SOU. It was first coined under Louis XI. The most probable derivation of the word, which is very uncertain, is from the name of a family in Dauphiné, where it was first used. The liard continued to be a coin in ordinary circulation till the time of Louis Philippe. R. L.

LIBER HOMO. A man who is personally free, as opposed to *servus*, a slave, and also, though in a far less marked way, to *villanus*, as is exemplified by the Domesday entry: *liber homo . . . qui modo effectus est unus de villanis.* The laws of Ina draw a wide distinction between the free man and the *theow*, fixing no wergild for the slaying of the latter. In Domesday the expression *liber homo* is very comprehensive, covering even tenants *in capite*, and in one instance a thegn is strangely recorded as *liber homo teinnus*. Geographically, however, the survey limits the class in a singular way to three of the Danish counties, for 9935 out of the total of 10,097 *liberi homines* are concentrated in Norfolk, Suffolk, and Essex, as are also, with practically no exception, the 2041 *liberi homines commendati*, freemen voluntarily placing themselves under the protection of powerful barons and paying for the privilege. The unfree classes in the survey, the *servi*, *bordarii*, *coscets*, and *cotarii*, and the *villani*, who represent the ceorls in a more or less degraded form and have as a body only a qualified sort of freedom, amount to 222,485. Various unsatisfactory theories have been started to account for the

practical absence of *liberi homines* from thirty-one of the English counties; but it is at least a curious coincidence that the bulk of them appear in the second volume of Domesday, which includes only Norfolk, Suffolk, and Essex, and is a digest of the original returns made on a slightly different plan from the first volume. Vinogradoff (p. 132), remarks that the conquest had cast free and unfree peasantry together into the one mould of villenage, while Bishop Stubbs adds that the Norman knight practically declined to recognise the minute distinctions of Anglo-Saxon dependence, and it is very probable that those who summarised the original returns for the first volume of the survey may have interpreted their instructions in a way adverse to claims of freedom. For further facts bearing upon this point, see LIBERE TENENTES.

A *liber homo* in possession of land was not bound to be in a tithing; his wergild was usually 200s.; his ordeal was by hot iron; but on the other hand he sometimes paid MERCHET. If he held land in villenage his status was not affected — indeed there are cases in Domesday of knights who so held — but he could have no action at law against the lord for recovering or defending an unfree holding. Sir H. Ellis shows that the vavassors who appear in the Suffolk part of the survey were reckoned in among the *liberi homines*, and the class certainly holds the inferior thegns and the allodial tenants. It was of course recruited by manumissions, intentional and otherwise, for the *nativus* of Norman times, as Bishop Stubbs remarks, who could obtain admission into a merchant-gild in a town, and was unclaimed by his lord for a year and a day, became a freeman. The church favoured the liberation of the peasantry, and manorial usages caused the growth of a class of customary tenants, predecessors of the copyholders of a later day, who crept by degrees into the position of freemen, the process being favoured by the tendency to commute labour services for fixed rents. Free land—land, that is, which provided rent not labour—was a continuous influence favouring an alteration in the personal status of its holders.

The gradual rise of the peasantry to the absolutely free condition they reached in the days of Elizabeth and James I. is ably sketched in Hallam's *Middle Ages*, c. viii. pt. 3.

[Ellis, *Introd. to Domesday*, i. 54, 55; ii. 488. —Kelham, *Domesday Book illustrated*, 1787.— Stubbs, *Constit. Hist.*, i. 417, 428.—Vinogradoff, *Villainage in England*, 1892.—Seebohm, *English Village Community*.] R. H.

LIBERE TENENTES. Free tenants or holders of portions of demesne land scattered over the open fields of a manor among the acres held in villenage. The expression *libere tenens* denotes primarily economic condition, a free tenure mainly by fixed money payment as opposed to the tenure of the *villanus*, which comprised base services—that is week-work, tallage often of uncertain amount, the payment of MERCHET and fines on sales of cattle; but a *libere tenens* was generally also a LIBER HOMO (*q.v.*), and was thus usually opposed in status to the unfree *nativus* or *rusticus*, who in his economic aspect was termed *villanus*. Between these two classes there were grades of peasantry, *free socmen*, *molmen*, and *censuarii*, who seem to have been more or less free in status. The difficulty of classification is further increased by the fact that villeins sometimes held free land, and by cases in which *libere tenentes*, as in the Ely survey of 1277, paid merchet and tallage, and attended boon-works with their labourers. On the other hand, the *Extenta Manerii* of 4 Edw. I. in the *Statutes of the Realm*, only recognises *libere* or *liberi tenentes*, *custumarii*, and *cotters*.

There is only a doubtful trace of the term in Domesday (Kelham, p. 255, *libere tenuerunt*), but there are some *liberi tenentes* on a manor in the fragment of a Domesday of St. Paul's. There were none on this manor at the time of the great survey, though there were then twenty-four *villani*. In 1181 there were eighteen *libere tenentes*, and in 1222 there were thirty-four.

In the lists of manorial tenants in the more complete of the returns called the HUNDRED ROLLS, about 1279, the *libere tenentes* emerge as a large class clearly divided from *villani*, though the same man is sometimes seen to be included in the list of tenants in villenage, and in the roll of freeholders. That this did not affect his free status is, however, apparent from records as well as from Bracton's statement that the fact of holding a villein tenement does not make a free man a villein.

The directions in the *Extenta Manerii* for taking the extents of manors are virtually the same as those in *Fleta*, which prescribe an inquiry *de libere tenentibus*; how many of them are within and without the manor; the nature and tenure of their lands, whether by socage, military service, fee-farm, etc.; which hold by charter; what rents they pay; whether they do suit at the lord's court; and what accrues to the lord at their death. These heads of inquiry render evident the legal position of the *libere tenentes*.

As regards economic position, the contrast is between the *libere tenens* and the *villanus*, the free man on land which chiefly pays rent, and the man more or less unfree on land which provides labour.

LIBERTUS, a freedman, *i.e.* a person who

has been manumitted from the legal state of slavery. A master who manumitted a slave became the *patronus* of his freedman, and had, as such, certain rights in respect of him and his property. Freedmen were subject to some legal incapacities.

LICENSES FOR SALE OF GOODS, ETC. See TAXATION.

LICENSES, HISTORY OF. Licenses played a large part in the financial system of the English monarchy. From the 14th to the 16th centuries there was no department of civil life in which a dispensation from obligations, whether of customary or statute law, could not be obtained by the purchase of a license. Some of these were issued upon the theory that the subject matter was within the prerogative of the king as king (see the statute *De Prerogativa Regis*, in "Statutes of the Realm," i. 226). Such were those exempting from customs dues, the control of the ports being part of the royal functions. Others, such as licenses to enfeoff, not uncommon in early times, were granted by the king as feudal over-lord. The Rolls of Parliament exhibit their astonishing variety. As to land, licenses were granted for mortmain, for cutting wood by the lord of a manor within a royal chase, for dealing with reversions of land held in chief of the king, for enclosing and fortifying towns, for enclosing cemeteries, for alienating lands held of the king, for building castles, for enclosing parks or woods, for constructing conduits, and for founding chantries or religious houses. If a grant were made of a market or fair, the right could not be transferred by the grantee without the king's license. In this matter the system was adopted by the grantees themselves; no merchant, for example, being allowed to trade at the fair at Winchester without a license from the bishop. Wardships being within the prerogative, marriage of a ward of the king without license was an offence. A license was requisite to enable lords or commons to leave parliament; to send the precious metals out of the kingdom; to transact business by bills of exchange; to leave the realm; to carry arms in Wales, or cross-bows and guns in England. But those licenses which were the most profitable, and which occasioned incessant disputes, were licenses remitting customs, and those permitting export or import contrary to the tenor of statutes or of proclamation.

The principal licenses for export were those granted to wool merchants. With the exception of north-country wools, the entire export was directed by statute to the staple of Calais (see STAPLE). The object of this was to provide, by the duties levied at the staple, for the maintenance of the garrison, the mint, the fortifications, and the civil administration of Calais and its dependencies. But it was frequently worth the while of merchants to pay a high price to the king on condition of being allowed to export staple goods elsewhere than to the staple; for the staplers, straining their opportunities as monopolists, were accustomed to extort so high a price for wools as to leave a large profit to an exporting merchant whose goods had only been subject to the cost of the license to avoid their exactions. To the king the transaction furnished the advantage of ready money and independence of parliamentary control; while the nation in the long run had to supply the deficit created in the resources of Calais. These licenses were, therefore, repeatedly declared illegal by parliament, but persisted in by successive sovereigns. Other licenses of a similar character were those for the export of sheep and horses, of corn, cheese, and butter, when these were restrained either by statute or by proclamation. A comparison of the licenses granted for the import of wine, during the reign of Henry VIII., seems to point to the conclusion that the grants were regulated, not by the price of wine, but by the fluctuations in the revenue. The *Domestic State Papers* confirm this view, for the recipients were frequently officials of the royal household or tradesmen who had supplied goods to the king, and who were by this means satisfied of their debt.

While from the point of view of the modern constitutionalist, licenses of exemption from statutes were clearly illegal where those statutes expressly prohibited them, the contrary was held by the subservient judges of Henry VII. The growing independence of the Commons in time suppressed the system, but the question of the dispensing power and of its limits was not finally settled till the revolution of 1688 (see TAXATION). I. S. L.

LICENSES (Continental war). One of the clearest rules of International Law is that war puts an end to all commercial intercourse between the subjects of the belligerent states. Moreover the commerce of neutrals with the powers at war is subject to many restraints. But it is within the competence of either of the hostile governments to remove or suspend any of the restrictions imposed upon commerce by the laws of war; and when this is done, the relaxation takes the form of *licenses to trade.* Such licenses are *express* or *implied.* The latter, as being of comparatively slight importance, may be dismissed in a few words. An *implied license* to trade is given when the commander of a force in the enemy's country issues a proclamation inviting the inhabitants to bring provisions and other commodities into his camp for sale. *Express licenses* are either *general* or *special.* The former occur when permission is granted to whole classes of people to trade in particular articles or at particular places; the latter are granted to particular firms and individuals, and authorise them to

carry on a commerce described in the documents they receive and limited by the conditions expressed therein. The best example of a general license on a large scale is found in the permission granted to British subjects at the beginning of the Crimean war, by Order in Council of 15th April 1854, to trade with all unblockaded Russian ports in articles not contraband of war (see Halleck, *International Law*, Baker's ed., ii. 156 note). The Emperor Napoleon III. gave similar permission to French subjects, and the Russian government allowed free ingress to English and French goods, the property of English or French citizens, if brought in neutral vessels. These grants made such inroads on the ordinary rule of non-intercourse that no special licenses were required during the war; and so strong have commercial interests become during the present century, that in all probability similar permissions will be issued at the beginning of future wars between great trading nations, unless indeed private property at sea, not being contraband or destined for a blockaded port, is exempt altogether from belligerent capture, as it was in the war of 1866, between Austria on the one side and Prussia and Italy on the other. Considerations such as these make an examination of the law of special licenses less important now than it would have been at the beginning of the present century. And it must be noted that the practically universal adoption of the rule that the neutral flag covers enemies' goods, unless they are contraband of war, has operated as a general permission to all neutrals to engage in many kinds of trade that were forbidden them by the older practice of nations. Thus the importance of licenses has been still further diminished. Nevertheless they played so prominent a part in the great continental war with revolutionary and imperial France, that it is necessary to describe both the circumstances which led to their issue in enormous numbers, and the rules of law with regard to them which were enforced by the prize courts of the period, and are still referred to as authoritative in treatises on international law (see DECLARATION OF PARIS).

The prohibitions and restraints by which both England and France endeavoured to injure one another through interference with the commerce of neutrals, culminated in the Milan and Berlin Decrees of Napoleon I., and the retaliatory British ORDERS IN COUNCIL. The net result of these deplorable measures was that from the close of the year 1807 each of the two powers claimed the right to confiscate all ships, with some exceptions in favour of neutrals, that traded with the ports of the other or its allies. In addition Great Britain denounced the penalty of seizure and condemnation against vessels which carried a French *certificate of origin*, in testimony that their cargoes did not consist of British goods, and France declared that she would regard as good prize any vessel which touched at any English port, paid any tax to the English government, or submitted to the search of an English cruiser. These maritime measures were backed up on land by the CONTINENTAL SYSTEM (*q.v.*), which Napoleon developed out of the theories and tentative efforts of the Jacobinical leaders. He believed that it was possible to ruin England by excluding her manufactured goods and colonial produce from the continent of Europe. Wherever the arms or the diplomacy of France prevailed, the ports were closed against British commerce, and British goods found within the territory were destroyed. An enormous rise in the price of such commodities was the result, and a vast system of smuggling immediately arose. The attempt to put it down by espionage and military violence had no little effect in rousing the most apathetic populations to resist French domination. Bourrienne describes in his *Memoirs* how the possession of a little sugar from an English West-India island was held to be a crime of the deepest dye, and punished with terrible severity. But British colonial produce and British manufactured goods found their way into the continent of Europe in spite of all that French officers could do under the strictest rules of military occupation. Hamburgh became a centre of a contraband trade with northern Germany, and Bourrienne gives an amusing account of some of the devices which were discovered and stopped. On one occasion an extraordinary increase in the number of funerals attracted attention, and on the hearses being searched they were found to be full of English sugar. Yet so impossible was it to do without supplies which could come only from English sources or through English commerce, that Napoleon's generals were sometimes obliged to trade surreptitiously with England in order to meet the needs of the forces under their command. Great Britain, too, felt the consequences of the dislocation of trade caused by the violence of the belligerents, though she did not suffer to the same extent as her adversaries. The parliamentary debates of the period are full of the complaints of harassed interests and ruined merchants. On both sides circumstances were too strong for rulers. They were compelled to mitigate the severity of their restrictions by the grant of licenses to trade. These were issued in enormous numbers, chiefly to their own subjects, but sometimes to neutrals. The prize courts of the belligerent powers were constantly employed in deciding cases connected with them; and thus an elaborate law of licenses grew up. It will not be necessary to do more than give its main outlines, because in all probability much of its detail will never be wanted again.

The grant of a license is an act of sovereignty, and must therefore emanate from the central authority of the state, the law of each country deciding what department of its government has the right to issue such permissions. The only exception to this rule is to be found in the right possessed by all military or naval commanders, and all governors of occupied places, to give licenses to trade within the limits of their own commands. A state may, however, accept and ratify licenses given by subordinate authorities, in which case they acquire, by the fact of recognition, the validity they did not possess in their own nature. Licenses may be granted to enemies, to neutrals, or to subjects. Their effect is to remove all personal disabilities due to the war, in so far as such removal is necessary for the due conduct of the trade allowed by the license. Thus an enemy subject may sue and be sued in the courts of the country in respect of all matters connected with the transactions for which permission has been given, though the rules of International Law allow the subjects of one belligerent no standing in the courts of the other. But it must be noted that the possession of a license from one belligerent affords no protection against the warlike force of the other. Unless he, too, has allowed the trade in question, he may consider the possession of a permit from his enemy as in itself ground for capture and condemnation. The trade must be conducted according to the terms of the license reasonably and equitably construed. A small excess in the quantity of the goods allowed will not vitiate the license, but a material change in their quality will cause the forfeiture of vessel and cargo. A license cannot be transferred unless it is made negotiable by express words; but it may be used by the agent of those on whose behalf it was granted, provided that he is named in its clauses. The employment of two or more small vessels instead of one large one will be allowed, but the use of an enemy ship instead of a neutral ship will be regarded as fatal. A license to send goods to a particular port covers the return voyage in ballast, and will even protect both ship and cargo if it was impossible to deliver the goods at the destination named. Stress of weather and other unavoidable causes will excuse delay in the termination of a voyage, but it must always be commenced at the time stated in the license.

[The literature of this subject is very voluminous. C. Robinson's *Admiralty Reports* give many of the British cases, and others will be found in the *Admiralty Reports* of Dodson and Edwards. Hautefeuille discusses licenses in the continental war from an ultra-French point of view, in his *Droits et Devoirs des Nations Neutres, Discours Préliminaire.* A vigorous presentation of an English view, almost equally biassed, will be found in the famous work, *War in Disguise, or the Frauds of the Neutral Flags.* The law of the matter is summarised in Halleck's *International Law*, ch. xxx.; Wheaton's *International Law* (Dana's ed.), §§ 408-410, and note 198; Hall's *International Law*, § 196; Lawrence's *International Law*, § 235. An article by Rose in the *Historical Review* for October 1893, on "Napoleon and English Commerce," gives a clear and concise account of the continental system and its results.]

T. J. L.

LIEN (derived from the French word *lien* [Lat. *ligamen*] = tie) is the right to retain goods until payment of a debt due by the owner of the goods. It differs from a right of pawn or pledge inasmuch as it does not give a power of sale to the person retaining the goods. By the common law every one has a lien on articles delivered to him to work on for the amount of the value of such work. This is called a specific lien. Other liens are created by special agreement or usage of trade; these as a rule are general liens, that is to say, they authorise the detention of goods in respect of debts not specifically incurred in relation to the goods. Bankers', brokers', and innkeepers' liens belong to this category.

LIGHT GOLD AND SILVER COIN, WITHDRAWAL OF, FROM CIRCULATION IN THE UNITED KINGDOM AND COLONIES.

United Kingdom.—Gold Coin. From 1816, when the present gold currency was introduced, until 1842, the law of the United Kingdom as to withdrawing light gold coin from circulation required every person receiving a sovereign below the least current weight (122·5 grs.) to cut and return it to the tenderer, the latter having no alternative but to suffer whatever loss the deficiency in the weight involved. This law remained practically inoperative. To carry it out would have required every person receiving either a sovereign or half-sovereign to possess a delicate balance with which to test the weight of the coin. The Bank of England and some Government Offices were the only places where the law was not ignored; great care, therefore, was taken by the public to prevent light gold coins from falling into the hands of the only institutions where it was liable to be cut. Full-weight pieces were also carefully selected for export and for melting for industrial purposes. Hence the gold currency became more and more exclusively composed of worn pieces.
